NOW

96-Hour Penicillin Blood Levels with

Flo-Cillin "96"

Here is a revolutionary improvement in repository penicillin formulations *a single 1 cc injection (300 000 units) produces and maintains therapeutic blood concentrations for 96 hours in 90% of patients* This outstanding achievement does away with the need for every day injections in repository penicillin therapy, the recommended dosage of a single 1 cc injection *every other day* is judged to be adequate for the majority of clinical purposes

In Addition

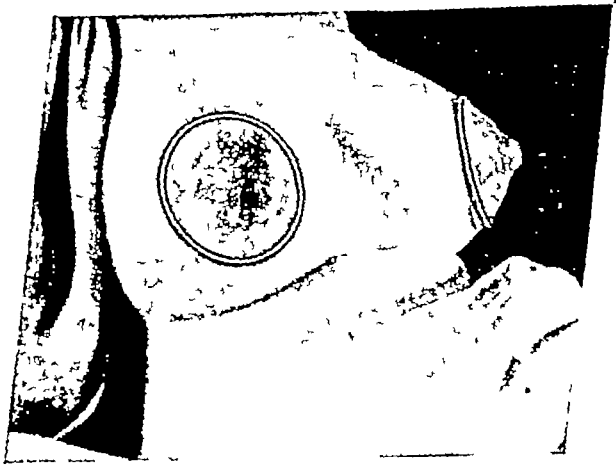
Flo-Cillin '96' is a stable, always fluid suspension which doesn't "settle out" No extemporaneous mixing or prolonged shaking is required A uniform dispersion of penicillin is assured in each and every dose.

FLO-CILLIN "96"

Procaine Penicillin G in Oil

(*300 000 units per cc*)

with Aluminum Monostearate, 2%



Available NOW from your usual source in vials containing ten 1 cc doses in a sterile disposable package containing a 1 cc cartridge and one B-D Disposable Cartridge Syringe and in 1 cc cartridges alone for use with the B-D* Metal Cartridge Syringe*

Reg U S Pat Off., Becton Dickinson & Co

More breast fed babies . . .

with the Plastishield technic

By reducing the incidence of sore nipples and keeping the nipple soft, pliable, and in an everted position, the percentage of nursing mothers has been materially increased wherever the Plastishield technic of aseptic breast care is in use

Advantages of THE PLASTISHIELD TECHNIC

Plastishields protect the nipple and areola against irritation

Plastishields are easily sterilized

Plastishields do not react to skin or milk.

Plastishields eliminate the need for ointments or other medication

Experience is the Best Teacher

William Withey Gull
(1816 1890)
proved it in pathology

SIR William Gull is medically recognized for his many original observations which led to his classic description of myxedema and a greater understanding of nephritis He also added much to the fundamental knowledge of neuropathology—such as his observations that locomotor ataxia was a disease of the posterior columns of the spinal cord Medical knowledge was greatly enriched by Gull s experiences

Experience is the best teacher in cigarettes, too!

Yes Experience is what counts—just as it always has And with millions of smokers who have tried and compared many different brands of cigarettes, Camel is the "choice of experience."

Try Camels! Discover for yourself how the rich full flavor of Camel s choice, properly aged and expertly blended tobaccos pleases your taste See if Camel s cool cool mildness isn t mighty welcome to your throat

Let your own experience tell you why *more people are smoking Camels than ever before*

R. J. Reynolds Tobacco Co. Winston-Salem, N. C.

According to a Nationwide survey:

More Doctors Smoke CAMELS

than any other cigarette

Three independent research organizations in a nationwide survey asked 113,597 doctors what cigarette they smoked The brand named most was Camel!

combined hemopoietic actions

Heptuna *with Folic Acid*

Heptuna with Folic Acid combines the therapeutic efficacy of folic acid, iron and vitamins Folic Acid has been proven to be effective for many types of macrocytic anemias and hypochromic anemias in which the blood forming organs require specific stimulation Heptuna with Folic Acid not only furnishes the hemopoietic and nutritional effects of iron (ferrous sulfate) and vitamins, but also the necessary hemopoietic stimulant—folic acid

HEPTUNA and HEPTUNA WITH FOLIC ACID are now available at prescription pharmacies

a **ROERIG** *preparation*

EACH CAPSULE CONTAINS:

Folic Acid	1.7 mg
Ferrous Sulfate U.S P	4.5 Grains
Vitamin A (Fish Liver Oil)	5 000 U S P Units
Vitamin D (Tuna-Liver Oil)	500 U S.P Units
Vitamin B_1 (Thiamine Hydrochloride)	2 mg
Vitamin B_2 (Riboflavin)	2 mg
Vitamin B_6 (Pyridoxine Hydrochloride)	0 1 mg
Calcium Pantothenate	0 333 mg
Niacinamide	10 mg

Together with other B-complex factors from liver and yeast

More than just palatable. .

this protein therapy is virtually *tasteless*

When 100 or more grams of protein per day must be administered to a critically ill or convalescent patient taste and bulk are real problems.

Essenamine is an essentially tasteless protein concentrate In virtually pure form adaptable to any type of diet Essenamine supplies large quantities of the *needed* amino acids. May be administered in milk, broths fruit and vegetable juices *meat loaf baked goods custards* ice cream etc.

The required amount of Essenamine should be mixed with a small amount of cold water to form a smooth paste then add liquid or other ingredients gradually

ESSENAMINE®

spasmolytic relief

for the irritable bowel

The severe, painful spasm associated with the hypertonic or hyper active bowel suggests the need for the combined spasmolytic-sedative action of—

PAVATRINE *with Phenobarbital*

Pavatrine, a potent, well tolerated, synthetic spasmolytic, is unique in its combined *neurotropic* and *musculotropic* antispasmodic action on painful, smooth muscle spasm The inclusion of the mild central nervous sedation of phenobarbital combines to afford effective symptomatic relief in the management of the irritable bowel as well as in such prevalent conditions as pylorospasm, dysmenorrhea and bladder spasm

SEARLE *Research in the Service of Medicine*

Pavatrine is the registered trademark of G. D Searle & Co Chicago 80 Illinois

Announcing Abbotts ***New*** *SIMPLIFIED DEVICE*

for Penicillin Powder Inhalation

Abbott s radically new device the AEROHALOR, offers an improved method for administering penicillin to the upper respiratory tract and lungs Its simple, easy operation permits oral or nasal inhalation therapy in the patient s home or in your office.

The device consists of a discharge chamber with interchangeable mouthpiece and nosepiece Abbott Sifter Cartridges each containing 100 000 units of finely powdered Crystalline Penicillin G Sodium are prescribed separately for use with the AEROHALOR

For oral inhalation the patient attaches the mouthpiece to the discharge chamber of the AEROHALOR, inserts a cartridge and smokes the AEROHALOR like a pipe For nasal inhalation the same procedure is followed, except that the nosepiece is used.

This form of treatment is indicated for infections of the respiratory tract produced by organisms susceptible to penicillin It is contraindicated only in infections not susceptible to the action of penicillin and for patients with an established sensitivity to the drug. Reactions appear to be minimal—3 to 6 percent in one series of over 500 cases. No serious reactions have yet been encountered

The AEROHALOR and Abbott Sifter Cartridges are now available. Supply may be limited—keep in touch with your local pharmacies Write for literature ABBOTT LABORATORIES, North Chicago Illinois

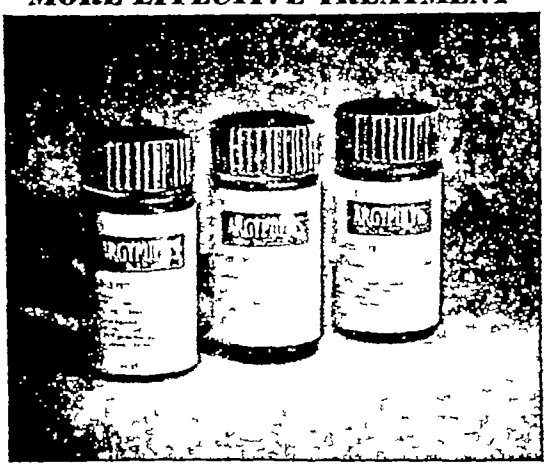
**Arnsno, L., Karp, M. and Rhoads P. S., (1945) Inhalation of Dust Penicillin, Ann. Int Med., 28 607-617 March.*

(a) Discharge chamber is attached either to (b) Mouthpiece or (c) Nosepiece for use with (d) Abbott Sifter Cartridge.

AEROHALOR

Abbott's Powder Inhaler

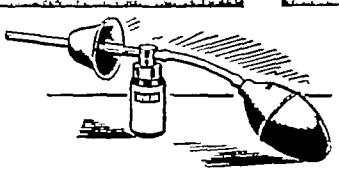
As patient inhales, stream of air enters curved intake tube causing metal ball to strike against Sifter Cartridge. This shakes out a small amount of penicillin powder into stream of air Powder is carried into respiratory passages, deposited on surfaces of the mucous membranes and absorbed into the blood stream.



For nasal Inhalation. Operates on same principle as mouthpiece. Patient holds openings against nostrils inhales removes exhales.

IN TRICHOMONIASIS

ARGYPULVIS *new adaptation of* ARGYROL

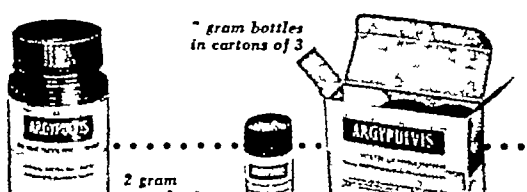


MORE EFFECTIVE TREATMENT

BETTER CONTROL

For Use by the Physician
7 gram bottles fitting
Holmspray or equivalent
powder blower

For Home Use by the Patient
2 gram capsule for insertion by the patient



In both treatment and continuous control of Trichomoniasis the effectiveness of ARGYPULVIS as a protozoacidal agent has been definitely established *

Use of the preferred powder form, which is employed both for insufflation and in capsules for insertion by the patient, offers definite advantages—not only in eradication of the causal agent but also in control and prevention of recurrence

Furthermore, the detergent and demulcent properties of ARGYPULVIS are additional advantages in the treatment of those cases in which cervicitis and vaginitis are associated with Trichomoniasis

Composition . . Physical Properties

ARGYPULVIS contains powdered ARGYROL (20%), Kaolin (40%) and Beta Lactose (40%) finely milled, to provide the fluffiness which makes for easy insufflation, and with an attraction for water which promotes fast action

INTRODUCTORY TO PHYSICIANS On request we will send professional samples of Argypulvis (both forms), together with a reprint of the Reich, Button, Nechtow report (Use coupon)

SCABIES
AND THE
WARM SUMMER MONTHS

The seasonal increase in the incidence of scabies is effectively combated with Kwell Ointment. This unusually efficacious scabicide overcomes the infestation in most patients with a single application. No instance of dermatitis or secondary skin inflammation due to the active ingredient has been reported. Kwell Ointment presents 1 per cent of the gamma isomer of 1, 2, 3, 4, 5, 6-hexachlorocyclohexane in a vanishing cream base. This substance is quickly lethal for the Sarcoptes scabiei, but in the concentrations employed, is harmless to man. Kwell Ointment is equally valuable in the eradication of all forms of pediculosis.

Available on prescription through all pharmacies in 2 oz. and 1 lb. jars.

KWELL OINTMENT

Case History of an overweight streetcar-operator . . .

'Dexedrine' Sulfate—because it curbed appetite and lowered food intake—enabled even this extremely obese patient to lose weight easily and safely without the use (and risk) of such potentially dangerous drugs as thyroid

Patient before treatment (age 53, height 5' 10½") weighed 352 pounds . . was suffering from hypertension, nervousness and dyspnea . lived in fear of causing an accident while on duty Overeating was the only demonstrable cause of his obesity

Therapy 'Dexedrine' (15 mg. A C t i d)	Results	Weight	B. P	Pulse
March, 1946	'Dexedrine' therapy begun	352	280/152	86
November, 1946	8th month of Dexedrine' therapy	269	160/84	86
January, 1948	22nd month of 'Dexedrine' therapy	234	158/84	86

In addition to the weight reduction of 118 pounds and the concurrent lowering of blood pressure, a remarkable improvement is reported in the patient's mood and outlook. Earlier nervousness and fears have vanished

Dexedrine* Sulfate tablets and elixir . the most effective drug for control of appetite in weight reduction

Smith, Kline & French Laboratories Philadelphia

The Hanson family of "I Remember Mama" faced the future with confidence—a confidence all due to Mama. "If anything goes wrong," said Mama, "there's always my Bank Account to pull us through."

Things worked out fine for the Hansons. And they never realized that Mama's Bank Account was Mama's own myth

But the average family can't be fooled with a myth. The average family needs *real* savings, *real* security protecting them.

That's why so many families have begun to save the automatic, worryless way—with U S Savings Bonds that pay back four dollars for every three in just ten years

And to make it simpler still, your government offers you two fine plans for their purchase (1) The Payroll Savings Plan at your firm. (2) For those not on a payroll, the Bond-A-Month Plan at your bank.

AUTOMATIC SAVING IS SURE SAVING - U.S. SAVINGS BONDS

THE MIRROR UP TO NATURE

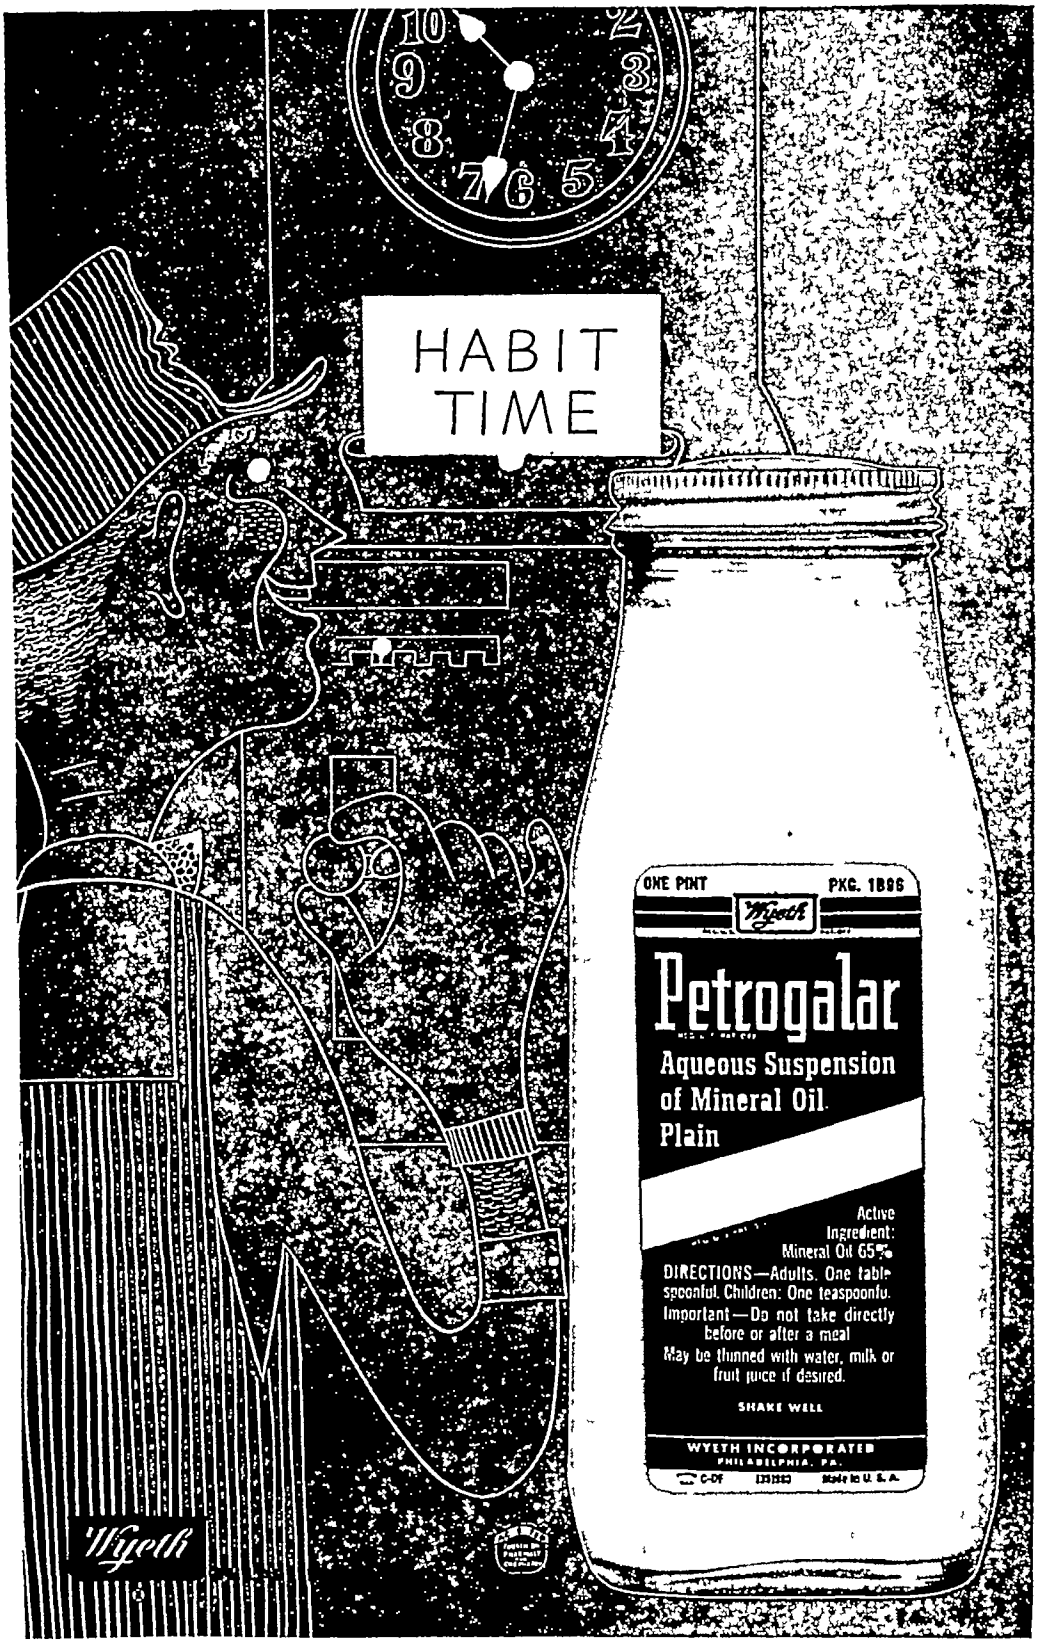
the pure corpus luteum hormone identical in action with the progestational principle isolated from the mammalian ovary

PROLUTON* provides true replacement therapy. Chemically pure PROLUTON (progesterone) rapidly induces a secretory phase of the endometrium in the same manner as produced by the hormone of the normally functioning corpus luteum of the female. Progesterone thus is "extremely effective"[1] in controlling functional uterine bleeding. Fluhmann[1] states that progesterone given intramuscularly in daily doses of 10 mg. for several days "invariably" leads to a cessation of the bleeding.

Because the corpus luteum hormone is a "powerful uterine relaxant,"[2]

PROLUTON

has had brilliant success in forestalling threatened and habitual abortion,[3] and in relieving dysmenorrhea.[4] As PROLUTON is corpus luteum hormone, it is innocuous even in large dosage.[3]



PACKAGING: PROLUTON (progesterone in oil) ampul 1 cc. containing 5 mg. per cc., box of 3, 6 and 50 ampuls; 10cc vial of 10 cc. containing 25 mg. per cc., box of 1. Ampul Pak-over* (anhydrohydroxyprogesterone) tablets 5 or 10 mg., boxes of 20, 40, 100 and 250 tablets; and 25 mg., boxes of 20 and 100 tablets.

freedom from gastric distress

for maximum hemoglobin production

Besides iron, glycine is essential for the synthesis by the body of protoporphyrin which in turn enters into the formation of hemoglobin *

Capsules Ferrous Glycinate-MRT suspended in edible oil Passed through the stomach without releasing the ferrous glycinate No irritation or nausea Positive absorption in the duodenum.

Elixir So free from astringency that it will not curdle milk Mixes freely with fruit juices and other medicaments Especially recommended for children.

Each capsule contains ferrous glycinate 100 mg (in oil) equivalent to 25mg ferrous iron Each teaspoonful of elixir (5cc) contains 8 grains (183mg) of organic ferrous iron and 10 grains glycine (aminoacetic acid)

How its special vehicle makes

Acnomel

a significant advance, clinical and cosmetic, in acne therapy

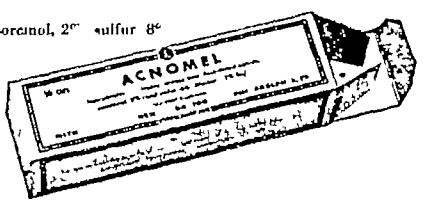
ACNOMEL's superior vehicle embodies an entirely new principle in topical acne therapy To this vehicle —a stable, grease free, flesh tinted hydrosol— Acnomel owes the following important advantages

1 It is easy to apply smoothly and evenly

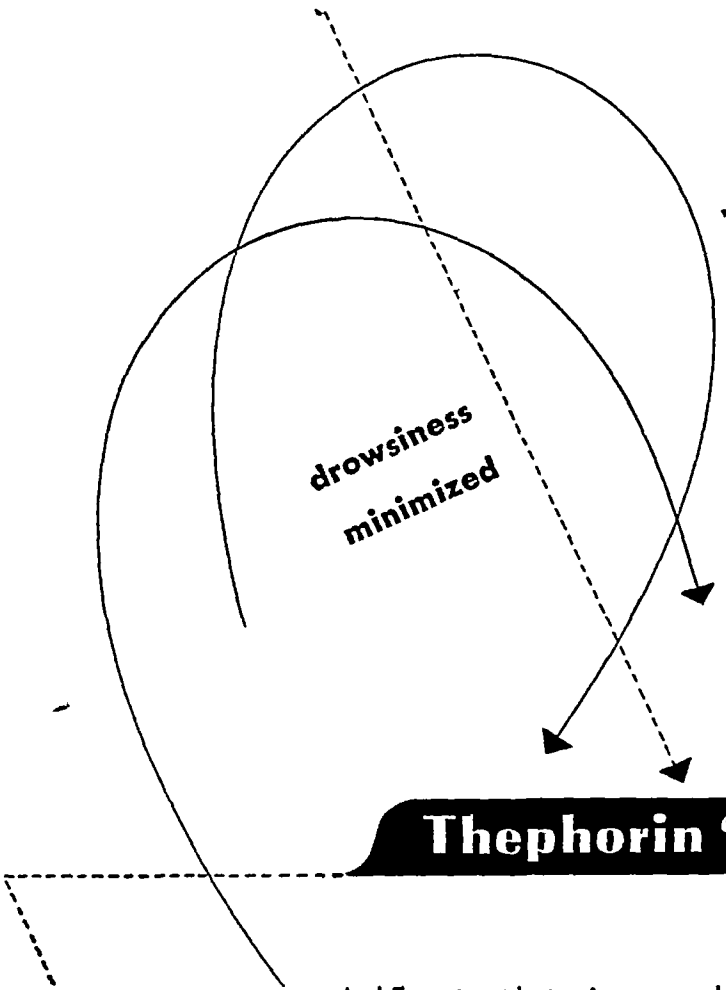
2 Upon application it dries in a few seconds

3 Its active ingredients are maintained in intimate and prolonged contact with the affected areas

4 It removes excess oil from the skin



5 It is readily washed off with water



Available on prescription only in specially lined 1¼ oz. tubes

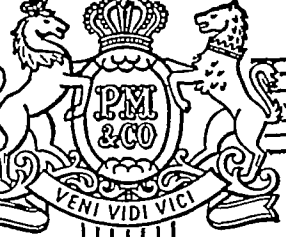
Remarkable results in dysmenorrhea

In a clinical study extending over a period of a year, Long* used Edrisal as the sole medication in treating 630 employees for dysmenorrhea. Results were dramatic. He concluded, "We use it [Edrisal] with the knowledge that nine out of ten sufferers will get the relief they seek."

Edrisal combines the recognized analgesics—acetylsalicylic acid and phenacetin—with the unique anti-depressant, Benzedrine Sulfate. Consequently, it not only relieves the pain during the menstrual period, but also combats the accompanying psychic depression.



Best results are usually obtained with a dosage of *two* tablets, repeated every three hours, if necessary.

Professional Services in Hospitals

A recent issue of the *New England Journal of Medicine* discusses one of the current problems of the medical profession and the hospitals, about which something will have to be done [1] Says the above source in part

particularly vexing have been the difficulties encountered as a result of Blue Cross payment of certain professional services rendered within hospitals and the relation between hospitals and staff physicians in certain branches of medicine The criticism has been made by these staff physicians—anesthesiologists, pathologists and roentgenologists in particular—who may be on full-time or part-time salaries, that employing hospitals have made a profit on their salaries and that Blue Cross, by arbitrarily including their services in its coverage, has classified the product of their training and experience as a hospital rather than a professional service

They have thus been classified, it appears from their contention with the clerks of a store or the employees of an industry from whose earnings a legitimate profit might be expected

In an attempt to evaluate any grievance that any party may have, the purpose of professional organization should be clearly defined It may be assumed that the first object of all medical organization is to provide the patient with the best possible care A second legitimate object is to assure for the physician a decent and dignified standing in his community and a living commensurate with his ability and its industrious employment

It is admitted that Blue Cross has blundered, it is apparent also that some hospitals have erred in failing to establish proper relations between staff and administration The mistake is common when businessmen, occupied chiefly with balance sheets have jurisdiction over institutions that are staffed by professional men jealous of the ethics and etiquette of their profession Even the physician turned director is too often found at least in the eyes of his former colleagues worshipping the golden calf instead of heeding the commandments written in stone. [1]

The matter is important Until some intelligent attack is made the blundering will continue, to the detriment of the medical profession, the hospitals, and particularly the patients who, in this instance, are the innocent bystanders

[1] New England Journal of Medicine, April 29 1948, p. 640.

A committee was appointed by the Council of the Massachusetts Medical Society in the spring of 1947 "to define hospital services and medical services and to establish the proper relations between physicians and hospitals" This committee, composed of representatives of the anesthesiologists, the pathologists, and the roentgenologists, the Blue Cross, the Blue Shield, the Hospital Association, and the Massachusetts Medical Society, labored long and faithfully during the hot and humid summer that ensued It brought in a unanimous report that has so far been unimpeachable and that defined as medical hospital services those "other than administrative, rendered by a registered physician directly to or in behalf of an individual patient for the obtainment and interpretation of data, including consultation and advice, for the diagnosis, treatment, and prevention of disease"

These services, specifically, were defined as embracing "the general and special practice of medicine, surgery, and obstetrics, and the practice of the related specialties including anesthesiology, physical medicine, radiology, pathology, and clinical pathology "

A basic principle recommended in the report was that each department (so far as possible) be self-supporting and that neither the hospital nor the physician rendering the service should exploit the patient or each other The basis of financial arrangement, however, migl salary, commission, fees or any other n that would best meet the local situation

Certain questions are not easily ans Is a nurse anesthetist, operating under tor's orders, acting as his agent in a r capacity or is she engaged in the prac medicine? The point is open to debate a chemist, conducting his own clinical l tory, perform an analysis and report the to the physician submitting the materia does not presume to make a diagnosis? organized pathologists believe not, but again, there is room for disagreement [1]

Discussion of this report by similar g in the various states might be highly in evolving a workable and fair practi which all parties at interest could b It seems to be a matter in which the medical societies could well assume l ship The pioneering work has beer done by the Massachusetts Medical S and should be followed up The probl pressing, for the medical profession to it would be to evade a grave respons and to invite attempts at solutio agencies less well qualified to bring to in a judicial spirit all parties at interes

Current Editorial Comment

Topectomy The therapeutic effect of frontal lobe leucotomy (psychosurgery) has aroused the interest of psychiatrists in all parts of the world Unfortunately, the outcome has been found to be unfavorable in some 30 per cent of cases, as well as having a mortality of 3 to 5 per cent In an effort to rationalize this organic approach to mental disease, a medical-surgical-scientific group of 96 collaborators known as the Columbia-Greystone Associates was constituted at the Columbia-Presbyterian Medical Center and Greystone Park State Hospital in New Jersey

A group of "back-ward" patients at Greystone Park were subjected to a most elaborate and intensive study including practically every variety of laboratory, medical, and psychiatric examination available From the patients, half were selected for operation, and half were retained as controls A systematic schedule of brain operations, designated as "topectomy", was devised sc bilaterally symmetric portions of the fi lobes were excised in such a fashion tha entire area of the brain could be studiec the localized or mass effect of such c tions

Four months after operation, 20 of t operated patients were considered b hospital parole board to be improved tc a degree that they could be paroled fro hospital Only four of the 24 contrc tients were recommended for parole were no patients in a worsened condit a result of the operation

Intensive follow-up studies showed those patients in which Brodmann's nine, ten, and 46 had been excised sh the greatest improvement This imp ment was chiefly marked by a loss of chotic anxiety and complaint There w clear or permanent loss in intellect, abil learn or remember, in abstract attitu

motor speed or coordination, or in verbal facility shown by any operated patient Indeed, rather than mental impairment, the general over all picture was one of mental amelioration which the investigators attribute to the decrement in psychotic effect

The success of the procedure is most encouraging, and further applications of the technic are now being planned, although still as a research investigation

Confidential Report "What the Birth Record Means for a Child" by Helen C Huffman, social science analyst, National Office of Vital Statistics, U S Public Health Service is the title of a paper given at the National Conference of Social Work, April 13 to 19, 1947, at San Francisco [1] In this paper Miss Huffman discusses the value of the birth record to the individual in later life and points out some instances in which the lives of people are affected in an endless variety of ways by the information or misinformation contained therein

Will Rogers, says Miss Huffman, said of a birth certificate "The purpose of a birth certificate ain't to prove that you've been born—but when, where at, and who to"

But answers to questions on the certificate may be misleading at times A young man didn't get a job for which he was applying because his birth certificate under 'Occupation of Father' had been answered 'In an insane asylum' The fact was that the father was the chief psychiatrist in a hospital for mental illnesses, not a patient"

Miss Huffman then proposes to take technics of registration from various states and to arrange the data in 3 sections She says

> The certificate could be arranged so that the legal items of name and date and place of birth could be placed at the top of the form. As a second portion information about the parents could be entered Then, in a confidential part of the document, the doctor could record numerous items of important statistical health information The question of legitimacy or illegitimacy would also be placed in this confidential part When a person needs proof of birthplace and birth date, the certified copy could then be made by taking a picture of only the first section The second portion could be included in the picture when a person needs proof of parentage *The confidential information would never be given into public hands* [2]

[1] The Child, 2 137 (June) 1947
[2] Italics ours—Ed.

Miss Huffman deplores the fact that birth certificates, as they are issued indiscriminately at present in various states, display numbers of facts that should never become public knowledge But then she goes on to say that birth certificates should carry much more information than they do now We would agree with her, if we had the same confidence that she has in the 'Democratic State' We haven't Nor in any kind of 'State'

Once you have every bit of available information registered in regard to every unfortunate child born into this changing world, you have a statistician's paradise Once you have those statistics *on file*, Damocles' sword is dangling over the head of every citizen

Again we quote Miss Huffman

> The confidential information would never be given into public hands

We wish we shared her confidence We fear that, once those statistics were on file, both public and private hands would be reaching into them

We have every sympathy with her desire for uniform birth certificates We see perfectly how, if she carried her point, masses of statistics in this country could be much better than they are now We like everything about Miss Huffman and her article except her sentence, which we quote again

> The confidential information would never be given into public hands

We stress this point, because it is our only point of disagreement with Miss Huffman's otherwise excellent suggestions for improving birth records There is no question of the value of better statistical information But in our view a birth record is a public document Therein lies its value to society and to the individual himself We fail to comprehend how such a record can be both a public document and a private, reserved record at the same time

Confidential information of the sort here under discussion, constituting the third part of the record, might or might not remain so We have not the unreserved confidence in human nature evidently possessed by Miss Huffman Also we are old enough to avoid using the word 'never', we would urge similar avoidance upon social science analysts

The President's Page

The Medical Society of the State of New York may be likened to a great ship that has braved the seas through many, many years

Its keel is made of timbers that represent the great principles that have always guided us, namely, to preserve the ideals of the medical profession, to seek its honor, to maintain ethical standards, and to defend its rights and privileges—to raise ever higher the educational requirements for those seeking to practice medicine—all to the end that we may give an ever more perfect service to the people

On this keel a superstructure has been laid by a succession of great self-sacrificing men, and its joints have been caulked and held firm over the years by the work of innumerable committees in the deliberations and decisions of the House of Delegates

The whole medical profession of New York State are passengers on this ship Only a small percentage of the doctors are earnestly helping to keep this ship of medicine on her course These few are working diligently, but the medical profession needs the thoughtful cooperation of all

All owe much to the members of the medical profession, whose high standards have made them what they are, and, in addition, all have a deep obligation to the doctors who will come after We must hand down to them a great heritage

People as a whole love and respect us and want to continue to do so To lose that love and respect may be easier than to retain it, but retain it we must at all costs

Our dignity, our future, our freedom to give our fellow men the high service to which they are entitled depend upon it It is our greatest bulwark against those who would regiment us Every doctor is, in fact, a public relations man for the medical profession

I want to emphasize the importance of the individual physician—one actuated by the thought that the practice of medicine is a vocation, not a business In the last analysis it is the doctor who is the determining factor of the worthwhileness of the whole system of the care of the sick He is the sine qua non

With these few thoughts I bring you my greetings as your president From time to time during the coming year "My Meditations," so to speak, will appear on this page I hope they may have some interest and appeal

LEO F SIMPSON, M D

ESTROGENS IN DIABETES

HAROLD MARCUS M D , and SOL GLOTZER, M D , Brooklyn, New York

(From the Medical Service of the Jewish Sanatarium and Hospital for Chronic Diseases)

IN RECENT years, the literature pertaining to the extrapancreatic endocrine factors in diabetes mellitus has grown to large proportions It is not our desire to add to these volumes but we have been impressed with the difficulty of evaluating properly the results obtained by the use of sex hormones in the treatment of diabetes because of the tendency for carbohydrate tolerance to increase under therapy with diet and insulin alone

The accessory treatment of diabetes with sex hormones has a rational basis Houssay and his school, a number of years ago, established some important facts In hypophysectomized animals, blood sugar levels fall, probably due to a diminution in neoglycogenesis and not due to any effect on insulin production In fact there occurs a marked increase in sensitivity to insulin against which the hypophysectomized animal can be protected by prior injection of the necessary anterior pituitary extract. Diabetes produced by pancreatectomy will disappear if the hypophysis is removed and will reappear if the hypophysis is implanted, or if suitable extracts are injected The factor responsible for these effects is called the "diabetogenic factor,' supposedly produced by the anterior pituitary gland

Young succeeded in producing a permanent diabetic state in dogs by repeated injections of an anterior pituitary extract over a long period, and in many of his animals the diabetes persisted even after discontinuation of the injections [1] Marked degeneration of the islets of Langerhans was noted suggesting that the action of these extracts was through the pancreas

Another mode of action of the diabetogenic factor must also be considered. Aggravation of diabetes is noted in pancreatectomized hypophysectomized animals in which the anterior pituitary extracts are injected Since it obviously cannot act through the pancreas, it possibly acts through the liver, stimulating transformation of glycogen into glucose and at the same time, inhibiting the utilization of glucose by the tissues As proof it has been shown that the effect of anterior pituitary hormones is abolished by hepatectomy in animals

The presence of a specific diabetogenic factor can only be surmised from these experiments but as yet no specific hormone has been isolated The association of growth and diabetogenic action in extracts of the anterior pituitary gland has been noted [2] The extract is believed to contain a pancreatotropic hormone which increases insulin secretion and, by increasing nitrogen retention causes a gain in weight It is also believed to contain a diabetogenic hormone which either increases carbohydrate formation or depresses its oxidation Much of the diabetogenic activity of the pituitary gland is mediated through the adrenal cortex which by itself can also stimulate glyconeogenesis in the liver and inhibit glucose utilization These findings indicate a close association between a number of glands to produce an effect on metabolism which might seem to be the action of only one hormone. How much part the growth factor plays is not known, but that it is important is indicated by the decrease in insulin content of the pancreas produced by the administration of purified growth preparations

Diabetes frequently has been seen with clinical manifestations of pituitary disturbances White looked for evidences of pituitary hypersecretion in juvenile diabetics [3] She found that many were taller than normal and had more advanced bony and dental development prior to the onset of diabetes but these evidences did not persist after several years She also found dwarfism in 94 of 177 cases and suggested, as an explanation for this apparent contradiction, that the pituitary body had become exhausted Diabetes occurred in 17 per cent of cases of acromegaly in one series 9.2 per cent in another Rocca and Perez reported a case of acromegaly with diabetes which showed resistance to the insulin sensitivity test and responded to treatment with estrogenic hormone [4]

The use of estrogen to depress the diabetogenic hormone arises from this possible association of the former with the growth and sex hormones in the secretory cell. Subcutaneous implantation of tablets of diethylstilbestrol estriol, and estra-

Estrogenic hormone used in this study was Progynon B, generously supplied by Dr W H Stoner of the Schering Corporation.

diol in rats caused an increase in insulin content in the pancreas, an action believed to be mediated through the anterior pituitary, since hypophysectomy neutralized the effect Ligation of the ovaries in rats produced specific changes in the hypophysis, preventable by injection of estrogens

Zondek found that estrogen inhibits the gonadotropic and growth factors of the pituitary [5] Long-continued injection of estrogen causes enlargement and increased vascularity of the gland, with an increased number of chromophobe cells and actual formation of adenoma Zeckwer reported an increased number of chromophobe cells showing mitoses and hypertrophy of the Golgi apparatus and mitachondria, following estrogen injection, and found that production of follicle-stimulating and growth hormones decreased, while lactogenic hormone increased [6] Segaloff and Dunning prevented pituitary enlargement by the simultaneous administration of testosterone [7]

Foster studied the effect on the pituitary of rats of implanting synthetic estrogens and found enlargement with a marked increase in large chromophobes which are considered degranulated chromophil cells [8] He described the secretory cycle as consisting of the regular accumulation and release of specifically stainable granules by the chromophil cells, the effete cells being replaced by the growth and differentiation of small chromophobes, which are inactive and not secretory An equilibrium exists normally between granulating and degranulating chromophils until, with exhaustion of the cell, permanent degranulation occurs, ending in conversion to the inactive chromophobe cell A similar equilibrium exists between large and small chromophobes Hypertrophy of the Golgi bodies, which is the best indicator of secretory activity in the cell, also points to this increased stimulation Since growth and follicle-stimulating factors are believed to be produced by the chromophil cells, a decrease in their activity should be accompanied by a decrease in diabetogenic factor Spark compared the effect on the pituitary of estrone and estradiol benzoate in equivalent doses and found that all cases receiving estradiol, but only one those of receiving estrone, showed hyperplasia [9] Diethylstilbestrol had the same effect in rats, i e , enlargement of the pituitary, with degranulation of chromophil cells and an increase in chromophobe cells Chorionic gonadotropin was found to initiate regranulation of chromophil elements, returning the gland to a normal appearance following the changes caused by estrogen

Diabetes occurs with greater frequency near the menopause Tuttle found, in 38 of 72 female diabetics, that the onset of diabetes and menopause coincided [10] An increased amount of gonadotropic hormone is found in the blood and urine at the menopause, indicating overactivity of the anterior lobe possibly due to the loss of restraining action of ovarian hormone With these effects in mind, Barnes, Regan, and Nelson first attempted the treatment of diabetes by estrogen [11] Many investigators have independently reached the conclusion that diabetes which appears with, or shortly after, the menopause is more amenable to this therapy Spiegelman, in a study of nine patients, found a greater reduction of insulin requirement (63 per cent) in the premenstrual group than in the postmenstrual group (42 per cent) [12] Gerber treated ten patients who were either menopausal or showed signs of hypovarianism or hypopituitarism with 30,000 to 60,000 international units of estrogen weekly for three months He reports marked improvement [13]

Striking in most reports of cases treated in this manner is the relatively short period of observation employed prior to administration of estrogen Diabetics are notoriously difficult to control, and in an ambulatory patient not hospitalized, such control for investigative purposes is made more difficult It is of utmost importance in evaluating the effect of a drug to be absolutely sure that all other factors are stationary In diabetics, this would mean a level of control which is unchanged for at least five months and close observation for any intervening physical factors which might alter the control We were fortunate in having a group of individuals in this series who were confined to an institution for chronic diseases for some time and were, therefore, under close observation for a sufficient period prior to the experiment to be sure of control

Material

We selected for the experiment seven women who had been hospitalized for conditions which rendered them incapable of much activity All were proved diabetics, had been on insulin for a long time, had received the same dosage for at least six months, and diabetes had developed either after the onset of menopause or had been aggravated by it in all cases Diet consisted of the regular ward menu, with no restrictions The usual menu consisted of approximately 1,400 to 1,500 calories daily with about 150 Gm of carbohydrate, 50 to 60 Gm of fat, and 65 to 75 Gm of protein After thorough examination to rule out pelvic pathology, the patients were injected with Progynon B, 6,000 rat units, intramuscularly twice weekly for a period of three months from March 26 to June 20, 1947 Blood and urine sugar were determined weekly Since no change was made in any other factors in the environment, any change which occurred could be ascribed to the hormone.

Case Reports

Case 1.—J J, aged 62 was admitted in November 1943 with bilateral pyramidal tract signs and a fracture of the right ankle. Menopause followed hysterectomy at the age of 43. Diabetes was discovered one year later and insulin became necessary at the age of 50 years. Hypertension had been present for eighteen years. Positive findings consisted of blood cholesterol of 305 mg. per cent, a small sella turcica and a sugar tolerance test which rose from a fasting level of 101 mg. to 427 mg. per cent at the end of three hours.

Between June 1944, and the beginning of the test period on March 26 1947 the blood sugar varied from 101 to 200 mg. with the use of 40 units of protamine zinc insulin daily. This dosage was continued until May 12 1947 when the blood level fell to 65 mg. Insulin was decreased to 30 units but a subsequent rise in blood sugar necessitated a return to the original dosage which was continued until the end of the test. The only improvement noted was a decrease in glycosuria during estrogen therapy and an increase following discontinuance.

Case 2.—L. G. aged 67 was admitted in 1944 with hypertension, left ventricular hypertrophy and arteriosclerotic cardiovascular disease. At 61 years a midthigh amputation of the leg was performed for diabetic gangrene and one year later she suffered an intertrochanteric fracture of the right hip. At 28 years, amenorrhea followed cesarian section. Diabetes was first discovered at 52 years and insulin was used from the start.

From November, 1944 until March 26, 1947 20 units of protamine zinc insulin were given daily. Sugar tolerance test showed a rise from a fasting level of 132 mg. to 333 mg. per cent at the end of three hours. Estrogenic hormone was begun on March 26, 1947 and on April 21 the blood sugar fell to 50 mg., necessitating a decrease of insulin to 10 units. No increase in insulin has been necessary to date two months after discontinuation of estrogen.

Case 3.—B. S. aged 77 was admitted in November 1946 ten months after a cerebral thrombosis with left hemiplegia. Menses had stopped at 38 years and diabetes was first discovered at 53 years. Her past history included several bouts of pneumonia, diabetic gangrene of the left heel which responded to conservative treatment and long-standing hypertension. Blood pressure was 170/90, the heart showed calcification of the aortic knob and left ventricular hypertrophy, and x ray of the skull revealed a normal sella turcica. Sugar tolerance curve rose from a fasting level of 117 mg. to 346 mg. per cent at the end of three hours. Since admission, protamine zinc insulin requirement remained at 20 units daily, and the blood sugar varied from 93 to 182 mg.

Estrogen was begun on March 26 1947 and on April 21 the blood sugar fell to 78 mg., necessitating a decrease of the daily dosage to 10 units where it has remained to date, two months after discontinuation of hormone injections. However, glycosuria recently increased.

Case 4.—I. S. aged 66 was admitted in March 1941 for hypertensive cardiovascular disease and blindness due to enucleation of the left eye and a cataract of the right eye. Menses ceased at 35 years. A bilateral oophorectomy was done for polycystic, papillary cystomata with hemorrhage at 55 years. Additional findings were benign adenoma of the thyroid and x ray evidence of decalcification of the sella turcica. Electrocardiogram revealed an old myocardial infarction. Diabetes was first discovered at age 63 and insulin was required from the onset. Sugar tolerance test showed a rise from a fasting level of 125 mg. to 355 mg. per cent at the end of three hours. Insulin requirements fluctuated from 15 to 45 units of protamine zinc insulin during 1943 and from December, 1943 to August 1945 she received a constant daily dosage of 20 units. Twenty five units were required from then until the beginning of estrogen therapy on March 26 1947.

The blood sugar fell to 60 mg. per cent on April 21 requiring a reduction of insulin dosage to 15 units where it has remained to date, more than two months after discontinuation of the injections. In spite of the reduction in insulin need, and in blood sugar level, glycosuria remained high throughout the period of observation.

Case 5.—R. R. aged 60, was admitted in January 1945 for left hemiplegia and hypertensive heart disease. Menses ceased at 50 years. Diabetes was first discovered at 54 years after she had suffered a stroke but insulin was not required until nine months later. Since June 1945 25 units of protamine zinc insulin were given daily and blood sugar levels ranged from 154 to 180 mg. per cent. With a sugar tolerance test the figures were as follows: fasting 140 mg. per cent, one-half hour 157 mg., one hour 204 mg., two hours 174 mg. and three hours 165 mg. During administration of hormone therapy no change in insulin requirement occurred. Subsequently this patient developed gastric complaints and hepatic disease with jaundice and died on September 30 1947 of gastric malignancy. This hepatic invasion by neoplasm may have had some influence on the result.

Case 6.—S. M. aged 62 was admitted in November 1946 for right hemiplegia which followed an influenzal infection during pregnancy at age 33. Hypertension was present with evidences of cardiovascular involvement. Diabetes was discovered at age 52 but no insulin was required until November 1946 ten years later. Sugar tolerance test showed a rise from a fasting level of 227 mg. to 371 mg. per cent at the end of three hours.

Estrogens were begun on March 26 1947. No change in insulin requirement resulted throughout the entire period. However during the period of hormone administration the level of blood sugar remained lower than in the periods before or after its use.

Case 7.—H. S. aged 60 was admitted in September 1944 with hypertensive cardiovascular disease, an equinovarus deformity of the right foot which resulted from poliomyelitis and subsequent attempts at surgical correction and a recent fracture of the left foot. Menses ceased at 52 years. Diabetes had been discovered five years previously at age 47 but no insulin was required until age 57. Since Novem-

ber, 1946, 40 units of protamine zinc insulin were given daily

Estrogens were begun on March 26, 1947, and on April 21 the blood sugar fell to 64 mg per cent, requiring reduction of insulin dosage to 30 units Vaginal bleeding occurred on May 20, easily controlled with 25 mg testosterone given intramuscularly To date, two months after cessation of treatment, no increase in insulin has been necessary

Results

The ages of these women ranged from sixty-two to seventy-seven years In two, the menopause followed surgical procedures, while in the other five it was natural In six of the cases, diabetes was first discovered after the onset of menopause In Case 7 the diabetes was premenopausal in onset, but no insulin was required until five years after cessation of menses Incidentally, this patient was the only one in whom vaginal bleeding occurred

The most notable effect in all the patients was the general feeling of well-being which resulted All said they felt much better during treatment, and this must be considered significant in view of the depressive atmosphere which usually exists in this type of institution In four cases (2, 3, 4, and 7), the daily insulin requirement was reduced to 10 units, and in one other (Case 1), the reduction was only temporary Two cases (5, 6) showed no change in insulin needs This reduction, while on the surface not remarkable, constitutes a decrease of between 25 and 50 per cent in insulin requirement and must be considered significant To date, we have followed these cases for two months after cessation of estrogen therapy, and as yet it has not been necessary to increase the insulin dosage Glycosuria increased after estrogen was stopped in three of the patients, and it is possible that this may presage a decrease in sugar tolerance in the near future Case 5 became sugar-free without any reduction in insulin dose

An interesting development occurred in six of our seven patients At the end of exactly four weeks of treatment in five cases and at the end of the seventh week in one case, the blood sugar level dropped considerably and relatively sharply, reaching almost to hypoglycemic levels It was at this point that reduction in daily insulin requirement became necessary, after which the blood sugar returned to a more level plane Case 6 did not require the reduction Several explanations for this phenomenon have been considered An increase in insulin sensitivity may have occurred, such as has been seen following hypophysectomy, and has been ascribed to depression of the anterior pituitary secretions Insulin tolerance tests were not made and should have proved helpful in establishing this point Another possibility is that the tolerance to glucose increased rapidly to a point at which the usual daily insulin dose became excessive, and the rapid accumulation of long-acting insulin in the body might have produced a hypoglycemic state Here, also, additional studies, particularly sugar tolerance curves, should have been of value Further and more detailed investigations along these lines are indicated

Summary

1 Seven patients were selected in whom diabetes had either been present before the menopause or had been aggravated by it They were selected because the diet and insulin requirements had remained unchanged for five months or more and because all were continuously confined in a hospital during the entire control and test period

2 Estrogenic hormone was given in doses of 6,000 rat units, intramuscularly twice weekly for a period of three months, during which weekly blood sugar estimations were made

3 In four of the seven patients, a reduction in daily insulin requirement of 25 to 50 per cent resulted, and no increase has been necessary for two months, to date, following cessation of this therapy

4 An almost precipitous fall in blood sugar occurred in six of the seven cases, at the end of four weeks in five cases and at the seventh week in one The explanation for this phenomenon may be sought in an increase in insulin sensitivity or in an increased tolerance to sugar

5 In all patients, administration of estrogenic hormone produced a remarkable feeling of well-being, with uterine bleeding occurring in only one case

6 Estrogenic hormone is effective in decreasing the severity of diabetes in postmenopausal patients to a moderate degree The actual value of this form of therapy as an adjunct or substitute for insulin therapy in individual cases can only be determined by such experiments as ours, repeated many more times, and perhaps, by such means, more accurate selection can be made of the type of patient who would benefit most

THE USE OF A NEW ANTIHISTAMINIC COMBINATION IN THE TREATMENT OF ALLERGIC DISORDERS

EARL B BROWN, M D and FREDERICK W BROWN M D, New York City

IT HAS been generally accepted that histamine or a histamine-like substance plays some part in the allergic reactions in hay fever and allied disorders [1] Recently, attempts to control many allergic symptoms by the use of an antihistaminic drug have been successful There is no doubt about the value of diphenhydramine hydrochloride as an adjunct in the therapy of this group of disorders

The experimental evidence for listing diphenhydramine as an antihistaminic has been presented and reviewed adequately by others and it is unnecessary to review that work here.[2 3] The use of the drug clinically has been reported previously by O Leary and Farber, Levin Koelsche *et al.*, Thacker, Waldbott, Schwartz and Levin and Farmer and Spitzchen, with results varying from 73 5 to 41 6 per cent improvement [4–16]

Aminophylline has proved to be a very effective therapeutic agent in bronchial asthma when administered intravenously and by rectal suppository [11–13] Oral therapy has been ineffective except in some mild chronic cases, this is probably due to the fact that its dosage must be limited, since large doses are likely to cause considerable gastric irritation [12]

Previous reports of the use of diphenhydramine hydrochloride (Benadryl) in therapeutic doses indicate that side effects occur in from 30 to 67 per cent of patients receiving the drug, the principal disturbances being dizziness and drowsiness [7 9] In an effort to overcome these side reactions, it was decided to try a chemical combination of diphenhydramine and aminophylline (Hydryllin)

achieved by others using diphenhydramine hydrochloride alone

All patients were instructed to use one tablet three to four times daily If no relief and no severe side effects occurred, this dosage was increased to two tablets three to four times daily

In order to evaluate further the usefulness of this drug, the report is broken down into time units as shown in Table 1 The patient was told to take the drug after meals except when the dosage was four times per day, depending upon the duration of the relief The drug was not used in higher doses than eight tablets daily

In a statistical study based upon subjective symptoms there is a great deal of error However, analysis of the time relationship of onset and duration of relief following the ingestion of the drug gave us some idea of the effectiveness of the drug in each individual case The relief percentages are arbitrary figures except for the 100 per cent The 75 per cent group includes those patients who obtained almost, but not complete, relief or who stated that they had better than 50 per cent relief The 20 per cent group includes those patients who thought they obtained only a little relief Unfortunately, all patients were not observant or interested enough to report on the time of onset of relief or duration of relief While the amount of relief these patients obtained was tabulated, the time unit studies were not included for them

Concomitant pollen surveys as suggested by Chobot were not integrated with the reports given in Table 1 [14] However on days when there was obviously no pollen in the air i e, rainy days a patient was asked to continue to take the medication so that a proper evaluation of symptoms could be tabulated

TABLE 1.—RELIEF OBTAINED IN 121 PATIENTS TREATED WITH DIPHENHYDRAMINE HYDROCHLORIDE

Symptom	Number of Patients	Relief Obtained 100%	75%	50%	20%	0	Onset of Time of Relief (in Minutes) 15	15 to 30	30 to 60	Over 60	Duration of Relief (in Minutes) 15	15 to 30	30 to 60	Over 60
Hay fever	81	39	12	11	5	14	13	16	18	7	3	8	26	15

Total	121	56	19	22	8	24	16	25	23	8	5	8	36	20

This is a report of 121 patients with allergic disorders treated with this combination of drugs and a comparison of our results with those

All patients studied, 97, or 80 per cent reported improvement which compares favorably with the best over-all figures obtained for diphenhydramine hydrochloride, namely, 73 5 per cent [16] The major difference between our results

This survey was done under the auspices of the Committee on Therapy American Academy of Allergy

The Hydryllin was furnished through the courtesy of G D Searle and Company Chicago Illinois

and previous reports appears to be in the relief of pollen and infectious asthma A combined total of 25 out of 34, or 82 per cent, were improved, which is considerably higher than that reported by other investigators [4–10] Following this study, a group of chronic asthmatics were put on Hydryllin and appeared to obtain excellent relief from their symptoms However, as any change of therapy in a patient suffering from a chronic disease is liable to produce dramatic results, we thought that our period of observation of this group on Hydryllin was too short to warrant proper evaluation Therefore, they were not included in the observations It is our opinion, however, that Hydryllin is much superior to either diphenhydramine hydrochloride or tripelennamine in adult asthmatics and just as effective in children as those two drugs

The toxic reactions were varied and are listed in Table 2

TABLE 2 —Toxic Reactions

Symptoms	Number of Patients
Drowsiness	27
Nausea heartburn or cramps	5
Shakiness	2
Dizziness	2
Drowsiness accompanied by gastrointestinal symptoms	3
Excessive dryness	1
Wheezing	1
Spasm of salivary duct	1

Forty-two of the 121, or 35 per cent, complained of side reactions Thirty-two of these (26 per cent) complained of drowsiness or dizziness Only 21 patients had to discontinue use of the drug entirely because of the side effects Waldbott reports that out of 165 patients observed, 90 (55 8 per cent) suffered from side reactions [8] Of these, 81 patients complained of dizziness or drowsiness Levin mentioned many other side effects but stated that out of 223 patients, 144, or 64 6 per cent, noted drowsiness, Koelsche stated that out of 83 patients, 25 (30 per cent) noted drowsiness [5 6] From these figures it can be noted that the addition of aminophylline to the diphenhydramine hydrochloride has undoubtedly cut down on the amount of drowsiness repeatedly reported by other authors However, when the above reports were made, the unit dosage of Benadryl was 50 mg rather than 25 mg as in Hydryllin It has not been proved whether the use of the 25-mg dose would have been just as efficacious, as well as less toxic, as the higher dose We have also combined 50 mg of diphenhydramine hydrochloride with 5 mg of amphetamine sulfate to combat the drowsiness, but it is our opinion that this combination was not as effective

Summary

1 The effects of a new chemical combination of aminophylline with diphenhydramine (Hydryllin) are reviewed in 121 cases

2 Ninety-seven patients out of the total, or 80 per cent, showed definite improvement with one to two tablets, three to four times per day The most striking improvement, as compared to diphenhydramine hydrochloride alone, was in the adult asthmatics, who showed 82 per cent improvement

3 The side effects were notably reduced with this drug as compared with diphenhydramine hydrochloride alone

39 West 55th Street

COURSE OF INFANTILE PARALYSIS TO BE CHANGED BY EXPERIMENT

Start of a five-year experiment that may change the whole course of treatment for persons with infantile paralysis and other disabling diseases has been announced by the National Foundation for Infantile Paralysis The experiment is to be carried on with a March of Dimes grant of $20,000 a year at the Orthopedic Hospital at Los Angeles under supervision of Dr Charles L Lowman, chief of staff emeritus at that hospital The study will center on the theory that patients with infantile paralysis or allied diseases should be treated mentally, emotionally, socially, educationally, and vocationally at the same time they are undergoing medical treatment.—*New York Times, January 29, 1948*

DEVICES FOR THE RAPID RECORDING OF THE UNIPOLAR ELECTROCARDIOGRAM

ABRAHAM LIEBERSON, M D , A A C P , and A ALLEN GOLDBLOOM, M D F A C P
New York City

(From the New York Medical College Flower and Fifth Avenue Hospital Metropolitan Hospital Division)

THE MODERN trend in electrocardiography which promises to advance the science most is tailoring the electrocardiogram to the particular need of the patient. Thus although the majority of patients can be studied adequately with the standard four lead electrocardiogram, there is a substantial number who require special leads, physically closer to a particular chamber of the heart and hence more revealing

Many such accessory leads have been suggested in the past fifteen years and a number of investigators including the authors are in the process of studying the proposed leads comparing the relative values so as to determine which are so informative that they justify inclusion in routine electrocardiography [1] Although our data in this comparative study is far from complete one is able to say that the multiple chest leads and unipolar limb leads have already proved themselves so useful that they deserve wide adoption in routine electrocardiography

Perhaps the greatest obstacle to the wider employment of these accessory leads is the extra time spent recording them Geiger and Goerner speeded up the recording of the six chest leads materially by using an elastic belt which obviated the necessity of individual placement of the electrodes on the chest [2] To obtain still greater speed and simplicity in operation, we have incorporated a modification of the belt into a special apparatus designed to record rapidly, besides the conventional leads six chest leads and the three augmented unipolar limb leads.* This apparatus has proved itself so satisfactory and time-saving that we consider it well worthwhile to give the details of the devices and the technic used

Technic

Figure 1 shows the switch box interposed between the patient and electrocardiograph which accomplishes the rapid recording of the desired 12 leads without moving wires or electrodes An 11 wire cable (Fig 2) coming from the patient is plugged into the switch box One wire comes from each extremity a fifth wire is connected to the exploring electrode (marked "C" for chest) and six wires from the six electrodes on the elastic precordial belt to be described later In order to prevent external interference which makes for an unsteady base line and wandering of the tracing great pains have been taken to shield the cable and switch box completely and to provide a suitable ground for each of the leads taken Thus, when the right and left arms are used in taking the standard lead 1, the electrical connections in the switch box are such that the left leg acts as ground in taking lead 2 the left arm is grounded, and in lead 3 the right arm is grounded The other nine leads taken are all unipolar leads (Wilson) with the right and left arms and the left leg all connected through equal resistances to form the

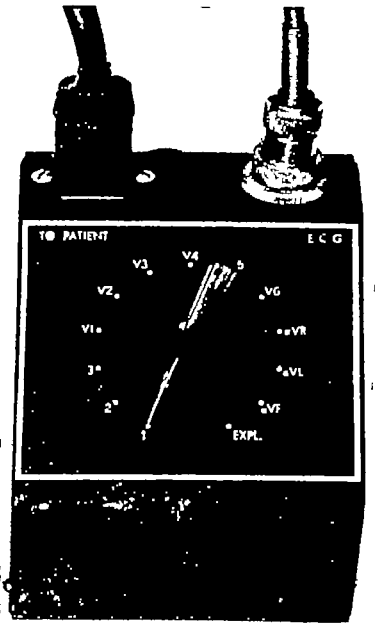

FIG 1 Selector switch

*Made by Medical Designs, 612 Eastern Parkway Brooklyn, New York.

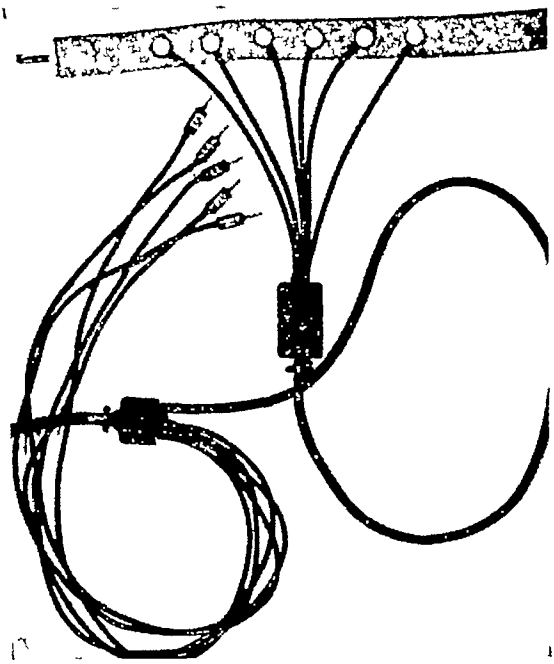

FIG 2 Six-electrode precordial belt and 11-wire patient's cable

indifferent electrode, the terminal of zero potential [3] In these leads the right leg acts as ground If it is desirable in any particular case to explore any point outside of the nine taken as the standard points above, one uses the lead marked "C" From the switch box a three-wire, shielded cable, marked ECG in Fig 1, runs to the input plug of the electrocardiograph All manipulations for the selection of the leads are made at the switch box, the electrocardiograph always recording the selected lead on the lead 2 (right arm-left leg) setting

To facilitate the rapid recording of the chest leads from six positions on the precordium we use a modification of the elastic rubber belt described by Geiger and Goerner [2] It is made of high quality, uniformly thick rubber, one inch wide and 42 inches long Six, round German silver disk electrodes, one inch in diameter, are spaced one and a half inches apart toward one end of the belt From each electrode a wire runs to join the other five wires of the patient's cable which plugs into the switch box (Fig 1, marked "To Patient") A hook on the free end of the rubber belt fits into the proper hole, permitting easy adjustment of the elastic belt to the size of the chest The only precordial placements which need be determined are electrode one (right edge of sternum in fourth interspace) and electrode six (midaxillary line in the fifth interspace) These two points are easily located by the average technician The other four electrodes lie automatically at equal distances from one to six

If the amplifier type of electrocardiograph is used, only a thin layer of electrode paste need be applied to the electrode, and no further rubbing of the skin is necessary With the string machine the electrodes may need more electrode paste or rubbing up and down to reduce skin resistance, especially on hairy chests If failure of the belt to exert sufficient pressure against any of the disks causes wandering of the tracing, the patient is instructed to press the disk firmly against the chest through a dry towel The female breast offers no difficulty in this technic, for the breasts are always lifted and the belt is set into position beneath the axillary folds A typical 12-lead electrocardiogram taken with the above described apparatus and technic is shown in Fig 3

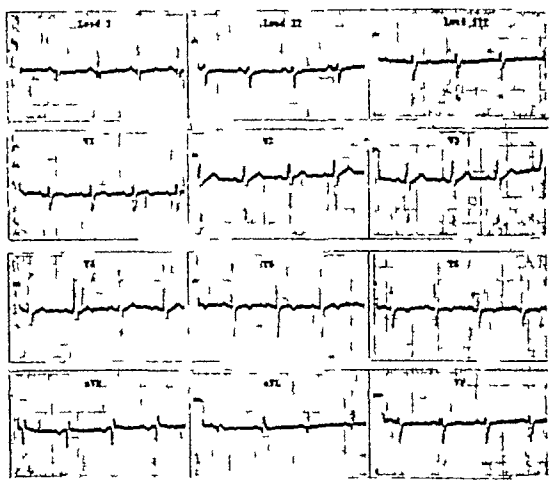

FIG 3 Twelve-lead electrocardiogram

Discussion

The 12 leads which have been selected as the most informative and easily obtained leads in any complete study of the heart are eminently practical With the devices and the technic outlined above it is possible to take the 12-lead electrocardiogram in just a little more time than the ordinary four-lead tracings The use of the precordial belt for taking the multiple chest leads permits great speed in taking these chest leads, once the technic of applying the belt to different chests is mastered Geiger and Goerner showed that there are insignificant differences between records obtained by the belt technic and the six individual precordial placements advocated by the American Heart Association [2-4 5] They stress the fact that with the belt the fixed relation of the electrode to the thorax rather than the heart is sounder theoretically than the standard method, especially in study of axis deviation, ventricular hypertrophy, bundle branch block, etc

Our studies verify these findings We were able to duplicate results better with the belt technic than with individual placements on the precordium, whether this is done by technicians or by the authors themselves The method is, therefore, particularly suited to exercise tolerance tests Since the patient is exercised with the belt in position, a true tracing from the same six precordial areas before and after exercise can be obtained

We hardly need justify the inclusion of the augmented unipolar limb leads of Wilson (aVR, aVL, aVF) in the 12-lead electrocardiogram for complete routine cardiac investigations, for they have already proved themselves of great value in the study of axis deviation, Q-wave abnormalities, right ventricular hypertrophy bundle branch block, and abnormalities of the RS-T segment and T waves [3 4] The devices and technics described above permit the exploration of any part of the body (by use of switch position marked "Expl."), and of nine placements in particular (six precordial, three limbs) It thus appears to answer the growing demand for the unipolar (exploratory) type of electrocardiogram

Summary

A technic for the rapid recordings of a 12-lead electrocardiogram is described An 11-wire cable runs from the patient to a selector switch six of these wires being attached to electrodes in an elastic precordial belt By use of the selector switch the three conventional leads six precordial leads taken with the Wilson terminal as the indifferent electrode and the three Wilson augmented unipolar limb leads are taken in rapid succession without having to move any wires or electrodes It is hoped that the widespread use of these time-saving devices—the switch box, elastic precordial belt, and 11 wire patient's cable—will rapidly build up a mass of data to help establish the norms and standards for these promising accessory leads.

The technic is particularly suited to the special study of axis deviation, Q-wave abnormalities right ventricular hypertrophy, bundle branch block, RST segment and T wave abnormalities. It answers the growing demand for the unipolar electrocardiogram

IT'S A MEASLES YEAR

Dr Harry S Mustard New York City Commissioner of Health has asked us to point out that so far during 1948 there have been 9 295 cases of measles resulting in seven deaths in the city

Inasmuch as the highest mortality and the largest number of complications occur in very young children Dr Mustard urges that gamma globulin be administered to all children between six months and five years of age who are household contacts to measles.

Gamma globulin is supplied free of charge by the Department of Health and may be secured at any of the health centers and also at the headquarters building 125 Worth Street, New York City This preparation is available in 2 cc. vials and should be given within six days of the onset of the disease In very young children this dose entirely protects the child and in older children if the disease is not prevented, a mild case occurs in most instances.

The immunity conferred by gamma globulin lasts about three weeks.—*New York Medicine May 5 1948*

STREPTOMYCIN AND SURGERY IN THE TREATMENT OF TUBERCULOUS JOINTS

ARTHUR A MICHELE, M D , and FREDERICK J KRUEGER, M D , Brooklyn, New York

(From the Orthopedic Service of the United States Marine Hospital, Staten Island)

STREPTOMYCIN hydrochloride as an adjunct to the surgery of bone tuberculosis has given favorable results in a series of 12 cases Tuberculosis of the shoulder and hip was treated with surgery and streptomycin hydrochloride, and these cases are presented as a preliminary report

The authors believe that the rapid recovery, not only from the general toxic and debilitating symptoms but also from the local subjective and objective pathologic findings, may be attributed to streptomycin, used in conjunction with surgery, as the active element in this recovery

Case Reports

Case 1 —A 44-year-old seaman from Puerto Rico spent his early years in a rural environment He drank pasteurized milk for the first time in New York in 1941 He was one of 14 siblings, seven of which were accidentally killed The remainder are living and well His father died at 97, of old age His mother died at 88, following an operation He had the childhood diseases, including small pox, without sequelae He had enjoyed very good health up to the present illness

In the summer of 1944, following a return voyage from Italy, he developed multiple draining abscesses over the sternum and entire right shoulder girdle He was treated at a New York City hospital with "shots" for the sinuses, however, they did not disappear until several months following his discharge from that institution in November, 1945 Three months later, on January 7, 1946, while on the high seas, he fell across a rope, landing on his right shoulder Immediately, his shoulder became swollen to twice its normal size There was an area of marked tenderness in the region of the subdeltoid bursa for several days The shoulder was particularly painful at night Within a week many purulent sinuses with foul pus appeared over the entire scapular area and axilla, the pectoral region, and the supra- and infraclavicular areas extending over the sternum

He was admitted to the surgical service of Marine Hospital on January 30, 1946 There were multiple draining sinuses about the right shoulder He suffered loss of appetite, general malaise, and listlessness The remainder of the admission history was not remarkable

Pertinent physical findings on January 30, 1946, were as follows Blood pressure, 115/78, pulse, 82, respiration, 18, and temperature averaging 37 5 C The general physical condition was good with the exception of pale oral mucous membranes, glistening sclera, and a chronically infected right shoulder with less than 10 per cent normal range of motion at the scapulohumeral articulation

Roentgenograms of the lungs showed a mild, healed, pulmonary fibrosis of the left apex Roentgenograms of the right shoulder were described as follows There is some rather old periosteal new bone formation of the greater tuberosity of the humerus and a chronic subdeltoid bursitis with some involvement of the supraspinatus tendon, since the soft tissue shadow is particularly dense in the region just above the humerus

During the six weeks in the hospital the patient slowly improved under hot compresses and sulfadiazine The diagnosis was not confirmed in the laboratory However, clinically, he was considered to have bone and joint tuberculosis The patient requested his discharge and returned to sea for the summer months

In January, 1947, he returned to the outpatient department, stating that his shoulder had drained most of the past year and that he had had an incision and drainage at another New York City hospital on October 14 and 19, 1946, and on January 16 and again on January 26, 1947 He stated further that in November, 1946, he was also treated for a "fused kidney with a double ureter" with shots of penicillin

He returned as an outpatient to this hospital the early part of February, 1947 (Fig 1) Cultures, guinea pig inoculation, and smears were taken from the pus and returned positive for tuberculosis, and he was referred to the orthopedic service on April 2, 1947 On April 5, 1947, he developed an acute appendicitis, and an appendectomy was done and the abdomen explored The anomalies of the kidney and ureters were seen, and some fairly large abdominal mesenteric nodes were noted The appendix was acutely inflamed

After an uneventful course following appendectomy, on April 29, 1947, an intra-articular arthrodesis of the right shoulder was carried out The physical findings preoperatively were essentially the same as previously described, except that the right shoulder now had three anterior scars and seventeen openings about the shoulder area, draining moist purulent material, foul in odor The shoulder was twice its normal size, painful on motion and severely painful at night Temperature was 36 C with afternoon rises to 38 2 C He appeared toxic, discouraged, and weak

Laboratory findings were essentially normal except for roentgenographic increase of destruction in the proximal end of the humerus and glenoid fossa Complete blood count showed 4,100,000 red blood cells with 12 Gm per cent hemoglobin, 11,000 white cells with 28 per cent lymphocytes and 72 per cent neutrophils The sedimentation rate was 28 mm. per hour He now weighed approximately 30 pounds less than one year previously

FIG 1 Tuberculous destruction shoulder joint.

In considering the approach to treatment in this case it was decided that an intensive chemical therapeutic regime would be instituted using streptomycin as an adjunct to surgery Although Hinshaw in his report on four cases of bone tuberculosis makes little mention of its use we feel that streptomycin most certainly should be used in conjunction with established orthopedic procedures [1]

Streptomycin was given intramuscularly in 1/2 Gm. doses every three hours for three days preoperatively This dosage was continued for three more days postoperatively Then the dosage was reduced to 300 000 units every three hours up to 90 Gm. No other bactericidal drug was given One-quarter grain doses of morphine sulfate were given every four hours for one and a half days for postoperative pain and multivitamins were continued throughout the period of hospitalization

On April 29 1947 the operative procedure consisted of a primary debridement of the scapulohumeral articulation The head of the humerus and glenoid labrum was devoided of all tuberculous tissues including cartilage and the joint was fixed at 130 degrees abduction with Steinman pin fixation The Putti method of extra-articular arthrodesis was then carried out by a subperiosteal exposure of the entire spine of the scapula. An osteotomy of the base of the spine from the body of the scapula was performed. The acromioclavicular articulation was spared The spine of the scapula was detached from its base denuded of periosteal tissues The acromion was inserted into an osseous flap approximately 1 1/2 inches in width and 1 inch in depth which included the cortex raised upon the shaft of the humerus with the base of the flap distal The extremity was immobilized in an abduction plaster cast.

By the eighth postoperative day, all the sinuses about the shoulder had stopped draining, and the skin wound had healed cleanly Further, a previously thick bulky shoulder had returned to normal size and the patient was cheerful, hungry, and stated that he felt much better than he had for the past year By the end of the sixth week, he had gained 25 pounds, and it was necessary to change the body part of his shoulder spica

By the end of the eighth week, roentgenogram showed a fusion of the affected joint, however the cast was continued for another month Complications of the streptomycin therapy consisted of pain at the site of injection (with or without novocaine) burning during the last week of injection and, occasionally vertigo on sudden change of position At the end of three months the patient had gained 32 pounds. Night pains in the shoulder subsided after the second postoperative night. The Steinman pin inserted into the scapulohumeral articulation was removed at the end of the sixth week. There was no further drainage from the shoulder or chest (Fig 2) The pathologic report of the specimen removed from the shoulder was positive for tuberculosis The patient's temperature returned to normal at the end of the eighth day

At the end of the fourth month postoperatively the patient was found to have a painless, stable and satisfactorily functioning arthrodesis of the right shoulder (Fig 3) He returned to his duties as a

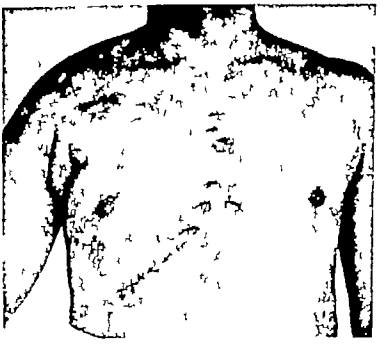

FIG 2. Healed scars from draining sinuses anterior view

FIG 3 Arthrodesis of the tuberculous shoulder joint

seaman On re-examination seven months after surgery, the shoulder was found to be asymptomatic, and the patient was in excellent health

Case 2 —A 41-year-old Norwegian seaman whose illness dated back to 1938, at which time following a severe cold he lost his voice, was hospitalized, and a diagnosis of pulmonary and laryngeal tuberculosis was made. Following hospitalization of twenty months at the Charleston Marine Hospital in South Carolina, he was discharged as an arrested tubercular and returned to duty until July of 1945

In December of 1945, there was an onset of dull aching pain in the region of the left hip which was more pronounced during the night and particularly in bad weather Associated with this, he had a severe left sciatica, transient in type, and superimposed on this, several attacks of "herpes" on the affected side, lasting usually for a period of three to seven days at a time After the fifth or sixth attack he was hospitalized at the U S Marine Hospital at Martha's Vineyard, Massachusetts, in January of 1945 On February 10, 1945, he was transferred to this hospital with a diagnosis of pulmonary tuberculosis and tuberculosis of the left hip joint At that time he had a dry cough, weight loss, and marked swelling and pain in the region of the left hip

Pertinent physical findings in February, 1945, were as follows a 41-year-old man, weighed approximately 120 pounds, normal weight being about 135 pounds The blood pressure was 110/70 He appeared anemic and weak with his left hip swollen twice the normal size. The patient had a definite limp with a peroneal type of foot drop and atrophy of the lower thigh and calf on the left side He had a generalized adenopathy particularly pronounced in the neck and inguinal regions, there were definite pains on motion of the left hip and a moderate amount of edema in the region of the left ankle joint His speech was coarse and whispered

His physical status remained essentially the same until June of 1946, at which time the right hip became involved mildly On June 12, 1945, a right hip spica was applied In spite of the immobilization in the cast, a flattening of the head occurred with increased pain in the articulation (Fig 4)

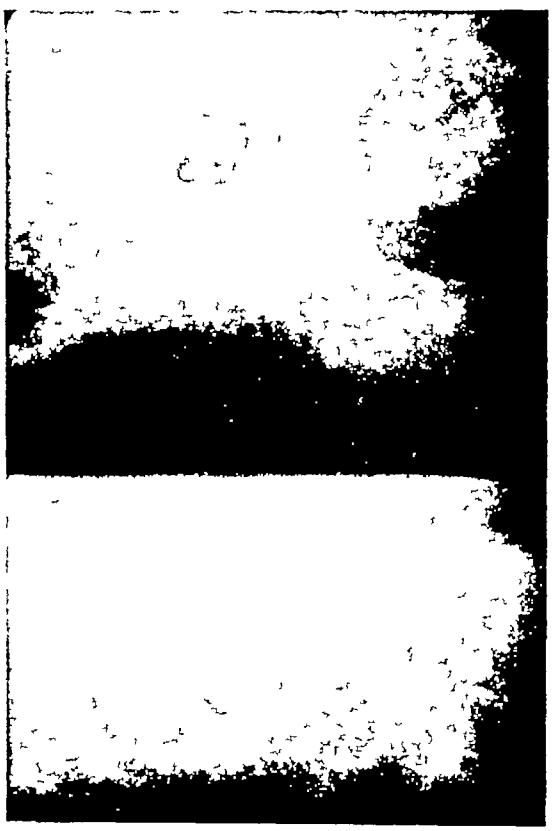

FIG 4 Flattening of the head, with destruction of the joint

On August 15, 1946, a primary joint debridement with denudation of all tuberculous tissue and joint cartilage of the head of the femur and the acetabulum was carried out on the left hip A Smith-Peterson nail fixation of the head into the acetabulum in a position of election was performed On February 6, 1947, the Smith-Peterson pin was removed, and there was a persistence of a sinus tract in the region of the left groin In spite of the apparent beginning arthrodesis of the articulation, the drainage continued On June 18, 1947, streptomycin was instituted utilizing 1/. Gm every three hours for a period of ten days After forty-eight hours drainage ceased

Positive sputum was first noted in July of 1945 and lasted until June of 1946 All smears of his hip drainage were negative However, the guinea-pig inoculation was positive in September, 1946, and

again on August 15 1946 The pathologist s report at that time (August 15 1946) was "amorphous calcific masses and necrotic bone no tubercles were seen" In December, 1946 left hip smear was positive for tuberculosis and also for Bacterium coli

Roentgenograms taken in June 1945 were reported as follows The findings of the hip are consistent with tuberculosis of long standing Those of the lungs are interpreted as far-advanced fibro-exudative type of pulmonary tuberculosis with a 2-cm cavity anteriorly in the right chest below the first rib In September, 1945 the pulmonary condition was described as more fibroid with the same cavity still present. In October 1945 films showed a progression of the left femur pathology of the previously described arthritis of the joint and increase in obliteration of the space with extensive decalcification of the femoral shaft It was felt that ankylosis was present roentgenologically The dorsolumbar spine was not remarkable for bone or joint pathology however there was an abnormal increase of the soft tissue density adjacent to the anterior margin of the fifth lumbar vertebra and first sacral segment.

By July 15 1946 the bone destruction had progressed so that films showed soft tissue calcification about the left hip joint and almost complete destruction of the articulating surfaces of both the acetabulum and the femur The leg appeared shortened by at least ½ inch Chest films were constant Postoperative films on August 19 1946 (Fig 5) revealed the shelf iliac graft held in place by a screw with a Smith Peterson nail stabilizing the hip Many bone chips were seen and much of previously described calcified tissue removed.

On November 19 1946 films revealed definite callus through the joint, also callus about the bony bridge. The fusion appeared to be solid particularly in the inferior part of the joint In January 1947 roentgenograms of the left hip exhibited solid bony ankylosis of the hip and the stabilizing bony bridge from the crest of the ilium There was no activity or bone destruction noted In chest films taken in May, 1947 there was considerable clearing of both lung fields, and marked improvement was the impression.

The patient was re-examined in November 1947 He is convalescing following a pulmonary lobectomy His general physical condition is excellent The left hip is stabile painless, and ankylosed in good position for function The area of sinus drainage appears normal.

FIG 5 Arthrodesis of the hip joint with shelf

Summary

The authors believe that the striking results obtained in the short period of time in these cases were directly attributable to the effects of streptomycin The clinical and roentgenographic fusion time which is usually from eight to ten months in the shoulder was reduced to three months, and in the case of the hip as soon as streptomycin was administered The multiple draining sinuses have completely disappeared Fusion was demonstrated on roentgenograms and clinically the shoulder and hip joint were solid painless and in excellent position

It was further believed on the other hand, that the patients would not have had the rapid recovery from streptomycin alone with conservative treatment if they had not had a complete joint toilet ' with an intra and extra-articular arthrodesis carried out.

INDUSTRIAL PSYCHIATRIC FELLOWSHIP

A pioneer program to train psychiatrists for the industrial relations and labor field will be inaugurated at Cornell University with an industrial psychiatry fellowship offered in the School of Industrial and Labor Relations. The Carnegie Corporation has made a supporting grant. The fellowship will be awarded to a physician with experience in psychiatry and will provide two years of training at the school. In addition to classroom study in basic industrial and labor relations courses the fellow will receive training in human relations work in a plant, labor union, or government office

A CLINICAL EVALUATION OF NEO-ANTERGAN AND ANTISTINE IN THE TREATMENT OF RAGWEED HAY FEVER

LOUIS LEVIN, M D , JOHN F KELLY, M D , and EMANUEL SCHWARTZ, M D ,
Brooklyn, New York

(From the Division of Allergy of the Department of Medicine of the Long Island College Hospital)

THE phenomenon of desensitization in anaphylaxis is defined as the refractory state produced by frequent small injections of a specific antigen From the beginning of the demonstration of specific desensitization in anaphylaxis and allergy, many workers began to turn their attention to a method which would inhibit anaphylaxis or allergy without the use of a specific antigen

According to the theory advanced by Sir Thomas Lewis and the work of Lewis and Grant and Lewis and Harmer, it is assumed that the physiologic response in anaphylaxis and in allergy is due to the union of antigen and antibody in the shock tissues, with the resulting liberation of a histamine-like substance, now regarded by most workers as being histamine itself [1-4] In 1910, Dale and Laidlaw described the close resemblance between histamine shock and anaphylactic shock in guinea pigs [5 6] More and more evidence has accumulated to support the histamine theory of allergic manifestations The writings of Dragstedt and Code lend emphasis to this theory [7 8] Although there is much evidence that histamine release constitutes a potent factor in the production of anaphylactic shock and allergy, there is justification for the assertion that not all manifestations can be explained on the basis of histamine activity This may help to explain, in part, the difficulty of obtaining a nonspecific agent that would act as a common denominator or common factor of all anaphylactic and/or allergic reactions This probably holds true for the newer antihistaminic drugs in which an attempt is made to counteract the effects of the histamine release that occurs from the union of an antigen and antibody Since there is evidence pointing to other factors as yet not entirely understood, not all allergies would be expected to respond to antihistaminic therapy alone However, any attack on the problem of allergy must be pursued to its fullest extent, and any point in the chain of events that occurs in an antibody and antigen reaction into which one can drive a wedge so as to secure even partial relief in a limited number of the allergic diseases should be fully utilized

Practically all the newer drugs that have shown any promise in the treatment of allergic diseases are the so-called antihistaminic agents that compete with the histamine, either by displacement or replacement of the attachment to the cell receptor A systematic search for clinically effective antihistaminic substances was only begun in 1937 French investigators, especially Fourneau and Bovet, experimented on animals with a number of highly potential antihistaminic chemical compounds [9] The most effective was 2-isopropyl-5-methylpenoxyethylamine (929F) Staub investigated another Fourneau compound, N-phenyl-ethyl-N-diethyl ethylynediamine (1571F) [10] Both were shown to alleviate anaphylactic shock and histamine-induced bronchoconstriction and to prevent histamine from contracting intestinal muscles These findings were confirmed by other workers The drawback to these two substances was that they were too toxic In 1943, Halpern described two new compounds [11] One of these was N-diethylamine-ethyl-N-benzyanaline, also known as 2339RP, and the other was Antergan Both compounds were investigated by many European workers These drugs were found to be more effective and less toxic than 929F and 1571F, but they still gave too many toxic reactions Mayer, Huttner, and Scholz investigated several aminopyridal and aminopicoline derivatives related to 1571F [12] They found that one of these, N-dimethylenediamine (pyribenzamine), was the most active antihistaminic and the least toxic An excellent discussion of this drug is contained in the work of Arbesman and his coworkers [13] Leibowitz and his coworkers compared its value in hay fever patients treated with and without specific pollen extract desensitization and also in those patients treated with specific pollen desensitization alone [14] Another comparatively new drug, β-dimethylamine ethyl benzhydryl ether hydrochloride (benadryl) was demonstrated by Loew and his associates to be an efficient antihistaminic of fairly low toxicity [15 16] Reports by Feinberg, Curtis and Owen, O'Leary and Farber, Schwartz and Levin, and numerous other workers showed good results [17-20] Of all of the compounds mentioned above, the more recent ones, pyribenzamine and benadryl, seemed to be the most effective and had the least toxicity However, there were still numerous side reactions encountered with these drugs,

Neo-Antergan was furnished through the courtesy of Merck & Co. Inc Antistine was furnished through the courtesy of Ciba Pharmaceutical Products, Inc

and the search is still on for better antihistaminic drugs with, what is very important, less toxicity

Bovet and his associates recently described a new drug, N P-methylbenzyl N-dimethyl aminoethyl and amidopyridine, or compound 2786RP (Neo-Antergan) [21] This drug was described as more potent and less toxic than Antergan A Swiss anti-allergic histamine antagonist, 2 phenyl benzylaminomethylimidazolene sulfate known as Antistine, is also one of the newer antihistaminic drugs available [22–24] The chemical formulas are as follows N-phenyl N benzyl aminoethyl-imidazolin, Antistine, and N *p*-methoxyl benzyl N - dimethyl aminoethyl aminopyridine Neo-Antergan

In an effort to determine whether these two drugs had greater efficiency and less toxicity and also to determine their value in comparison to the treatment by desensitization, they were selected in the treatment of one type of allergic phenomenon only, namely, the treatment of ragweed hay fever

Material

A series of 134 patients with ragweed hay fever was treated for the 1947 season The pollen count was not regarded as a factor in the evaluation of the symptoms of these cases since the pollen count, locality, and period of time of evaluation were constant for all cases Thus if at any particular time the pollen count was high this was constant for all cases and any difference in the over-all severity of the symptomatology of one group of cases as compared with the others could reasonably be attributed to factors other than the pollen count

The series was divided into three main groups. Group I received only the antihistaminic drugs. Group II received routine preseasonal and coseasonal desensitization with ragweed pollen extract, plus the antihistaminic drugs during the hay fever season and group III received the routine preseasonal and coseasonal treatment with ragweed pollen extract alone In order to eliminate any psychologic factors, group I which received only the antihistaminics, were also given preseasonal and coseasonal injections along with the others, except that the injections consisted of buffered saline, and group III whose treatment consisted of ragweed pollen injections alone, were also given pills during the hay fever season except that the pills were merely placeboes. So from the psychologic point of view all of the three groups received the same treatment injections, and pills

Since we were working with two drugs, groups I and II were further subdivided into group I A and I B and group II A and II B The A groups received Neo-Antergan, and the B groups received Antistine

The cases were chosen at random and placed in the various groups regardless of the routine classification of their skin sensitivities (A, B, or C) The Neo-Antergan was given in doses of 50 mg three times a day and the Antistine in doses of 100 mg three times a day, except in a number of cases where the side reactions made it necessary to cut the dose or, in some cases, to eliminate it entirely Also, some cases which could not tolerate Neo-Antergan were switched to Antistine and vice versa The symptomatic results and toxic reactions were tabulated The types of toxic reactions were also noted Those cases that were classified as obtaining relief had to show an appreciable amount of relief to be so considered The results are shown in Tables 1 to 3

TABLE 1.—RESULTS OF THE TREATMENT OF RAGWEED HAY FEVER PATIENTS WITH NEO-ANTERGAN AND ANTISTINE

	Number of Cases	Relief	No Relief	Percentage Relieved
Group I.—Without Ragweed Desensitization				
Neo-Antergan	27	19	8	70
Antistine	33	15	8	65
Total	50	34	16	67
Group II.—With Ragweed Desensitization				
Neo-Antergan	14	11	3	79
Antistine	20	15	5	75
Total	34	26	8	77
Group III.—Ragweed Desensitization Alone	50	38	12	76

TABLE 2.—TOXIC REACTIONS OF NEO-ANTERGAN AND ANTISTINE IN A GROUP OF HAY FEVER PATIENTS

	Number of Cases Treated	Number Experiencing Side Reactions	Percentage Experiencing Side Reactions
Neo-Antergan	41	15	36
Antistine	43	9	21
Total	84	24	29

TABLE 3.—TOXIC REACTIONS BY SYMPTOMS

Reaction	Neo-Antergan Group	Antistine Group
Sweating	2	0
Nausea	6	3
Dermatitis	11	0
Diarrhea	6	0
Colic	4	0
Dizziness	2	1
Tachycardia	2	2
Pruritis	2	1
Headache	2	1
Drowsiness	1	3
Nervousness	1	0
Pharyngitis	0	1
Vomiting	0	1
Constriction of chest	0	1
Gastritis	1	2

Each of the above 24 patients displaying toxic reactions had one or more of the above symptoms

At no time was there complete relief from either of the two drugs It was temporary, and very rarely was even this temporary relief complete. In about one third of the cases the relief

was intermittent, the patients obtained relief at one period of time and not at another with the same drug, or they might obtain relief at the beginning of the use of the drug and fail to do so later on The other two thirds of the cases obtaining relief did so with fairly regular consistency

Side reactions occurred with these two drugs also, although not with such a high incidence as was reported with some of the other antihistaminics Some of these toxic reactions were severe enough to warrant discontinuing the drug

Summary

A series of 134 patients with ragweed hay fever was divided into three groups One group was treated with antihistaminic drugs alone, the second group with the combination of antihistaminic drug and ragweed pollen desensitization, and the third group with ragweed pollen desensitization alone

Groups I and II were further subdivided into A and B, the A group receiving Neo-Antergan and the B group, Antistine In group I-A there was relief in 70 per cent of the cases and in group I-B there was relief in 65 per cent of the cases, an average of 67 per cent In group II-A there was relief in 79 per cent of the cases and in group II-B, relief in 75 per cent, an average of 77 per cent In group III there was relief in 76 per cent of the cases Toxic reactions occurred in 36 per cent of the cases being given Neo-Antergan and in 21 per cent of those taking Antistine

Conclusions

The two drugs, Neo-Antergan and Antistine, are of value in the treatment of hay fever Neo-Antergan seems to have more antihistaminic properties but at the same time gives more toxic reactions than Antistine

From the drugs alone, results were not as good as could be obtained with the combination of the drug and pollen desensitization There was, however, only a little better result from the use of the drugs and the pollen desensitization than from the use of pollen desensitization alone

Apparently, desensitization treatment is still the method of choice, and the antihistaminic drugs cannot be considered as substitutes However, the drugs are of value as adjuvants in that they help to relieve some of the more severe symptoms and to shorten their duration, even if only temporarily They help some patients who probably would not be relieved as well from desensitization alone We must also never lose sight of the fact that a considerable number of toxic reactions occur We feel that these antihistaminic drugs, if used judiciously, together with the recognized orthodox methods of treating allergic disorders, are of valuable assistance in the doctor's armamentarium

INTERNATIONAL CONFERENCE ON POLIOMYELITIS ANNOUNCED

The National Foundation for Infantile Paralysis of the United States has announced that it will celebrate its tenth anniversary by sponsoring the First International Poliomyelitis Conference, to coordinate and evaluate the last decade of progress that medical science has made in the study of the disease

According to the announcement, it will be the first time that information on poliomyelitis, its treatment and research, has been exchanged internationally on such an extensive basis It is expected that the conference will bring together the world's outstanding laboratory and clinical authorities on poliomyelitis The meeting will be held July 12 to 17, at the Waldorf-Astoria Hotel in New York City

STREPTOMYCIN IN CHRONIC TUBERCULOSIS

J N Hayes M D , F A C P and H Frazer Parry, M D , Saranac Lake, New York

STREPTOMYCIN has a definite bacteriostatic and some bactericidal action on tubercle bacilli in vitro and in vivo During treatment the number of bacilli in the sputum is usually reduced but in chronic tuberculosis only occasionally is the sputum converted to negative This refers to concentrated and cultural examinations Tubercle bacilli in vitro are inhibited by $^1/_2$ to 1 unit of streptomycin

The daily dosage and the optimal duration of treatment are not definitely established In most clinics in which 2 Gm a day were administered last winter, 1 Gm is now the daily dosage One-half gram may be sufficient The 1-Gm daily dose is usually given in two or three portions at eight- to twelve-hour intervals Acute toxic cases hematogenous, miliary or pneumonic have responded to a dosage of 2 Gm a day divided into from two to six doses and maintained for one hundred twenty days [1] The serum level with $^1/_2$ Gm twice a day is about 23 units at one hour after the injection and 4 units after twelve hours With a dosage of $^1/_2$ Gm every eight hours, the blood level is about 14 units at one hour and 5 5 units at eight hours after injection [2] The daily dose intrathecally in tuberculous meningitis is 50 mg or 1 mg per kg of body weight

It does not appear to be necessary to maintain a relatively even level of streptomycin in the blood We do not know how quickly a tubercle bacillus reproduces itself but probably one or two relatively high levels maintained in the blood for a short time during the day are sufficient to exercise a suppressive action on the tubercle bacillus or to interrupt the reproductive cycle of the organism

We do not know how long the treatment should be continued Everyone has observed that when symptoms are quite severe a rapid change for the better occurs within one week e g temperature falls to normal and cough and expectoration are reduced As a rule this is not due to action of streptomycin on secondary organisms The development of bacterial resistance to streptomycin is to some extent related to the duration of continuous treatment This refractoriness when it occurs usually develops at some time after four to six weeks of treatment There is a tendency therefore to reduce the length of a course to four to eight weeks It may even be possible that a course of one week a month continued throughout the year may be a good method in chronic pulmonary tuberculosis.

It is assumed that when the patient's bacilli become resistant to the action of 500 or 1 000 units of streptomycin no further benefit can be expected from continuation of treatment The bacilli which had become resistant may become sensitive again some months later This is rare in the experience of William Steenken [2] The sensitivity of the patient s bacilli should be examined at the end of each month s treatment.

Occasionally patients become allergic to some substance in the streptomycin mixture but this rarely interferes with continuance of treatment. With a daily dose of 1 Gm vertigo is much less common than with the 2-Gm dose. All the effects of a high dose are felt when the kidneys had been previously damaged and cannot excrete the antibiotic as rapidly as is usual This may happen with very little change in the urinalysis. It is necessary therefore to determine the blood level at about the third or fourth day and if it is abnormally high to study the renal function carefully In the Saranac Lake area we have been very fortunate in having the use of the facilities of the Trudeau Sanatorium Laboratory through the courtesy of William Steenken for the determination of blood levels and bacterial sensitivity

Streptomycin should not be used in competition with well-established and indicated treatment such as thoracoplasty and bed rest but it is recommended before and during resection of a lung or a lobe We do not recommend it before the average thoracoplasty operation

The best results of streptomycin treatment as had been forecast occur in the early exudative types of disease This may occur as a fresh and newly-discovered bronchopneumonia or miliary disease or it may manifest itself as a progression from a long-standing chronic disease. There is a large group of patients with chronic fibrosing disease usually with cavity formation. This report concerns some results observed in such patients who have been under streptomycin treatment since the drug first became available to us in November 1946 and whose treatment was terminated at least several months ago These patients were treated at Gabriels Sanatorium and in private sanatoria in Saranac Lake.

In choosing these 27 chronic cases we have excluded patients with chronic disease in whom a recent exacerbation was the indication for ad

Presented at the regional meeting, American College of Physicians Western New York Section Syracuse October 28, 1947

ministering the drug Some of these patients had tuberculous complications, and we were interested in the effect upon that disease and upon the pulmonary disease Many of them had intermittently progressive disease, some of which were very toxic

Of the 27 cases the disease was far advanced in 23 One patient with minimal fibrous disease had chronic bronchial tuberculosis Four patients had moderately advanced disease, one with tuberculous spondylitis, one with chronic tuberculous bronchitis, and one with tuberculous adenitis

The average duration of disease was nine years The disease had been discovered in one patient only one year previously, and ten patients had been sick for ten to twenty years

As to tuberculous complications, five had intestinal tuberculosis, seven laryngitis, five bronchitis, one chest wall sinus, one adenitis, two osseous tuberculosis, one fistula in ano, and one had nephritis

As to the dosage, three patients received 2 Gm a day throughout, 20 received 2 Gm at the beginning and later 1 or 1/2 Gm, and five received 1 Gm daily throughout the course The duration of treatment, especially in our earlier experience, was ten to twenty weeks, with a usual total dosage of 100 to 150 Gm More recently, we gave 42 Gm during six weeks A few of this group had more than one course of treatment

The immediate benefit, frequently in the first [illegible] of treatment, is sometimes very remarkable In this group of patients, the following changes were noted within the first few weeks one, disappearance of dysphagia, one, decreased or absent diarrhea, five, decreased cough and expectoration, two, loss of fever, one, sinus healed, one, fistula in ano healed, three, disappearance of wheezing, two, disappearance of bone pain, one, glands smaller, and two, worse These improvements were the more notable because of the prolonged duration of some of these symptoms

The later results up to date are much less impressive as a whole, but in some individual cases the improvement had been maintained satisfactorily Six patients died In two the bronchial disease healed with some residual stenosis Improvement in the laryngitis was maintained in two patients Of the three cavities which closed, one was kept collapsed with pneumothorax, and one cavity reopened In addition to the six patients who died, 14 more showed no permanent improvement We saw no definite benefit which could be attributed to streptomycin in the three cases of osseous tuberculosis

One of the most impressive effects of streptomycin therapy is reduction in the amount of sputum The decrease was quite definite in ten patients It was surprising to find that the sputum became converted in seven cases, but special features of the disease had some influence In chronic fibroid cavernous disease, intermittently negative sputa are not uncommon In one patient the pulmonary disease was inactive, and the tubercle bacilli had their source from the bronchial disease which was healed by streptomycin

The bacilli of one patient were resistant to 1,000 units of streptomycin before beginning the treatment She obtained no benefit In 12 patients the bacillary sensitivity was preserved In eight patients the bacilli became resistant and were not affected when grown in a medium containing 5 to 1,000 units of streptomycin

Case Reports

Case 1 —An unmarried woman, 29 years old, of Ecuador, came to Saranac Lake in October, 1945 Her pulmonary tuberculosis began in 1939, and she had never taken proper treatment She was thin and weak but without fever She had x-ray evidence of ileocecal tuberculosis Her x-ray showed disease scattered throughout both lungs, more intense in the upper thirds where there was marked fibrosis with cavity formation, and emphysema Slight increases of disease occurred early in 1946 A planigram revealed bronchiectasis, bleb formation, and small cavities in each upper third There was slight improvement up to February, 1947 The sputum was scanty and contained few bacilli The morning cough was prolonged and hard

Streptomycin was begun February 20, 1947, 2 Gm a day in 5 doses for eight days The temperature, which had been normal, rose to 99 6 F, and she developed a slight rash on the back of the hands The dose was reduced to 1 Gm, and a new lot was given The temperature then fell One gram in three doses was given until May 18, a total of 102 Gm in twelve and a half weeks Vertigo became marked after the third week and was slowly compensated for some months after stopping the drug She had a remarkable reduction in the harassing morning cough From March to July, she had two positive concentrated examinations, one of which was negative on culture, and six negative concentrates, of which two were negative on culture X-ray showed very little change for the better

Case 2 —The history of one patient is interesting from the point of view of the difficulty in making a diagnosis if one does not have tuberculosis in mind when the patient has a chronic respiratory condition A 35-year-old woman had a cough for ten years Five years ago, an x-ray revealed a minimal lesion in the right upper lobe which had the appearance of a well-fibrosed, healed lesion I doubt if tubercle bacilli were searched for, at least not re-

peatedly For nine years she had a recurring and later persistent wheeze in the right chest After a lipiodol examination a diagnosis of bronchiectasis was made. She had a number of respiratory infections, some of which were considered to be bronchopneumonia.

Finally, she was sent to Dr Clerf of Philadelphia, in the summer of 1946 and he diagnosed tuberculous bronchitis right upper proved by biopsy When she did not improve with rest treatment she was given streptomycin from February 24 to May 14 1947 2 Gm in 5 doses for one week and then 1 Gm in 3 doses for ten weeks. Also for six weeks she took 1.2 Gm. by aerosol inhalation divided into 4 doses a day The drug by inhalation was irritating and had to be stopped She had a total of 105 Gm. during eleven weeks The wheeze of nine years duration ceased entirely within six weeks it was decreased almost immediately The expectoration was reduced from 10 to 2 cc and became free of tubercle bacilli by concentrate and cultures. Bronchoscopy six weeks after treatment was begun showed healing of the ulcer and restoration of the mucous membrane to normal but the stenosis of the right upper bronchus changed from 4 mm to 7 mm. The well-fibrosed pulmonary lesion was unchanged

Conclusion

Streptomycin is not likely to lead to a complete cure of prolonged chronic pulmonary tuberculosis The more fibrocavernous the disease the less likely is benefit to be expected However, some of the extrapulmonary complications may be relieved or cured Occasionally such an improvement may occur especially in the better lung that the patient may be prepared for some form of collapse therapy In some patients a very satisfactory symptomatic relief may be anticipated and this may continue for at least six months after cessation of antibiotic therapy In a rare case perhaps when bronchial tuberculosis is the most active factor in the disease, a complete cure may occur

LIVING COSTS RISE FASTER THAN PHYSICIANS FEES

The cost of living has risen more rapidly than the fees charged by physicians for medical services according to Frank G Dickinson Ph D director of the Bureau of Medical Economic Research of the American Medical Association. In his new study entitled Comparative Increases in the Costs of Medical Care and the Costs of Living,' Dr Dickinson stated that the quantity of medical care received by the American people was at least two thirds more in 1946 than in 1939

'When the various indexes and ratios are studied, Dr Dickinson said, "it can be seen that the quantity of medical care received by the American people probably has increased much faster than the increase in the number of physicians. This apparent output per physicians doubtless reflects the increasing use of technical assistants.

'Whether one examines the record of total expenditures of the American people for medical care or the prices of significant items during recent years he comes to the general conclusion that the American people have been fortunate in that the costs of keeping well have not risen as rapidly as the cost of living.

Dr Dickinson estimated that the quantity of physicians' services—one of the medical care items—was approximately one-half greater in 1946 than in the base period 1935–1939 but the number of physicians was only one-seventh greater

Dr Dickinson's newest study is the second made within a year In 1947, he published a study entitled Is Medical Care Expensive? Dr Dickinson said that medical care items as a whole cost the American people $5 600,000,000 in 1946 but that only 3.9 per cent of the total personal consumer expenditures of the American people were spent for these medical care items. This compared with 4.3 per cent in 1940

He also found in his first study that in 1946 physicians received only 26 per cent of all the dollars spent for medical care as compared with 31 per cent in the base period 1935–1939 and 32 per cent in 1929 the first year for which the data were gathered and published by the U.S Department of Commerce.

On the other hand, he found that the amount spent for drugs in 1946 had risen to 24 per cent of all dollars spent for medical care as compared with only 21 per cent in the base period, 1935–1939 20 per cent in 1929

GANGRENE OF BOTH LEGS FOLLOWING FEMORAL VEIN LIGATION

JACOB SARNOFF, M D , Brooklyn, New York

CERTAIN therapeutic agents or procedures are so positive in their action that when first presented they are accepted without question This applies to such drugs as salvarsan, insulin, sulfonamides, penicillin, thiouracil, and likewise to surgical procedures which have been made possible of late because of the improvement in pre- and postoperative care, aided by antibiotics, blood transfusions, and especially the more modern methods of anesthesia, as applied to thoracic surgery

One of the operative procedures which has become very popular in a short time is that of femoral vein ligation This applies especially to the prevention and treatment of embolic processes that may occur in coronary disease, thrombophlebitis, or phlebothrombosis Femoral vein ligation for the above conditions is being abandoned by some of those who were former enthusiasts Femoral vein interruption is now accepted as being of therapeutic value in chronic, progressive arterial occlusion in conditions such as Raynaud's disease, arteriosclerosis, etc The physiologic mechanism of the circulation lends support to such a procedure The blood pressure in the large arteries drops to 32 mm of mercury in the arteriolar bed and to approximately 22 mm in the arterial capillaries, and 12 mm in the venous capillaries The venous return to the heart is aided by this vis a tergo, by the action of the muscular contraction, and by the suction created by the negative pressure of the chest during inspiration which helps to draw the venous blood from the vena cava into the right auricle

When obstruction to the arterial flow takes place, such as in chronic occlusive arterial disease, the capillary pressure is decreased until it is almost nil Gangrene may be threatening unless collateral arterial circulation is established Ligation of the femoral vein encourages the development of such collateral circulation When the femoral vein is ligated, there develops an increased resistance to the arterial flow, which in turn increases the pressure on the arterial side, causing a dilatation of the collateral arteries which attempt to re-establish the arterial blood supply For that reason it is now an established procedure to ligate the superficial femoral vein in cases of threatening gangrene of the lower extremity The results justify this procedure

We come now to a condition in which femoral vein ligation is used extensively as a prophylactic and curative measure in the occurrence of pulmonary emboli This procedure has been practiced in some of the recognized clinics throughout the country Some of the enthusiasts have not only advocated and practiced femoral vein interruption in cases of pathology of the circulation of the leg but also as a prophylactic measure preoperatively in abdominal surgery The object of such interruption is to prevent the possibility of emboli from the femoral vein and its tributaries from reaching the pulmonary circulation, producing infarcts and even sudden death from a pulmonary embolism This would appear to be a logical procedure when there is an existing pathology in these veins When no such pathology exists or none is threatened, this operation puts an additional burden on the patient in whom the chances of such an incident are so slight

One may argue, and rightly so, that this is a minor procedure if it be performed by the most competent hands, but that is not always the case Although the analogy is not complete, we may compare it to gallbladder surgery We know of cases where the surgeon, in the dilemma of bleeding from the cystic artery during cholecystectomy, hastily clamps the artery and includes the common duct in the clamp, resulting in biliary obstruction and its dire consequences In the case to be presented, such difficulty was apparently encountered, since the operation lasted an hour, which seems to suggest such a complication

It is now accepted that the p[illegible]site for such ligation, whether it be for cases of arterial occlusion or a prophylaxis against pulmonary embolism, is the femoral vein just below its junction with the profunda femoris The reasons for this location are twofold Ligation above this level is technically more difficult, and may also cause greater disturbance in the form of swelling, discomfort, and discoloration of the leg Yet, even at this level, complicating hemorrhage and even gangrene of the leg may follow the procedure in unskilled hands

The following case prompted the writer to present this discussion

Case Report

A man of 50 suffered from a heart attack in December, 1946, for which he was hospitalized for four weeks When he was almost well enough to go home, he had a chill lasting a few minutes He remained in the hospital and had another chill the following day

To avoid the possibility of emboli, the attending physician advised ligation of both femoral veins, which was done the following day Immediately after the ligation, both legs became cyanotic, and in

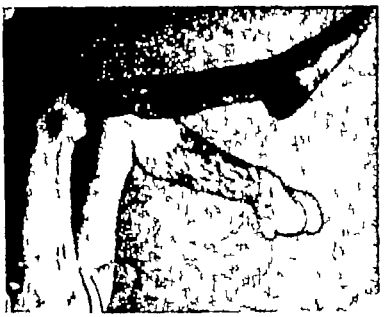

FIG 1 Gangrene of right leg with the loss of left foot and necrosis of soft parts of lower two thirds of leg. In spite of the extreme gangrene, patient was able to move freely even the right leg, since the gangrene stopped short below the insertion of the flexor and extensor muscles of the leg

the course of the next few days the patient developed gangrene of both legs.

The patient received a number of paravertebral nerve blocks in the hope of relieving the spasm of the arteries and thereby helping to establish collateral circulation but to no avail. In spite of the complete gangrene of the right leg and the loss of the left foot with the extrusion of the entire os calcis the patient continued to be treated first in the hospital from January to March and then at home from March to the end of October by means of local applications and internal medication It was only after a great deal of urging by the family and the patient that the doctor in charge yielded to surgical intervention

The patient was first seen by me on October 20 1947 One has to see the condition of the gangrene (Fig. 1) to realize the futility of such procrastination One must speculate as to the cause of the gangrene We may suspect that the gangrene followed the inadvertent ligation of more than the femoral vein It is conceded that ligation of the femoral vein alone should not cause such gangrene The incident is even more striking when both legs were affected. One may not see in a lifetime such an extreme case of gangrene lasting for a period of nine months without surgical relief nor can one appreciate the description of the condition without seeing a record which was taken in the form of photographs and motion pictures

In spite of his prolonged suffering and the gangrenous condition of his legs the patient exhibited great fortitude. He freely moved the right leg which was gangrenous up to two inches below the knee and the left leg from which the os calcis was protruding It was because of the high attachment of the flexor and extensor muscles of the leg, such as the biceps semimembranosus, semitendinosus and the quadriceps extensor through its ligamentum patella, that the patient was able to flex and extend freely the right leg in spite of such high and complete gangrene The appearance of such a condition was shocking

The patient pleaded with me to save every vestige of the living upper part of the right leg. He was fully aware of his condition and figured out for himself the advantages of saving the function of the knee He persisted in spite of the fact that I told him that it might be more advisable to amputate at the knee He would not consent to the operation unless I promised to save the stump below the knee which I did

Preparatory to the amputation of both legs the thickly coated encrustations and debris of the left leg were removed and the underlying surface thoroughly cleansed The encrustation extended to the upper third of the leg. Most of the underlying surface was covered with a new epithelial lining Approximately one third of the surface was covered with granulation tissue which might heal over or might require skin grafting at a later date

Under spinal anesthesia the soft tissues of the right leg below the knee were cut across at the line of demarcation and retracted as high up as possible. The tibia and fibula were sawed across at as high a level as possible, leaving about an inch and a half of the tibia to conserve the insertion of the ligamentum patella in front and the hamstring muscles behind The head of the fibula was then removed so as to avoid its protrusion at the stump The popliteal artery was found patent but not bleeding The popliteal nerve was pulled down about two inches and cut high up to avoid a painful stump The sutures were passed through the end of the ligamentum patella and the posterior ligaments of the knee and fascia to cover the stump The skin and fascia were approximated with interrupted figure 8 silk sutures. One Penrose drain was introduced underneath the fascia across the length of the stump The soft tissues were approximated without tension. The knee-cap appeared to serve as a rounded stump for the thigh The left leg was amputated about two inches above the ankle joint so as to allow enough soft tissue to cover the stump (Fig 2)

Because of the poor vitality of the remaining portion of the left leg, there appeared to be no chance for healing or recovering the use of that part of the

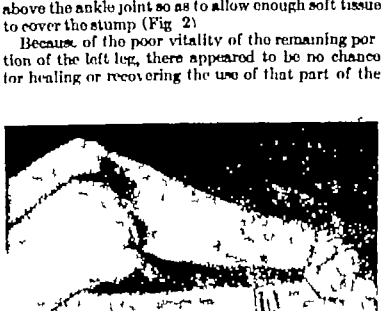

FIG 2 Condition after amputation of right leg below the knee and the left leg just above the ankle.

leg Amputation was decided on and was performed at three inches below the knee on December 7, 1947 Following this amputation, the stump healed well

Because of the prolonged disability, there was a marked flexion contraction of the left knee X-ray shortly after this amputation showed a rarefaction of the tibial stump at the junction of the epiphysis and diphysis and a bowing, not unlike a greenstick fracture, at that point

It was deemed advisable to institute proper rehabilitation to relieve the contracture and to fit him with artificial legs He received this treatment at the New York University-Bellevue Medical Center, Institute of Rehabilitation and Physical Medicine, with gratifying results His morale has been raised to a high standard, and he is now self-sufficient in attending to his regular duties and able to walk about without any aid

In discussing this case with some of my colleagues they called to my attention two cases of venous ligation of the lower extremities performed during the last few months in local hospitals, which were followed by gangrene of the leg Amputation had to be performed in both cases, and one resulted in a fatality The occurrence of such mishaps would tend to show that femoral vein ligation is not to be considered too lightly

This case is reported in detail to illustrate what may happen following femoral vein ligation under unfavorable circumstances It serves to emphasize the need for caution in the selection and the performance of femoral vein ligation

1406 Albemarle Road

SURGICAL INSURANCE STATISTICS

Boys incur 15 per cent more surgical operations than girls, with 60 per cent of all children's operations being tonsillectomies and 20 per cent appendectomies or fractures, according to an analysis of 00,000 surgical benefit claims of all ages made by a committee of the Actuarial Society of America and presented at the annual meeting of the Society in New York. This was one of a long list of findings from the study, which covered group surgical insurance claims reported by companies doing 70 per cent of this type of insurance and covering a period of eight months of last year

Group surgical insurance, first written in 1938, has become an important segment of the insurance business, covering 10,000,000 persons, the report stated This insurance, added to protection on an additional 10,000,000 covered by Blue Cross, individual contracts or other plans, gives a total of over 20,000,000 persons now protected by surgical benefit insurance

Eight types of operations were found to account for the greater part of all surgical benefit claims tonsillectomy, appendectomy, benign tumor or cyst, hemorrhoidectomy, fracture, hysterectomy, herniotomy, and dilation or curettage. These accounted for 60 per cent of all claims, 57 per cent of the male cases and 67 per cent of the female cases

Multiple operations take place in a large number of cases, taking advantage of the urgency of the major cause In 17 per cent of all cases, more than one operation was performed under the one procedure, in the case of claims for wives, 31 per cent were multiple, for female employes, 24 per cent, for male employes 15 per cent, and for children 5 per cent In gynecologic surgery, a maximum of 51 per cent was shown On the average, multiple operation claims were for amounts almost double those for single operations.

More complicated surgery was incurred at ages over 50 in the case of men For women, the operations were generally more serious than for men at all ages, but the severity changed little with age, except for a slight peak in late childbearing or post childbearing years

Not all surgery is performed in hospitals, the report shows, though most of it is Men show a higher out-of-hospital surgery incidence than women In the case of men, 23 per cent of the operations were performed out of hospitals, for children, 16 per cent, and for women, 11 per cent The average amount paid for out-of-hospital claims was less than one third that for hospital surgery

Taking appendectomy as an example, it was found that 30 per cent of the doctors charged not over $100, 50 per cent not over $125, 80 per cent not over $150, and 90 per cent not over $165 The analysis was said by the committee to indicate that charges were usually higher for male employes than for women, reflecting the general practice of suiting fees to the ability to pay

Analysis of surgical fees in the cases covered showed that charges were highest on the west coast, with California showing the highest cost of any state In California the charges were 39 per cent greater than the U S average in nonobstetrical cases and 61 per cent over average in obstetrical in the middle Atlantic states, next highest, the charges were 3 per cent and 5 per cent higher than average, respectively

The south Atlantic states showed the lowest cost, 12 per cent and 9 per cent respectively, below average The average surgical claim for male employes was $48, for female employes $63, for wives $71, for male children $34, and for female children $37

THE TREATMENT OF VENOUS THROMBO EMBOLISM

STUART W COSGRIFF, M D , RICHARD J CROSS M D and DAVID V HABIF, M D
New York City

(From the Departments of Medicine and Surgery Columbia University College of Physicians and Surgeons and the Presbyterian Hospital)

THIS PAPER is a report of the method employed and the results obtained in the treatment of 160 cases of venous thrombo-embolism at the Columbia Presbyterian Medical Center during the past one and one-half years A medical-surgical team was organized to manage therapy and all patients in this series drawn from all services in the Center, were seen daily by at least one of the members of this group Anticoagulants were used except when contraindicated or when bleeding resulted from their use, and in such instances vein ligation was performed

The rationale for the use of anticoagulant therapy is based on the experimental and clinical evidence that a thrombus in a vein incites an inflammatory reaction leading to fixation of the clot within three to five days Adequate anticoagulant therapy prevents propagation during this period of fixation and during the transition from bed rest to full activity It is understandable therefore, that even with anticoagulant therapy a patient may sustain a pulmonary embolus in the first few days of treatment, since the entire thrombus may not be completely fixed at that time.

Program of Management

In this study heparin was generally used during the first thirty-six to forty-eight hours in order to obtain an immediate anticoagulant effect Subsequently, during the course of dicumarol therapy, heparin was used whenever the prothrombin time fell below satisfactory levels The sodium salt of heparin was administered by intermittent subcutaneous injections The dosage schedule was as follows one hour after an initial intravenous injection of 25 mg 50 mg were given in the deep subcutaneous tissues and beginning three hours later, 30 mg subcutaneously repeated every three hours. It was felt that a persistent elevation of the clotting time was desirable, and accordingly the heparin dose was adjusted to maintain a venous clotting time between twenty and forty minutes, determined by a modified Lee-White method. Bleeding secondary to heparin therapy occurred in only one patient Provided that the injections were given in the deep subcutaneous tissues, significant discomfort was seldom produced and there were only rare small ecchymoses at the injection site. It was found that this subcutaneous method usually eliminated the marked fluctuations of venous clotting time encountered with intermittent intravenous injections and allowed for a sustained effect. A method is being studied at present for administering the sodium salt of heparin by intermittent subcutaneous injection without control of clotting times, but the results to date have not been evaluated

Dicumarol the principal drug, was started on the first day and continued throughout the entire period of treatment Following an initial dose of 200 to 300 mg by mouth the first day, 100 to 200 mg were given on the second day, and thereafter daily doses varied between 0 and 300 mg Variable absorption was noted with administration by rectum although in a few cases the response was satisfactory Daily prothrombin times were determined on whole plasma by a modified Quick method Normal 100 per cent activity was fourteen (plus or minus two) seconds with a desired effective anticoagulant range of twenty two to forty-four seconds, corresponding to 30 and 10 per cent of prothrombin activity, respectively It is believed that this range provides for the prevention of further thrombus propagation and yet reduces hemorrhagic complications to a minimum As noted previously, supplementary heparin was given whenever the prothrombin time fell below twenty-two seconds Excessive hypoprothrombinemia was treated promptly by the administration of synthetic vitamin K in the form of 72 mg of menadione bisulfite given intravenously This usually resulted in a reduction of the prothrombin time to safe range within twelve to forty-eight hours In addition, when bleeding occurred 500 cc of whole blood or lyophilized plasma was given to produce an immediate return of the prothrombin time to a safe range. While this amount of plasma resulted in an immediate reduction of prothrombin time the effect was maintained for only six to ten hours For this reason it was at times necessary to give 500 cc of plasma every six to ten hours until the more permanent effect of the menadione was manifest The prothrombin time of reconstituted lyophilized plasma which contains 0 1 per cent citric acid was determined to be consistently normal

It was observed that 20 per cent of those indi

Presented at the 23rd Clinical Congress of the American College of Surgeons, New York City September 8, 1947

viduals receiving dicumarol were hyperreactors to the usual dose of dicumarol, and in these patients significantly lower dosage was necessary This group included chiefly the elderly, debilitated, and undernourished, as well as those with hepatic disease and patients in the immediate postoperative period Minor bleeding occurred in eight cases (5 2 per cent) and major bleeding in two cases (1 3 per cent) There were no fatalities from hemorrhage Patients with a history of previous thrombo-embolism are known to have a higher percentage chance of recurrence following operation or childbirth Individuals in this group have been given dicumarol without preliminary heparinization as a prophylactic measure Some cardiacs and patients with extensive varicosities or malignancy, although without a thromboembolic history, have also received dicumarol postoperatively for prophylactic reasons

As far as the general program of management was concerned, all patients were maintained on complete bed rest with legs elevated during the first six days of anticoagulant administration Undue strain and exertion were strictly avoided If by the sixth day the clinical picture was satisfactory as regards general condition and pulmonary and extremity status, the patient was allowed up and encouraged to walk rather than sit in a chair Anticoagulant therapy was continued until the patient was completely ambulatory, generally another four to six days Penicillin was administered prophylactically to most patients with pulmonary infarction

Results

As shown in the accompanying table, in 60 patients with deep venous thrombosis treated with anticoagulant therapy, subsequent thrombosis took place in three cases (5 per cent) after the cessation of therapy One nonfatal pulmonary embolus occurred on the third day after the start of treatment (1 7 per cent) There were no fatal emboli in this group

In 80 patients with pulmonary embolus as the presenting problem, with or without clinically recognizable deep venous thrombosis, there were three (3 8 per cent) subsequent nonfatal pulmonary emboli, two (2 5 per cent) subsequent venous thromboses, and one (1 3 per cent) subsequent fatal embolus This fatality occurred ten minutes after the first 25-mg intravenous dose of heparin The three subsequent nonfatal pulmonary emboli occurred prior to the sixth day of therapy

In 20 patients with a history of previous thrombo-embolism treated postoperatively or postpartum prophylactically with dicumarol alone, there were no subsequent venous thromboses or emboli

Bilateral ligation of the superficial femoral vein has been carried out during this period in seven patients in whom anticoagulant therapy was considered to be contraindicated or in whom bleeding had resulted from its use Two of these seven patients had a prophylactic ligation of the superficial femoral veins because of a history of previous deep thrombosis In one of these, a nonfatal pulmonary embolus occurred four days following ligation, or two days after a common duct exploration This patient was subsequently treated with anticoagulants and did well

Paravertebral sympathetic blocks have been performed with satisfactory results on ten patients who have shown marked edema, severe pain, or vasospasm

Follow-up data are as yet too brief and incomplete to be significant, but, in general, where the process has been confined to the calf, there have been no postphlebitic symptoms or signs Those patients with ileofemoral thrombophlebitis have had mild to moderate edema for about three to four months

TABLE 1.—Results of Anticoagulant Therapy in 160 Patients with Venous Thrombo-embolic Disease

Type of Case	Number of Cases	Subsequent Thrombosis	Subsequent Embolism	Fatalities
Venous thrombosis	60	3 (5%)	1 (1 7%)	0
Pulmonary embolism	80	2 (2 5%)	3 (3 8%)	1 (1 3%)*
Prophylactic with history of previous thrombo-embolism	20	0	0	0

* The fatality occurred from a massive pulmonary embolus ten minutes after the start of therapy in the form of 25 mg heparin intravenously

Summary

1 The management of thrombo-embolism and the results obtained in 160 cases have been reviewed

2 A method for the administration of the sodium salt of heparin by intermittent deep subcutaneous injection was described

3 Lyophilized plasma has proved satisfactory for the immediate reduction to a safe range of an excessively high prothrombin time associated with bleeding

4 Anticoagulant therapy has proved to be an effective method for the treatment of thrombo-embolism

A portion of the heparin used in this study was supplied through the courtesy of Roche Organon, Inc. Nutley New Jersey

A portion of the dicumarol was supplied through the courtesy of E. R. Squibb & Sons New York City

WHAT IS NORMAL BLOOD PRESSURE?

HENRY I RUSSEK M D , F A C P , Staten Island, New York

(From the U.S Marine Hospital Staten Island)

FEW FUNCTIONS of the body have been so extensively studied as human blood pressure Nevertheless, a wide divergence of authoritative opinion still exists as to the range of this important physiologic measurement More than a generation ago clinicians accepted as normal an appreciable increment in the systolic blood pressure with advancing years Thus, the formula "100 plus the age ' was in common usage in that early period of *clinical sphygmomanometry* Within the last twenty five years, however, the highest acceptable reading of the systolic blood pressure has been persistently lowered so that today 140 mm is generally regarded as the ceiling level irrespective of age [1-5] According to this view a reading above 140 mm is just as abnormal in an old man as in a young one [3] Indeed it has even been claimed that normal blood pressure remains constant throughout life that it never exceeds 120 mm and that levels above this limit at any age are in the zone of hypertension [6]

Conflicting with the concept that normal blood pressure is little altered by age are the observations reported by others [7-11] An analysis of 1,000 elderly seamen for example, disclosed that 87 per cent had systolic blood pressures above 120 mm., and 64 per cent had levels above 140 mm [9] With the former limit, therefore only 13 per cent of the series would have qualified as normal and with the latter only 36 per cent Normal blood pressure so defined presents the paradox of being increasingly uncommon with advancing age If these standards are to be upheld it must be concluded that hypertension is the usual finding after middle age and that abnormal elevation of the blood pressure is generally compatible with longevity Numerous statistical surveys however, fail to support the latter conclusion

On the other hand, an appreciable percentage of elderly persons manifests elevated systolic blood pressure with normal or low diastolic blood pressure, for example, 170/70 These persons, unlike those with diastolic hypertension, generally have no significant abnormalities of the cardiovascular system The frequency of this type of systolic hypertension increases appreciably with age (Fig 1), having been noted in more than one third of the male subjects over 60 in one series.[11] Such elevation of the systolic blood pressure has been attributed to diminution in the elasticity of the aorta and its large branches. That the elasticity of arteries diminishes progressively with advancing years, becoming particularly marked with the fifth decade, has already been established [12] Experimental studies also lend support to the view that decreased arterial elasticity causes a rise in the systolic and a fall in the diastolic level [13] A similar trend with age has actually been noted clinically in normal blood pressure levels [9-11] It appears likely therefore that loss of arterial elastic tissue as well as *systolic hypertension to which it frequently gives* rise are comparable to such physiologic changes as occur in the hair, skin, skeleton, and other structures with advancing years Statistical studies dealing with life expectancy in elderly persons with systolic hypertension are conspicuously lacking Unfounded conclusions have been drawn concerning this group because of failure to separate them from persons with diastolic hypertension and because of inferences based on findings in younger age groups

Age however, does not exert its influence upon blood pressure solely through involutionary vascular changes. A neurogenic factor in addition to the vascular one is also operative [11] By means of the cold pressor test it has been shown that the response of the blood pressure to a standard stimulus increases progressively as persons grow older [14 15] This effect appears to result from increasing sensitivity of the vasomotor centers with age Since the act of measuring the blood pressure is also a relatively standard stimulus (psychic

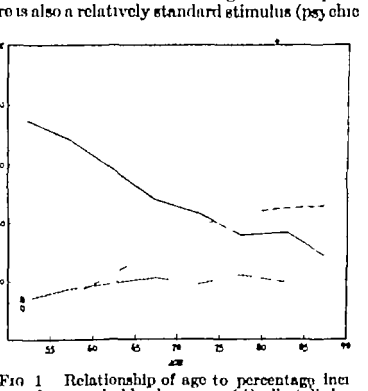

FIG 1 Relationship of age to percentage incidence of normal blood pressure (*A*) diastolic hypertension (*B*) and systolic hypertension (*C*)

in nature), progressively higher levels of normal blood pressure are to be expected from this influence with advancing years Thus, the neurogenic factor tends to elevate both the systolic and diastolic pressures, while the vascular factor tends to increase only the systolic level while simultaneously depressing the diastolic The combined effect of these influences is a marked augmentation of the systolic reading with but little change in the diastolic reading with age

These considerations demand that normal standards allow a progressively increasing range in the systolic blood pressure while permitting but little variation in the diastolic level with succeeding decades The significance of the systolic reading should, therefore, be de-emphasized in the latter decades of life, since it is the diastolic level alone which can establish the existence of hypertensive disease The formula "100 plus the age," formerly employed as an index of normal blood pressure, seems to reflect fairly accurately the tendency of normal systolic blood pressure to increase with age

Published reports dealing with younger groups indicate that normal diastolic blood pressure probably never exceeds 90 mm [16–18] Certainly no higher limit would seem acceptable after middle age

The current standards of normal blood pressure and attitude toward the hypertensive patient are resulting in immeasurable harm both through improper diagnosis and overemphasis upon a disease which as yet has no effective therapy As matters now stand most patients probably ought never to be told that they are hypertensive

BATTLE ALCOHOLIC PROBLEM

A "hands across the continent venture" for battling the problems of alcohol will get started this summer when the Yale Institute of Alcohol Studies in the Southwest is established. The joint attack by Connecticut and Texas educational and scientific leaders was formally inaugurated at a two-day celebration at Fort Worth, Texas, May 14 and 15

Plans for the establishment by Yale University of a large, long-range research and clinical center in cooperation with Texas Christian University were announced by Dr Howard W Haggard, director of the Yale Laboratory of Applied Physiology

As now planned, the Yale Institute of Alcohol Studies in the Southwest will comprise the following activities

1 A research unit in the social sciences at Texas Christian University

2 A clinic for the rehabilitation of alcoholics at Dallas

3 A summer School of Alcohol Studies at Trinity University, San Antonio This will be patterned after the nationally famous summer school conducted each year in New Haven by Yale

4. Informal educational activities, at all levels, throughout the state

The clinic in Dallas, Texas, under the direction of a psychiatrist who has specialized in the treatment of alcoholism, will conduct research on physiologic sensitivity to alcohol, psychologic factors contributing to alcoholism, preventive mental hygiene, and tests of new methods of treatments All work will be carried out in cooperation with medical institutions which will receive grants from the Yale Institute

The clinic will maintain inpatient and outpatient services, will accept referrals from all sources, and will offer its services particularly to the police courts in order to replace admittedly useless penal methods by clinical treatment It will seek to use all community resources in the care and treatment of alcoholics One of its most important functions will be the training of clinical personnel to meet the great demand for specialists

The research unit in the social sciences will consider methods of alcohol education in schools, investigation of social, economic, educational, and religious factors which may be used in the prevention of inebriety, determination of the extent and intensity and nature of alcoholism in Texas and the Southwest in various age groups, occupations, rural and urban areas, a survey of the effectiveness of liquor control laws

SURGICAL TREATMENT OF HYPERTENSION

DAVID P BOYD, M D , F R C S , Amsterdam, New York

DURING the past few years 28 persons have been subjected to varying degrees of sympathetic denervation in this city for the relief of essential hypertensions It is proper to remark that the early operations were made possible by the progressive scientific viewpoint of my surgical colleagues Dr Lew H Finch and Dr C A Spence and subsequently by the medical practitioners of this community

The commonly accepted indications and contraindications for sympathectomy were observed in those patients In particular it was felt that people with extensive renal damage were not candidates Furthermore, an attempt was made to evaluate the cardiac status accurately by physical examination, x ray studies and electrocardiography Advanced myocardial damage was considered to make the operation too hazardous Thus patients with known episodes of congestive failure in the past and those with excessive enlargement of the heart were, as a rule rejected On the other hand, several patients who stood the operation well and benefited from it have had one or more cerebrovascular accidents One case was a thirty two-year-old man who was operated upon still bearing the stigmata of his stroke, who has had a pressure of 150 to 160 systolic since his operation in 1944 and who works every day In other words, the operation may be offered to the younger group of hypertensives without severe myocardial or renal damage whose blood pressure can be shown to be labile and not fixed by the sedation tests

The majority of the patients were in the third or fourth decade, but two patients in their fifties were operated In these older cases the Max Peet operation was done that is a bilateral sympathectomy confined to the thoracic region resecting a liberal segment of the splanchnic nerves and the chain from eighth or ninth thoracic to the eleventh or twelfth thoracic. Some of the remaining cases were done by the Smithwick technic but the majority had the extremely radical combined thoracic and lumbar operation which is recommended by James L. Poppen [1] A 2-inch segment of the eighth and eleventh ribs was resected posterior to the angle and the sympathetic chain was removed from the fourth thoracic downward The entire greater and lesser splanchnic nerves were mobilized in continuity with the chain Below the twelfth rib the retroperitoneal area was entered and the first and second lumbar ganglia were mobilized and the splanchnics cut as they enter the celiac ganglion This exposure gives an opportunity for inspection of kidney and adrenal and biopsy if indicated, and it preserves the integrity of the diaphragm Thus radical operation appears to give better results as far as reduction in pressure is concerned and especially as regards persistent postural hypotension, but symptomatic relief was not influenced by the extent of the procedure

The hospital mortality was not excessive One patient died on the table at the completion of a first stage operation She was a twenty-eight year-old woman with malignant hypertension and a grave degree of cardiac impairment Another patient died of heart failure a week after a first stage procedure Both of these cases occurred early in my experience and represent serious errors in surgical judgment In addition to the latter, three patients are known to have succumbed to cardiovascular disease These three patients were advanced hypertensives but all were well enough to be working at the time of death

Of the 23 cases which remain four were lost to follow-up Of the 19 whose present status was known, ten had a substantial and persistent fall in blood pressure Of these ten at least three had a normal blood pressure and were symptom-free one for five years one for three years and one for one year after operation The average drop in blood pressure however, was 40 to 50 mm. systolic and 20 and 30 mm diastolic. The remaining patients had a pressure approximating their preoperative level One would estimate therefore that a worthwhile result may be had in about 50 per cent of the operative cases and that the mortality will be somewhere between 1 and 5 per cent, depending upon the selection of cases All workers in the field have been impressed with the striking symptomatic relief afforded by this operation with special reference to headache and dizziness. There was no case in this series in which symptomatic relief was not obtained, even when a modified operation was carried out

The complications were few despite inadvertent pneumothorax in about one-fifth of the cases No significant pleural effusion or empyema resulted No serious wound infections occurred although cotton was frequently used as suture material. The average hospital stay was three and one-half weeks The chief complication, from the patient's standpoint is wound pain. This has the features of an intercostal neuritis and

Presented at the Fourth District Branch of the Medical Society of the State of New York, October 23 1947

is presumed to be due either to traction on the rami communicantes when separating the ganglia or to trauma at the time of the rib resection This pain has been extremely troublesome and refractory to treatment However, it always subsides eventually as the traumatic intercostal neuritis heals

In conclusion, one might say that this operation has something worthwhile to offer to the severe hypertensive, especially those in the earlier decades It is to be considered, in the main, a palliative operation, and it carries a low mortality and morbidity One may anticipate relief from disabling symptoms and, indeed, achieve an occasional brilliant cure My results do not agree with those who feel that a high percentage of patients are markedly benefited However, it is conceded that with increasing experience improved results are being obtained There does not seem to be any doubt that it represents the most effective means at our disposal in dealing with a condition which, in its various forms, has become one of the leading causes of death in our generation

NEW DRUGS SAID TO LIMIT DEATHS OF HEART DISEASE

Deaths from coronary thrombosis—one of the most common and most serious forms of heart disease—can be cut from one third to one half with new blood-controlling drugs, a twenty-months' nationwide study showed in May

The investigation was sponsored by the American Heart Association with financial support of the United States Public Health Service It involved 1,000 patients in 17 United States hospitals

The drugs used principally are the anticoagulants dicumerol and heparin They tend to prevent blood from clotting Coronary thrombosis is formation of a blood clot in an artery leading directly to the heart If the clot becomes big enough to shut off all or most of the blood to the heart, the sufferer dies

Dr Irving S Wright, associate professor of clinical medicine at Cornell University, described the study in a paper for the Illinois State Medical Society

VA TO OFFER JOBS TO YOUNG DOCTORS

The Veterans Administration disclosed in April what it hopes will be a solution to a shortage of some 1,400 doctors which will face the VA between June 1 and August 1

The doctors who will depart are those who were trained free during the war under the Army and Navy special training programs and who will be completing their commitments to give service in exchange for education.

Dr Paul B Magnuson, VA Medical Chief, said recently that an appeal would be made to recruit doctors who are completing their resident requirements in hospitals, and who still must be two years in practice before full certification He said that there are now 6,000 such residents in training in private hospitals, and 2,000 in the 126 VA hospitals in the country "We will offer them full-time VA appointments in which they can work out their two years of practice," he said

He also said that a plan was being made to separate the outpatient departments of VA regional offices from the examination department, so as to leave the VA physicians free to conduct examinations for pensions, and have the outpatient treatments carried on by local doctors on a part-time basis

Dr Magnuson warned, however, that "a feeling of uncertainty as to the future of the VA medical program" since the personnel cuts under the blanket order of February 10 had been destroying morale in the service and retarding recruitment "While a cut-down of medical personnel had not been intended in the retrenchment order made necessary by reduced appropriations," he said, "such a cut-down nevertheless had taken place throughout the country "

THE ELECTROCARDIOGRAM IN CATATONIC SCHIZOPHRENIA

STEPHEN MAJOR M D Binghamton, New York

(From the Binghamton State Hospital)

UNTIL recently, electrocardiographic studies in mental disorders were few in number and were concerned mainly with cases of circulatory asthenia and anxiety states Most recent publications showed electrocardiographic abnormalities in a larger group of cases. However, only a few were schizophrenics, and no mention was made of the type of schizophrenia to which these patients belonged

This paper is concerned with the study of 52 young schizophrenics of the catatonic and hebephrenic type The great majority were of recent onset They were all psychotic when studied and all but a very few were either in a state of catatonic excitement or stupor That condition made the study particularly difficult and prolonged However only in four cases was it ultimately necessary to resort to intravenous barbiturate sedation

Thirty-six cases belonged to the catatonic type, 16 to the hebephrenic type with catatonic episodes Thirty five were women, 17 men Their ages ranged from fourteen to thirty five years 27 were in the age group of fourteen to twenty-six (ten of them in their teens), and 25 were between twenty-six and thirty five years of age The age was limited to thirty five years to make reasonably sure that no latent cases of coronary artery disease would be included in the study

In all the cases, clinical history and examination and radiologic study revealed no evidence of cardiac disease All the patients had the asthenic-athletic habitus

All the electrocardiograms were taken in recumbent position and at 10 mm. (1 millivolt) standardization Sixty-one electrocardiograms were studied, in eight cases, more than one electrocardiogram was available

Particular attention was given to the following data pulse rate duration of the P-R interval, the form, size, and direction of the P and T waves axis deviation, ST segment depression and arrhythmias, if considerable enough Those features which were omitted were done so because it was felt that they were not different from what is considered standard in young adults

The T waves were considered low when less than 1 mm (0 1 millivolt) in amplitude The ST segments were considered depressed when more than 1 mm below the isoelectric line (T P interval), and R_4 was considered short when less than 2 mm

The pulse rate was found to be below 70 in four cases and above 100 in six cases

The P R interval was between 0 07 and 0 11 in 24 cases, which means a 46 per cent incidence compared to 0 per cent in normal adults of the same age group A detailed list of P R intervals is given in Table 1 with comparative percentages in healthy young adults of the same age group obtained from the studies of Graybiel *et al* [1] No relationship could be found between the presence of short P R intervals and the pulse rates, and some of the shortest P R intervals occurred in cases with the slowest pulse rates (Figs 1 and 2)

TABLE I —DURATION OF THE P R INTERVAL IN 52 CASES

P R Interval in Seconds	Incidence*	Percentage	Normal Values Per Cent
0 07	1	1 6	
0 08	3	4 9	
0 09	3	4 9	
0 10	11 (2)	21 1	
0 11	6 (1)	11 3	
0 12	14 (4)	26 9	7 6
0 13	4	6 5	8 3
0 14	4 (1)	7 6	21 1
0 15	3	4 9	11 7
0 16	1 (1)	1 6	24 9
0 17	1	1 6	9 5
0 26	1	1 6	

* Numbers in parentheses indicate incidence in follow-up tracings.

The largest incidence of absent P waves was found in the chest lead and the same applies to the negative P waves The greatest number of diphasic P waves were found in lead III Abnormal P waves in the chest lead were found in 90.3 per cent of these cases as compared with the

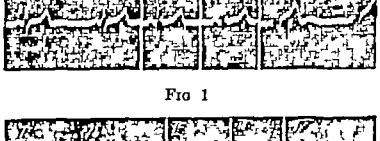

FIG 1

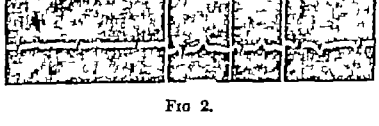

FIG 2.

Presented at the Interhospital Conference of the Mental Hygiene Department, Psychopathic Institute Syracuse April 3rd 1948.

TABLE 2 —P WAVES

	Absent	Diphasic	Negative
Lead I	0	0	1
Lead II	2	0	0
Lead III	1	9 (1)	3
Lead IV	7	5	35 (7)

41 per cent of abnormal P_4 in Graybiel's study (Table 2) [2]

The T wave abnormalities are given in Table 3 Abnormal T waves in lead III were found twice as many times as in Graybiel's study In the chest lead of healthy young adults Graybiel found only 0 2 per cent T wave abnormality (diphasic T waves), while in the present study negative T_4 was found in 25 1 per cent of the cases, and all the abnormalities in chest lead totaled 40 3 per cent

TABLE 3 —T WAVES

	Low	Diphasic	Negative
Lead I	6 (1)	0	2
Lead II	2	2	2
Lead III	8 (2)	7 (2)	12
Lead IV	5 (2)	3	13 (2)

The R waves in chest lead were small in ten cases and absent in one

Abnormal P, R, and T waves in chest lead, in combination of any two or all three in the same record, occurred in 22 cases or 42 3 per cent

ST segment depressions were found in eight cases (15 3 per cent) in lead II, and in seven cases (13 5 per cent) in lead III Normal incidence would be 0 and 0 6 per cent, respectively

Tendency to left axis deviation was found in five cases and tendency to right axis deviation in six cases Sinus arrhythmia occurred in four cases

Some electrocardiograms are presented for illustration Among them are the records of five of those cases in which more than one record was

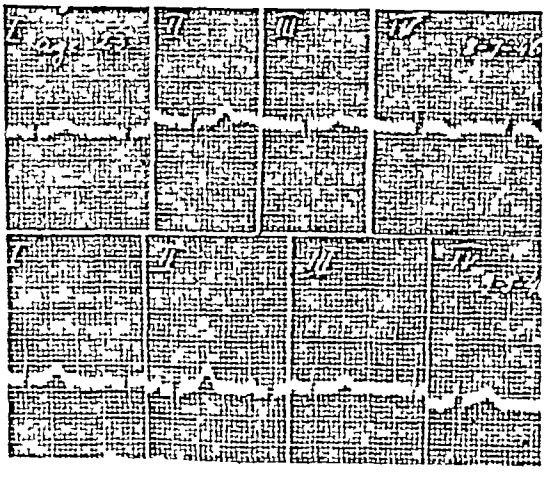

FIG 3

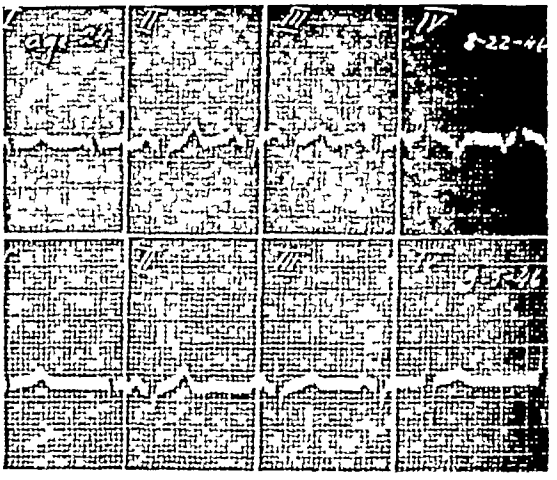

FIG 4

obtained Although this paper is not dealing with the relationship between clinical improvement and favorable electrocardiographic changes subsequent to therapy, it is interesting to mention that, in some cases (Figs 3, 4, 5), the second tracings show some favorable changes coincident with clinical improvement However, one case (Fig 6) showed no improvement in subsequent records, and the patient also failed to show any improvement from electric shock and insulin treatment

In the case of a young woman whose catatonic excitement was uninterrupted and in whom all treatments were ineffective, a prefrontal lobotomy was performed on March 14, 1947 Since then, although constantly psychotic, she is less fre-

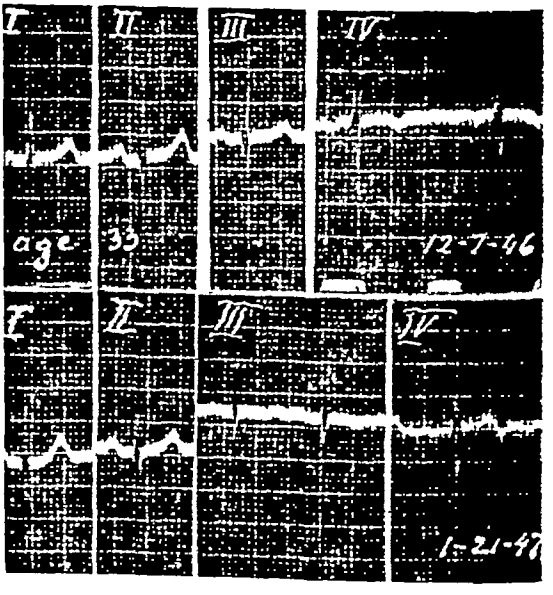

FIG 5

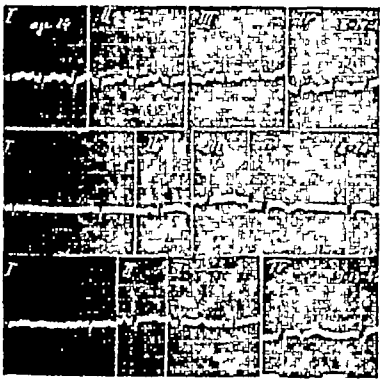

FIG 6

quently disturbed The recent electrocardiogram (Fig 7) was taken while she was in a cooperative mood (the first was taken after seven futile attempts) and shows absent or inverted P_3, absent P_4 low T_4, and a small R_4, while the rhythm is regular

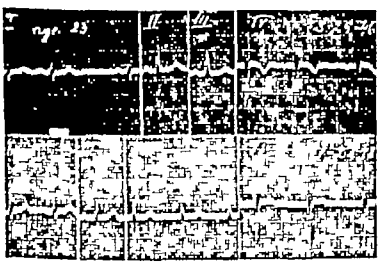

FIG 7

Discussion

Through the studies of Stewart and Manning and Graybiel and his coworkers we have the normal electrocardiographic values in the average healthy young adult [1 2] The findings discussed in this paper are so strikingly different from the norms that their significance cannot be overlooked The extreme shortening of the P R intervals, the frequency of abnormal P and T waves in the chest lead, and the frequent occurrence of ST segment depressions are patterns which deserve comparative studies with experimental work

Experiments on animals and humans demonstrated that mechanical, electrical and pharmacodynamic stimulation of the cardiac parasympathicus and sympathicus causes electrocardiographic changes similar in many ways to those described in this paper Also it was argued that the occasional presence of mixed sympathicotonic and vagotonic ECG changes may be due to a vagotonic state in the auricle and a sympathicotonic state in the ventricle (Bezold's effect) Mixed ECG changes occurred many times in the cases described here (Figs 2, 6)

All the patients in this study presented one or more signs of autonomic imbalance such as hypothermia, excessive sweating and cyanosis of the hands and feet, axillary hyperhidrosis, excessive salvation or excessive dryness of the mouth, vomiting, fecal and urinary retention or incontinence labile pulse rate, labile blood pressure, fever, and erectivity of the pilomotor apparatus The rejection of food may be due to gastrointestinal secretory dysfunction Fear rage, and elation are emotions governed by structures which are in close connection with the autonomic nervous system

It is probable that the electrocardiographic abnormalities under discussion are due to imbalanced autonomic activity causing alterations in the myocardial innervation and in the coronary blood supply Is this disturbed functioning of the higher centers of the autonomic nervous system the cause or the result of catatonic schizophrenia?

Summary

Electrocardiographic abnormalities in catatonic schizophrenia are presented The characteristics of P-R intervals P R, and T waves, and ST segments are discussed

These abnormalities are attributed to the imbalanced autonomic nervous system.

PILONIDAL CYST SURGERY—A MODIFICATION

ALFRED J CANTOR, M D , Flushing, New York

(From the Kew Gardens General Hospital)

MANY operations have been described for the removal of a pilonidal cyst Any of the technics described in the literature will be successful if properly applied In most cases, however, the usual technics require the removal of a very large area outside the actual cyst wall Thus, a large section of normal tissue is removed at the same time that the cyst tissue is removed

This removal of normal tissue increases the size of the resultant wound Healing time is thus prolonged The danger of dead space at the bottom of the wound is increased, and apparent recurrence due to dead space is more frequent The technic to be described avoids these difficulties Practically no normal tissue is removed so that a smaller than average wound results

However, I have described this technic before, and the purpose of this communication is not only to indicate further the simplicity of this technic but to describe one important new feature [1] This new feature is the complete avoidance of hemostatic ligatures

It will be obvious that, if it is not necessary to clamp and tie the multiple bleeders inevitably found in any area of pilonidal surgery, the operating time will be much reduced Furthermore, if the wound is to be closed, the absence of hemostatic ligatures will increase the frequency of successful healing after primary closure The foreign body action of buried sutures is thus avoided Furthermore, the need for hemostatic ligatures being eliminated, the technic becomes even more simple than originally planned and should further quiet the fears of those who are deterred from ambulatory surgery This operation is, of course, completely ambulatory

Most patients who consult the proctologist present infected pilonidal areas However, if there has been no infection, complete excision and primary closure is the procedure of choice If infection has been present recently, the wound is not closed Inasmuch as most wounds will require open surgical excision, it is important that the wound be as small as possible after surgery A minimum amount of tissue should be excised at the time of operation, and it is desirable to avoid the necessity for burying ligatures

All pilonidal surgery may be ambulatory Indeed, practically all rectal surgery may be ambulatory At the present time I find no indication for hospitalization in any case of rectal surgery aside from carcinoma

The anesthetic employed for the excision procedure is usually caudal Forty cc of $1^1/_2$ per cent metycaine is injected into the caudal canal The analgesia develops within five to twenty minutes after injection and is very complete If desired, local analgesia may be employed In such cases a wide local infiltration should be performed through two lateral puncture points Again, $1^1/_2$ per cent metycaine is the anesthetic of choice

Technic

The patient is prepared by shaving and antisepsis The prone position is best, with adhesive strap retraction of the buttocks Analgesia, as above described, is either by wide local infiltration or by caudal block

The initial incision is a midline anteroposterior stroke extending through the sinus and cyst This incision defines both the depth and the anterior and posterior limits of excision If the cyst is not palpable before incision, the initial length of incision should be abbreviated It may be lengthened subsequently as required by the gross pathology The cyst and sinus tissue will be grossly evident as contrasted with the surrounding, normal, yellow fat lobules This primary incision is carried only into normal fatty tissue both anteriorly and posteriorly, it should not be extended unnecessarily If it is extended excessively, it will result in a wider area of excision than is necessary It is only desired to excise the sinus tract, the cyst wall, and a minimum of surrounding normal tissue Most recurrences are due not to residual tract or cyst tissue but rather to residual infection

The depth of this initial incision will be to the sacrum in most cases The next incision is transverse, at the central point of the cyst cavity This incision should extend only into normal fatty tissue on either side of the cyst By means of these two incisions the four outermost points of excision are established under direct vision In so doing, the usual guesswork of the ordinary excision technic is eliminated When these excision points—the anterior, posterior, and two lateral points, are demarcated, they are connected by slightly curved incisions These lateral incisions must completely surround the pathologic tissue In some cases irregular extensions of the

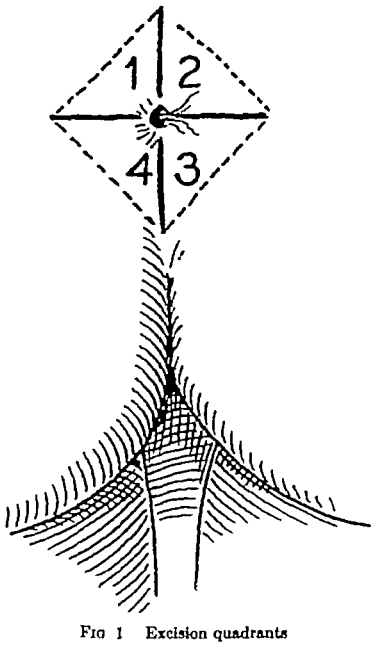

FIG 1 Excision quadrants

diseased tissue will necessitate altering the lines of the connecting incisions. In most cases, however, only a small block of tissue need be excised The resulting wound is extremely small in comparison with the usual massive pilonidal excision technic

The actual excision of pathologic tissue should be carried out in four quadrants (Fig 1) If it is considered that we have an anteroposterior and a transverse incision, it will be recognized that we divide the pathologic tissue into four sections Each section should be removed separately Let us consider that we operate in a clockwise direction and remove the section from nine to twelve first. The moment this section is removed gauze should be packed into the resultant wound (Fig. 2) This gauze should be packed firmly and held in place No hemostats are placed on bleeders The gauze packing will control all ordinary bleeding The next segment to be removed is the segment from 12 to 3 on the clock face. Similarly gauze is packed into this wound immediately upon complete excision (Fig 3) Indeed, the gauze packing should go into the wound as the tissue is elevated by the scalpel. Thus, the tissue will be dissected from the lateral

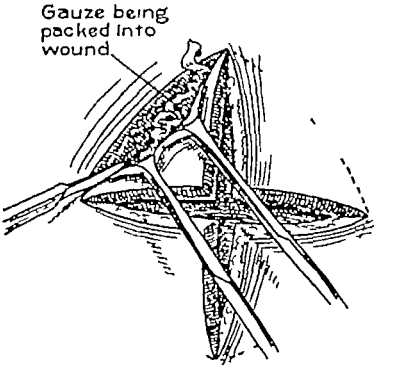

FIG 2 Excision and gauze-packing technic.

excision points inward to the midline, and gauze will be packed into the wound as the tissue is elevated

A similar technic of excision with concurrent packing of gauze employing the usual gauze squares, is followed in the third quadrant from 3 to 6 o clock, and then in the last quadrant from 6 to 9 o clock Of course, this order of excision need not be followed It is here offered as the most convenient However, the operator may remove the segments in any direction desired I might state that this technic of immediate packing with gauze as the dissection proceeds may be employed with any type of pilonidal excision It will produce complete hemostasis without hemostats and ligatures as the operation progresses.

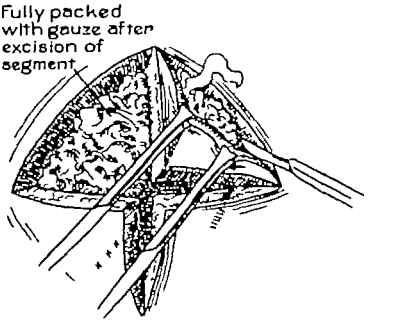

FIG 3 Excision of second quadrant.

If the wound is to be left open, an oxidized cellulose packing* is then placed over the base of the wound and along the lateral walls Gauze squares are then packed over the Oxycel to fill the wound cavity completely

A tight adhesive strapping is then applied I shall not describe here the technic of closure for those wounds that are to be completely closed after surgery This has been described elsewhere in sufficient detail [2] It is my present purpose merely to emphasize the cruciate incision technic for the excision of pilonidal disease It is my further purpose to point out the fact that hemostasis may be very completely accomplished without the use of hemostats or ligatures

Of course, the patient is allowed to leave the operating table, to dress, and to drive his car home, within thirty to forty-five minutes after the completion of the surgery This time interval is necessary to permit the disappearance of all caudal analgesia effect

* Oxycel produced by Parke Davis and Company is an excellent product of this nature.

Summary

One-hundred and eighteen cases have been operated in this fashion to date There has been no postoperative bleeding in any case Healing has been uneventful Healing time has been shortened as a consequence of the minimal area of excision All patients have been ambulatory immediately after surgery and back at their usual occupation within twenty-four to forty eight hours

MENTAL HOSPITALS IN U S ARE 16 3 PER CENT OVERCROWDED

Mental hospitals in this country are overcrowded by 16 3 per cent of their capacity, the United States Public Health Service reported recently

With a normal capacity of 382,426, the state hospitals for mental disease have an average daily resident population of 444,785 persons, or 62,359 more than the institutions should have

The excess runs to more than 50 per cent in a few states At the other end of the range, South Dakota has 13 per cent more capacity than is being used

In New York State the average daily resident population is 76,114, with the normal capacity a 65,697 While personnel shortages in mental hospitals were reported to be abating, this gain is offset by overcrowding and rising maintenance costs

EXPERTS SAY PHYSICIANS ARE UNPREPARED FOR ATOMIC ATTACK

In a recent address in Washington, D C , Rear Admiral Clarence J Brown, assistant chief of the Bureau of Research and Medical Military Specialties, declared that the nation's physicians are unprepared for the emergency of an atomic bomb attack in the event of another war He advocated that all medical practitioners take training in military aspects of medicine "The general public," he said, "may possibly derive some comfort from the hope that threat of retaliation might minimize an enemy attack"

"Not so of the medical profession," he said, "its work begins before any retaliation Long before the retaliation bombs are received by the enemy, we shall be confronted in our great cities by the world's greatest catastrophe, such utter devastation, such unexampled human misery as transcends the imagination During the immediate hours and days which follow, who will bear the burden of the professional care of the survivors? Who will set up the sanitary controls, provide the mass inoculations, insure the safety of food and water supplies, and direct the diagnosis and treatment of those who are suffering insidious radiation illness?"

MANAGEMENT OF SEVERE POSTLUMBAR PUNCTURE HEADACHE

ROBERT E AHEARN, LT J G (MC) USNR, Binghamton, New York

(From the U.S. Naval Hospital Brooklyn)

LUMBAR puncture headache was found to be the most annoying complication in a series of 400 low spinal vaginal deliveries to be reported by Ahearn and Huston [1] The over-all incidence was 10 5 per cent with 10 per cent lasting three or more days These figures were uncorrected and include any reference to headache in the nurses or doctors notes If anything, the figure is high rather than low Nevertheless the problem was of sufficient magnitude to give rise to the following study

The series of cases for this report were selected from a group of several hundred women who were delivered by low spinal anesthesia The anesthetic agent was for the most part, 5 mg of pontocaine in 1 cc of 10 per cent glucose, administered with the patient sitting up, so as to produce a low spinal anesthesia with the hyperbaric solution Usually a Number 20 gage needle was employed, although with a cooperative patient and available time a Number 22 gage needle was used Premedication usually included pentobarbital sodium, demerol, and scopolamine

The patients were permitted to be ambulatory on the second postpartum day Typically the headache would be noticed on the second day after delivery It would be exaggerated by walking or raising the head and relieved by lying down The patient would complain of a dull ache in the occipital region and behind the eyes The neck muscles would become stiff A heavy weight seemed to press on the cranium and cloud the mental processes Some had anorexia, nausea, and vomiting Usually, the headache would improve as the days went by, but sometimes the patient s complaints would persist day after day much to the distress of her physician

Aspirin and even codeine proved to be of little relief for the severe case Infusions of glucose and saline did not alter the condition Caffeine sodium benzoate and nicotinic acid did not help A rare patient seemed to note good results from 50 cc of 50 per cent glucose intravenously but this was transitory We have had little experience with the abdominal compression method of Weintraub but admit that this may give relief by indirectly raising the spinal fluid pressure [2] Amphetamine sulfate in doses of 5 to 10 mg three times daily in mild cases would relieve the headache completely and improve the more severe types This drug was withheld from cardiac and hypertensive patients, and care had to be maintained lest palpitation and tachycardia develop

When the patients with headache were asked to bear down or repeat the Valsalva experiment the pain would disappear Since amphetamine sulfate also raises the spinal fluid pressure, these findings suggested that we were dealing with a spinal fluid hypotension headache [3] Spinal manometric readings on severe cases confirmed this impression This is in agreement with Jacobaeus and Trumerie, more recently Kunkle and Ray Wolff, and others [4 5] The spinal fluid pressure is often found to be inversely proportional to the degree of the headache In some cases no fluid at all could be aspirated with the patient on her side and when sitting up, only a small amount could be secured These facts would help to rule out the meningeal irritation theory

It would seem logical then that the spinal fluid escapes into the extradural space through the puncture hole This escape is augmented by labor and bearing down During contractions, the fluid will shoot out of the needle under a marked increase in pressure With the patient in active labor, difficulty in keeping the patient in position may necessitate multiple perforations of the dura before a definite tap is secured. This factor as well as large needle size, seems to provoke headaches The few drops of initial fluid loss associated with the spinal anesthesia do not seem to have any bearing on the incidence of headaches Kunkle has pointed out that headache can be produced experimentally by withdrawal of approximately 20 cc of spinal fluid with the patient erect [6] Investigators doing encephalography report an extremely high incidence of severe headaches that arise immediately after the spinal fluid is drawn off [6] This seems to be more related to the amount of fluid drawn off than the gas injected We feel that the anesthetic agent for the deliveries played no part in causing the headaches In fact, diagnostic spinal punctures run a high incidence of difficulty as witness the 10 per cent of Underwood [7]

It comes to mind then that if we are dealing with a spinal hypotension headache that does not respond to drugs and measures that raise the pressure and relieve the pain, the next choice would be to replace the fluid Pickering in 1939 injected warm saline solution into the sub-

arachnoid space with relief of headache in a patient [8] This is a preliminary report on a relatively small series of cases in which this procedure was carried out for a therapeutic effect

Method

It was found that when even as little as 5 cc of glucose in distilled water or glucose in saline solution were injected intrathecally, the headache would start to disappear By the time 15 cc had been injected, the headache was almost invariably gone An attempt was made to add enough fluid to approximate normal spinal fluid pressure as recorded by a water manometer No more than 20 cc was injected into any one patient

Extreme care was employed in carrying out this infusion technic Fresh, sterile solutions were used Autoclaved instruments were employed The operator performed a surgical scrub and draped the back of the patient after preparation with soap and merthiolate A Number 22 gage needle was used, and it had to be inserted skillfully with the first attempt One must look for beads of fluid on the stylet and wait for the appearance of a drop of liquid or even aspirate, if in doubt about the location of the needle One must bear in mind that the pressure will be low It is understood that more accurate readings could be taken with a larger needle, but it is imperative to keep this second perforation small Before readings were taken, the patient was encouraged to cough or bear down in order to raise the fluid level in the manometer to a true figure In this series most of the infusions were performed with the patient sitting up, but pressures were also checked with the needle still in place and the patient permitted to lie on her side The movement certainly is liable to tear a larger hole in the dura and for treatment is to be discouraged The glucose in saline solution was added fractionally, 5 cc at a time Pressure readings were taken after each injection

After the infusion, the patient rests on her back for about an hour This is done so as to avoid establishing a channel of flow through the dura Thereafter, she is permitted to be up and about Adler has observed that the eventual incidence of headache is not influenced by early ambulation after lumbar puncture [9] Perhaps we have false hopes that the dura hole may close fairly soon Mixter and Castro Silva point out that, at the time of operation when the dura was exposed, the hole could be identified six and even sixteen days after the tap [10 11] The headache runs a natural course of one to ten days, so probably the perforations close fairly soon With a small sharp needle the dural incision may close like a cut in a rubber tube and leave no hole at all Moreover, the restoration of spinal fluid is assisted by an increase in its production as the result of repeated or persistent drainage of fluid [12]

Results

All of the 14 patients treated had immediate and complete relief of pressure and pain This is apparently diagnostic If the headache is not relieved during the treatment, either the needle is not in place and should be checked, or else there is another cause Almost all the patients had satisfactory relief for the first twelve to twenty-four hours If they remain well for twelve hours after this time, cure is fairly certain One patient had full return of symptoms at this time, but the pain gradually subsided over the next three days This was the only patient in the series who rested on her abdomen after the treatment Perhaps this was just a coincidence Five may be considered immediate and complete cures Eight had return of headache from a 10 to 30 per cent degree for one to three days This trouble could be alleviated by aspirin, codeine, or amphetamine sulfate In no case was a new headache established

None of the cases tested seemed to be on the verge of a spontaneous recovery, so relief must be attributed more to the treatment than to a natural course of events An occasional patient would complain of pain in the legs or in the back if the fluid were injected too rapidly This would disappear immediately There were no other adverse effects noted immediately or later, including a six-week follow-up There were no significant variations in the blood pressure before or after treatment or from other patients who had spinal anesthesia A more detailed picture of results is portrayed in Table 1

Percentage of relief thereafter	100	100	90	95	85	95	10	100	70	80	100	90	75	100

Discussion

A total of 14 patients have received the infusion treatment None of them complained about the ordeal of the procedure itself All were anxious to try anything that might relieve their plight All felt that it was worth the inconvenience involved and certainly would like to have the same treatment if they had this type of headache again.

The five most complete results were with 5 per cent glucose in physiologic saline solution rather than just glucose in distilled water Perhaps this was due to a more hypertonic effect and the attraction of more fluid It was observed that there were no definite levels to which the spinal fluid pressure could be raised by a certain amount of fluid being injected The average increase of manometric level was 125 mm of water This included a 110-mm increase by 10 cc of glucose in saline and 65 mm by 20 cc glucose in water Exactly how much fluid is needed for relief is a question. Fifteen to twenty cubic centimeters seems to be an average amount needed to restore the pressure to near normal As little as 10 cc , however, has resulted in two complete cures with restoration of normal pressure from a level of zero This is in spite of the fact that the spinal subarachnoid space has a capacity of between 30 to 100 cc

Immediately, the question comes to mind, "If the fluid leaks from the first dural perforation, why does not another puncture just aggravate the problem?" In some it probably would, although this has not occurred in this small series In many cases this is hard to explain, especially in those patients who had a single perforation for anesthesia with a Number 22 gage needle In the treatment, however, we do take a great deal of care when performing the lumbar puncture Multiple perforations with a large needle are to be avoided. We elect to perform the infusion in the same interspace as the original feeling that in this locality the tissue repair work is already under way and the new hole will be closed sooner MacRobert suggested that the arachnoid may act both as a plug for the hole in the dura and as a wick facilitating the seepage of cerebrospinal fluid out of the canal into the epidural space [13] Thus variations in the behavior of the arachnoid at different times may account for headache at one time and no difficulty later The lumbar puncture is carried out with the patient sitting up because due to low pressure, too often no fluid will return when the patient is on her side This may result in repeated perforations and a poor result

We feel that, even though the series is small, the results are significant Certainly the treatment is not a 100 per cent cure, but usually it will help the distressed patient Apparently, the patient stands about a 30 to 40 per cent chance of being almost completely relieved and can be made no worse With proper care the injection of 20 cc of glucose-saline solution is no more hazardous than a spinal anesthesia and probably less so Moreover, it is a procedure that should be carried out on the rare patient who has a headache severe enough so that it promises to last The graph (Fig 1) illustrates that most headaches only last from one to three days. These can be overlooked The headache that is getting better can be treated with aspirin and codeine However the patient wants something done about the headache that persists and does not improve The procedure described in this paper offers these people an opportunity for relief

Summary

1 The high incidence of postlumbar puncture headache has been cited

2 The "leakage theory" of etiology is discussed

3 Replacement of the lost spinal fluid by intrathecal infusion is suggested as a means of relief of severe headaches

4 Good results in this small series of cases suggest further trial of this method

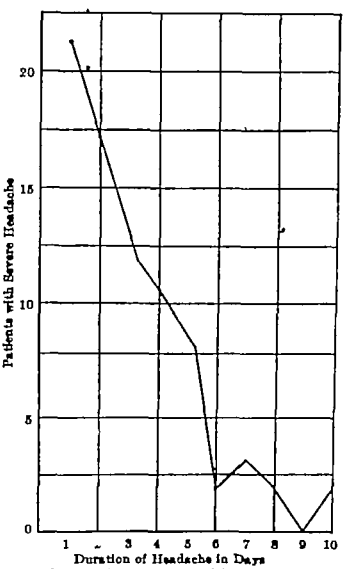

FIG 1 Graph of 79 patients with severe headache

5 In no case was the headache exaggerated nor did any complication arise

FELLOWSHIPS IN CHILD GUIDANCE CLINIC PSYCHIATRY

The American Association of Psychiatric Clinics for Children is offering fellowships for training in child guidance clinic psychiatry under the auspices of the U S Public Health Service, the Commonwealth Fund, and some local funds The training is for positions in community clinics where psychiatrists, psychologists, social workers, and others collaborate in the treatment of children with emotional or mental illness Most of the fellowships are for two years, some for one The stipend is $3,000 for the first year, more for the second Prerequisites are graduation from an approved medical school, a general internship, and two years of general psychiatry

Opportunity is provided for the fellow to develop his own skills in an outpatient service with the support of a carefully planned training program and adequate supervision The training centers are selected on the basis of standards which have been established by the association, and the fellowships are awarded by a committee of this organization For information write Dr Abraham Z Barhash, executive assistant, the American Association of Psychiatric Clinics for Children, 1790 Broadway, New York City 19

NEW DIAGNOSTIC TESTS FOR WORM DISEASES

A new diagnostic test which will help toward better treatment of diseases afflicting hundreds of millions of people throughout the world was announced at the Congress of Tropical Medicine and Malaria in Washington, D C

The diseases are hookworm and the fluke-caused sickness called schistosomiasis The test would probably be effective for any disease in which worms or flukes get into the body and give off eggs It was devised by Drs Elmer H Loughlin, Samuel H Spitz, Richard H Bennett, and Jerome P Margolies of Long Island College of Medicine, Brooklyn

With this test, doctors will be able for the first time to tell exactly how many hookworms or blood flukes are in the patient's body He can then prescribe much more exactly the amount of medicine needed to free the patient of the worms or flukes, and get him well

The test also makes possible for the first time accurate diagnosis of these diseases in patients having only a light infection This will help many who come back from the tropics with a vague intestinal disorder that baffles the doctor and does not get better under ordinary treatment But with the new test, the doctor can find out exactly what does ail the patient and give a drug that will cure him

Schistosomiasis is found in Egypt, many Mediterranean countries, China, Japan, and the Philippines The flukes are carried by snails Humans get them from drinking or bathing in infested waters Some 85,000,000 persons throughout the world are afflicted with this condition and another 457,000,000 have hookworm, according to surveys based on previous tests for the disease But these tests only showed heavy infections If the light infections that can be detected by the new test were found, the total figures would be very much higher

One out of every three or four persons in the United States is probably carrying some kind of worm or fluke or ameba in his body, the Long Island doctors estimate They base this on the numbers they are finding in Brooklyn with their new test Many who have these worms and other parasites do not know it and may not even be sick But there is danger of their spreading the diseases, just as healthy carriers of typhoid germs can unknowingly spread that disease

Tests for the fluke and worm diseases all depend on finding the eggs in the intestinal wastes The new test concentrates the eggs, so that even if there are only a few, they will be detected Since it is quantitative, and since scientists know how many eggs a female hookworm, for example, will discharge in a day, the test gives the number of worms in the patient's body The shape, size, and structure of the eggs, seen under the microscope, tell which kind of worm or fluke the patient is harboring —*Science News Letter, May 22, 1948*

Case Reports

CAROTID SINUS SYNDROME

MILTON H MORRIS M D , Far Rockaway New York

(From the St. Joseph's Hospital)

THERE are many reflex phenomena associated with the cardiovascular system They have a regulatory and protective mechanism and are so delicately balanced that they create equilibrium and stability in the organism The carotid sinus reflex and its associated syndrome is the most common and the most thoroughly understood The wide distribution of its afferent and efferent pathways permits this reflex to present bizarre and diverse symptomatology referable to different organs and systems such as the brain the respiratory and gastrointestinal tracts and the heart. It is the resultant symptomatology and alteration of cardiovascular physiology that the following case emphasizes

Case Report

This patient (Case no 80110) was admitted to the St. Joseph s Hospital by ambulance He was found on the floor in a dazed condition and had considerable emesis

The patient's past history revealed an hernior rhaphy in 1939 He has complained of pain in the lower back for the past two years, a condition diagnosed by his physician as a 'spurred vertebra He also stated that he never wore a collar or tie as he felt weak and experienced peculiar feelings on the few occasions that he was so dressed

Following a restful night's sleep he attempted to put bundles in place He suddenly became dizzy perspired freely and vomited. He said that everything became blank, and it was in this condition of semiconsciousness that he was found by the ambulance surgeon and removed to the hospital

Physical examination—The patient was an adult man, 47 years of age His general body nourishment was poor He was dazed and not fully coherent. He would vomit bile at intervals. A complete neurologic examination was negative. Ophthalmoscopic examination showed a moderate degree of sclerosis of the retinal vessels. Both radial vessels were sclerotic. His temperature on admission was 98 F The pulse was regular 60 per minute, and of small volume. The blood pressure was 170/106 At the apex the heart sounds were of good quality, no murmurs were present. The aortic second sound was increased The lungs were clear The abdomen was negative. An emergency catheterized urine was negative The following day, an electrocardiogram was taken during which pressure was exerted to the right carotid sinus (Fig. 1) During this procedure the patient said he felt lightheaded. This was followed immediately by a period of complete unconsciousness, during which he experienced a left-sided clonic convulsion. There was a complete absence of heart sounds at the apex, and the radial pulse was not obtainable. When he regained consciousness he complained of a severe headache and felt weak, a condition which lasted a greater part of that day

X ray of the chest showed no pathologic changes in the lungs. The cardiac shadow appeared slightly rotated to the left and posteriorly The aorta was not widened X ray of the soft tissues of the neck showed no abnormal shadows. The cervical spine showed a moderate degree of hypertrophic osteoarthritis involving the lower four vertebrae, with narrowing of the disk between the sixth and seventh cervical vertebrae

The blood count showed 95 per cent hemoglobin, 4 930 000 red blood cells 12,800 white blood cells 86 per cent polynuclear neutrophils, 12 per cent lymphocytes, and 2 per cent monocytes. The sedimentation rate was 21 mm. in one hour

A urine specimen examined on the third day after admission was negative except for a trace of albumin

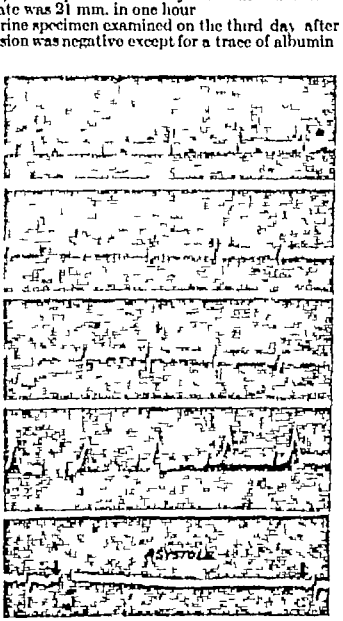

FIG 1 Standard limb leads and precordial lead Cf-4 Lead II shows an isoelectric T Carotid sinus pressure (right), applied in Lead III, shows complete asystole of over 4 seconds With the absence of heart beat the patient experienced unconsciousness and left-sided convulsion

Treatment—During the patient's stay in the hospital, he was given a diet of 1,500 calories daily, with feedings distributed four times a day He was instructed to remain in a reclining position and not to move his head unless necessary A daily soapsuds enema was given Belladonal (Sandoz), which is composed of 50 mg of phenobarbital and 0 25 mg of bellafoline, was given three times a day fifteen minutes before meals This regime has been followed for the past six months, while the patient has resumed his former occupation He has had no attacks during the period of dietary and medical routine There have been no signs of belladonna intoxication

Discussion—Since the original description of the activity of the carotid sinus by Hering, this common reflex has explained many symptoms and states in individuals who were classified as psychoneurotics and neurocirculatory asthenics Others were diagnosed as potential cardiacs or as having vascular instability of vasomotor origin Friedman described an anginal syndrome with a hyperactive carotid sinus, Weiss reports the occurrence of syncope and convulsions, Stern describes the abdominal manifestations of a sensitive carotid sinus [1-3] It also has been reported that artificial stimulation of the sinus is not without danger Askey reports ten cases of hemiplegia following stimulation of the sinus [4] Marmor records the occurrence of bilateral thrombosis of the anterior cerebral artery following artificial stimulation of the carotid sinus [5]

The above case is of interest in that it demonstrates the occurrence of diverse symptomatology referable to the heart, vasomotor system, the cerebrum, and the gastrointestinal tract Artificial stimulation by digital pressure over the right carotid sinus reproduced the clinical picture and, as recorded with the electrocardiogram, a period of complete cardiac asystole lasting over four seconds There also was recorded a disappearance of the heart sounds and arterial pulse tracing

The use of atropine and its derivatives in the treatment of the hyperactive carotid sinus is explained by the pharmacology of the drug Atropine causes an acceleration of heart rate due to blocking of vagal effects on the sino-auricular pacemaker Adequate doses of atropine not only remove the heart from normal vagal control but also prevent typical cardiac arrest from electrical stimulation of the vagus

The phenobarbital is used in conjunction with the atropine in that it is a general depressant to the central nervous system and, in raising the threshold to stimuli, prevents the occurrence of the reflex of which the carotid sinus is a part

Summary and Conclusion

1 A case of a hypersensitive carotid sinus and its associated syndrome is presented

2 The value of belladonna and phenobarbital for the relief of the condition is suggested.

3 The diagnosis of the carotid sinus syndrome depends on the spontaneous occurrence of the syndrome and the ability to reproduce the clinical picture by artificial stimulation of the sinus

4 The above case is of interest in that it presented a vagal, depressor, and cerebral reaction of the sinus

5 It is suggested that further study of the carotid sinus reflex and other vascular reflexes may demonstrate that they may not only alter normal physiology but may cause permanent pathologic states in the cardiovascular system

TRAINING FELLOWSHIPS IN PUBLIC HEALTH EDUCATION OFFERED

Fellowships for graduate study in public health education, previously administered by the United States Public Health Service, are now being administered by the National Foundation for Infantile Paralysis Fellowships amount to $100 a month, plus tuition, as well as certain fees and transportation, in connection with field work. Partial fellowships are available to veterans to supplement amounts for maintenance under the G I Bill of Rights

Applicants must be between the ages of 22 and 40, inclusive, must be citizens or must have applied for citizenship Also required is an A B or B S degree plus some additional qualifications such as a master's degree, three years' experience in the field of public health or an allied field, or other evidence of special interest State and local health department employes are not eligible

Students accepting fellowships must agree to complete the school year, and, in addition, three months of field training, and accept employment in the United States or its territories

Candidates should write for application blanks to Credential Secretary, Division of Professional Education, National Foundation for Infantile Paralysis, 120 Broadway, New York City 5

UNUSUAL REACTION TO THIOURACIL

IRVING GREENFIELD M D , F A C P , Woodmere, New York

(*From the Long Island College of Medicine*)

INDISCRIMINATE condemnation of a therapeutic agent or procedure because of toxic or untoward reactions to its use is not indicated Instead knowledge of these reactions should be recorded so they may serve as a cautionary guide in the proper use of the form of therapy The purpose of this communication is to add an unusual reaction to thiouracil to the literature which already contains reports indicating that the administration of this antithyroid agent is not without some danger

Case Report

For a period of approximately three years prior to the time when this 30-year-old white woman came under observation she complained of progressively increasing nervousness, intolerance to heat and cold and restlessness Notwithstanding a large appetite there was progressive weight loss Tremor of the fingers was noted Subsequently she reported that her body temperature appeared warmer than it had been. On several occasions however rectal temperatures were normal She further observed that during the cold winter months she required less protective outer clothing as well as less bed covering than previously More recently, progressively increasing tendency to fatigability palpitation, paroxysms of choking, excessive perspiration, emotional instability and sleeplessness with frightening dreams were added to the clinical picture

The pertinent findings on physical examination were as follows. The weight was 105 pounds and the height 60 inches The blood pressure was 120/60 She was extremely high strung and agitated. The Stellwag, Moebius and von Graef signs were present. The conjunctivae were unusually bright. The skin was warm and silky There was moderate exophthalmos. The thyroid gland was slightly enlarged and granular Active pulsations were present over the superior thyroid vessels, and a bruit was audible bilaterally A fine tremor of the extended fingers was noted The skin of the axillae as well as of the palms of both hands, was wet with perspiration. Other than the presence of a tachycardia the remainder of the examination was normal.

Laboratory data were as follows hemoglobin 80 per cent, red blood cells 4 724,000 white blood cells, 8,250 polymorphonuclear leukocytes 61 per cent lymphocytes, 38 per cent and transitional cells 1 per cent. The urine was chemically and microscopically normal The blood urea was 18.7 mg. per cent, sugar 74 mg. per cent, and cholesterol 237 mg. per cent. The electrocardiogram revealed a sinus tachycardia. There were no abnormalities of the P waves the ventricular complexes, or the T waves. A teleoroentgenogram was normal The basal metabolic rate was plus 52 per cent.

The patient received 125 mg. of thiouracil daily in divided doses The response was dramatic. Within five days the tremor had diminished considerably The nervousness subsided The attitude of the patient was now one in which she appeared relaxed and calm.

The laboratory data kept pace with the change in the clinical picture The basal metabolic rate was now plus 23 per cent She gained two pounds. The white cell count was 8 700 with a differential of 46 per cent polymorphonuclear leukocytes 42 per cent lymphocytes 9 per cent monocytes and 2 per cent eosinophils The therapy was maintained, and after ten days the white cell count dropped to 7 400 The differential count remained essentially unchanged The blood cholesterol was 201 mg. per cent and the basal metabolic rate plus 19 per cent. The patient was then discharged from the hospital after she had taken a total of 12 5 Gm of thiouracil Her condition had improved considerably Because of the slight drop in the total white cell count the dosage of the thiouracil was diminished to 75 mg. in divided doses daily On discharge the usual effects of the thiouracil were evident. The exophthalmos was more prominent. The fullness of the neck was more noticeable and the thyroid gland was more granular

Three days after her arrival at home the following additional history was obtained. Approximately one week after the start of the thiouracil pruritis of the palms of the hands was noted At first it appeared only at night and was present for a brief period of time. Therefore, no mention was made concerning it. The pruritis gradually involved larger areas so that after an interval of two weeks it became universal. Large doses of hypnotics were required to keep the patient from scratching the pruritic areas until they bled. The antithyroid drug was discontinued. A blood count at this time revealed essentially the same findings noted previously The blood contained no demonstrable reagins. The pruritis was obstinate and resisted all therapy for three weeks. It then subsided gradually but by that time the symptoms of thyro-intoxication reappeared. At this point propyl thiouracil* was given. Tolerance to this drug was excellent, and the hyperthyroidism was adequately controlled.

Discussion

There are several points of interest in this case report which can be emphasized. On the tenth day following the institution of thiouracil therapy the white blood cell count dropped perhaps not significantly but nevertheless it did drop There was no significant change in the differential count. In spite of the fact that the change was slight the dosage of the thiouracil was diminished. Careful inquiry subsequently revealed that the pruritis made its onset at approximately the time when the drop in the leukocyte count occurred. When the pruritis became universal it was of interest to note that there were no objective cutaneous allergic manifestations other than the scratch marks At the height of the pruritis and again at a subsequent date, the blood contained no reagins to thiouracil. Under this regime it was of interest to note the reciprocal relationship of the basal metabolic rate to the level of the blood cholesterol

The role which the MacKenzies and Astwood played in calling attention to the use of thio-urea is well known.[1,2] These observers showed that, following its use, the thyroid gland underwent hyperplasia, the basal metabolic rate fell, the anterior lobe of the pituitary gland underwent changes similar to those noted following thyroidectomy, and iodine was ineffective in counteracting these changes Astwood subsequently reported concerning the use of thio-urea and thiouracil in the treatment of hyperthyroidism[3] Since then, much useful data concerning the untoward and toxic reactions to this chemical have accumulated Gabrilove and his coworkers encountered untoward reactions in 31 per cent of 54 patients whom they treated[4] Barr and Shorr abandoned the use of thiouracil in the treatment of nine of the group of 100 patients because of unfavorable reactions which they attributed to the drug[5] Thiouracil was also discontinued in 7 2 per cent of the 246 cases treated by Williams[6]

The recorded unfavorable reactions lend themselves readily to division into two groups There were those unfavorable reactions which, although they were attributable to the chemical, were not considered contraindications to the continued use of the drug Into this group were such reactions as conjunctivitis, edema, dizziness, and generalized pains and aches The second group consisted of those unfavorable reactions which were serious enough to be considered contraindications to the continued use of the antithyroid agent Into this group fell the drug fevers, with and without the rashes, agranulocytosis, and leukopenia In addition to these later untoward reactions, Di Palma and Ma Govern noted the occurrence of nocturnal dyspnea and in one patient symptoms which suggested coronary artery occlusion Water retention and myxedema were noted following the administration of thiouracil[5-7]

A survey of the literature has failed to reveal any reaction to thiouracil similar to that recorded in this communication[8] It is for this reason that this presentation is added to the growing literature on the subject

Summary

Generalized pruritis, heretofore unrecorded in or during thiouracil administration, is noted Attention is again directed to another chemical capable of producing untoward reactions but to which reagins have not as yet been demonstrated in the blood

ASPIRATION OF BONE MARROW FROM THE ILIAC CREST

Dr Michael A Rubinstein of the Montefiore Hospital, New York City, described at a meeting of the New York Academy of Medicine the advantages of the iliac aspiration technic versus the sternal technic

These are, he said, safety, as no serious injury can be sustained by any underlying organ, ease, the procedure usually being less painful, and the patient being less apprehensive than when subjected to a puncture in the cardiac area, repeated aspirations iliac crest puncture can easily be performed at frequent intervals at both sides of the body, and is, therefore, very suitable for serial bone marrow studies Moreover, the bone marrow cavities of the iliac crest can occasionally be used as a route of administering fluids into the general circulation when no intravenous route is available, and may perhaps allow for greater safety than the sternal technic

Some disadvantage of iliac aspiration is occasional difficulty in puncturing the bone which at times may prove to be exceedingly hard The cells of the iliac bone marrow have been studied for the past four and a half years in about 1,000 different cases showing normal and pathologic findings In about 300 of these instances, simultaneous sternal marrow studies were also performed

The normal values of the iliac bone marrow, the total cellular count, as well as the cell distribution, were found to have approximately the same range as those determined for the sternal aspiration Normally the iliac crest contains hemopoietically active bone marrow in all age groups studied (age range 16–18 years)

In most of the cases studied the findings from both sources run parallel, and the iliac marrow presents the characteristic picture of the disease as seen in the sternal aspiration However, in certain instances the iliac aspiration has proved of distinct diagnostic advantage, as compared to the sternal aspiration alone.

DYSTROPHIA MYOTONICA COMPLICATED BY THROMBO ANGIITIS OBLITERANS AND PSEUDOHYPERTROPHIC MUSCULAR DYSTROPHY

IRVING LEINWAND, M D , New York City

(From the Division of Peripheral Vascular Disease Department of Medicine New York Post-Graduate Medical School and Hospital)

IN THE literature on dystrophia myotonica or myotonia atrophica as it was previously called there are many instances of patients who had difficulty in walking In practically all of these cases this was attributed to involvement of the quadriceps femoris and the dorsiflexors of the foot with consequent "foot drop and inability to raise the leg In no case was there a history of intermittent claudication that is inability to walk more than a given distance at a time without production of a cramp-like pain in the calf muscles. The incidence of dystrophia myotonica is probably much greater than is commonly accepted since as Waring and his coworkers pointed out the disease is most likely to be first recognized where it appears in an earlier generation rather than at a later age.[1]

Since the disease affects the muscles so dramatically and the symptoms produced overshadow most others it is probable that the vascular system in most instances received no more than a cursory examination. For this reason the following case is presented

Case Report

This 48-year-old man was first seen in the clinic on February 13, 1940 He complained of a cramp-like pain in the right foot and calf produced by walking. He could walk no more than one city block without being compelled to stop because of pain This pain was relieved by rest. The complaint had been present for three and one-half years previous to his clinic admission For the past four years the patient had had generalized progressive muscular weakness most evident in the extremities. His only other complaints were occasional epigastric distress and fairly constant difficulty in swallowing. He had smoked a package of cigarets daily for over twenty years The past history was noncontributory

Family History.—There was no history of any similar disease in the preceding two generations. There was no cataract in either of the parents. His mother died of cancer type and site unknown His father died of heart disease, type unknown. The patient had an eleven-year-old son who was apparently normal except for genitalia which were small and definitely underdeveloped

Physical Examination.—The patient presented a thin mask-like face poor posture was partially bald and wearing glasses He could not lift himself up on the examining table with his arms He could not stand up straight nor rise from the supine position. The pupils were equal and regular reacted to light and accommodation Fundi were negative

The heart disclosed a regular sinus rhythm apex beat in the fifth interspace in the midclavicular line No murmurs were heard, and the sounds were clear Blood pressure was 110/70

There was no abdominal tenderness or rigidity no palpable masses and liver kidneys, and spleen were not palpable There was marked lumbar lordosis with thoracic scoliosis.

The hand grip was poor He could not compress the bulb of the ordinary sphygmomanometer The muscles of the upper extremities were moderately atrophied and flaccid The calf muscles of both legs were enlarged and firm.

No genital abnormalities were noted other than small testicles

The gait was on a broad base. The cranial nerves were not involved All of the deep reflexes of the upper and lower extremities were diminished and produced only with reinforcement There was marked weakness of all the muscles of the back and of the sternocleidomastoid muscles. No abnormal reflexes were present

Pulsations were obtained in all the major vessels in the left leg and in the upper extremities. In the right leg there was no pulsation noted below that of the femoral artery in the femoral triangle Oscillometric readings were as follows (1) maximum of $^1/_2$ degree in the left foot none in the right; (2) maximum of $2^1/_2$ degrees in the left leg above the ankle maximum of $^1/_2$ degree in the right and (3) maximum of $4^1/_2$ degrees below the knee in the left leg maximum of $^1/_2$ degree in the right.

This patient had been seen by a neurologist in November 1937 three years before he came to this clinic. Examination at that time revealed the following There was no deformity of the spine There was marked weakness of the upper extremities. The patient was unable to open the fists readily after closing them There was definite indentation on percussion of the tongue. Both calves were markedly hypertrophied with not much weakness The diagnosis at that time was myotonia atrophica complicated by pseudohypertrophic muscular dystrophy

Two years later a biopsy of the gastrocnemius was performed in another hospital There was evidence of degeneration of the muscle fibers but the histologic picture was not typical of any disease

Laboratory Studies.—On May 8 1940 the Wassermann (blood) and urinalysis were negative The basal metabolic rate was minus five The cholesterol was 220 mg per cent, and the esters were 105 the ratio being 48 per cent. The true glucose measured 65 per cent. The inorganic phosphate was 3.2 mg. per cent and the calcium was 10 1 The urea clearance test was 126 per cent after the first hour and 116 per cent after the second hour

The results from the electrocardiogram were as follows The rhythm was regular The PR interval was 0 16 second, and the QRS interval was 0 12 second. There was left axis deviation, intraventricular block and T_3 was inverted. The electroencephalogram showed changes suggestive of atrophy of the cortex.

The Landis test (to measure vasodilatation of the peripheral vessels in the right foot) showed no rise in temperature at the end of two hours.

Biopsy of the right calf and back on May 15 1940, showed an increase of mesothelial cells at the point of union of the muscle with fascial bundles. No histologic diagnosis was possible

Course and Treatment.—As a control for future

therapy, the patient was given normal saline (2 cc) intramuscularly once weekly for eight weeks During this time the patient was not allowed to smoke No other therapy was given There was no improvement during this period The patient was then given whole wheat germ oil and vitamin B complex, one dram of each, three times daily He continued this for two months with little change in his status

Previous to his treatment in this clinic the patient had received a variety of therapeutic agents, including quinine, glycine, and creatinine, without relief Prostigmine bromide, 15 grains three times daily, was given him for a short period in this clinic without effect At the end of this time he was given 50 mg alpha tocopherol acetate* together with whole wheat germ oil and vitamin B complex, two drams daily

In the following two months, the patient improved to such a degree that he was able to walk as much as five miles Readings taken at that time revealed no improvement in the degree of oscillation of the involved arteries The calf muscles, however, had softened and appeared smaller in size and more normal in consistency This improvement in the lower extremities was maintained, but his upper extremities remained unaffected During this last period, the patient developed fairly persistent pain of the rheumatic type in the left wrist which resisted therapy In view of the baldness, hypotension, and subnormal secondary sex characteristics, testosterone proprionate,** 25 mg twice weekly, was finally added to his treatment

Re-examination Seven Years Later —In January, 1947, seven years after his first admission to the clinic, examination revealed the following

His dystrophia myotonica had progressed This progress, although markedly apparent, did not completely incapacitate the patient He had difficulty in dressing, and his posture was much less erect He could not close his fist There were no changes in vision In the four-year period that the patient was absent from this clinic, he received treatment elsewhere This treatment included all of the usual therapeutic measures for this disease He stated, however, that he did not feel as well with any other therapy as he did with treatment in this clinic, namely, vitamins B and E and testosterone propionate At the present time he can walk twenty blocks compared to the half block, seven years ago The distance is apparently limited by fatigue of the muscle rather than pain Oscillometric readings (on the same instrument) revealed no change An electrocardiogram revealed the identical abnormalities present seven years ago An electroencephalogram revealed a normal tracing as compared to an abnormal tracing seven years ago It is worthy of note that his son is now fully grown and completely normal

Discussion

In the treatment of thrombo-angiitis obliterans, it is common belief that any form of therapy is useless if the patient continues to smoke This is so true that, if a patient with a mild degree of Buerger's disease stops smoking, his symptoms will usually improve within one to four weeks without any form of therapy It is interesting, therefore, to note that this patient did not improve after eight weeks of not smoking in his first control period After eight more weeks of small doses of whole wheat germ oil, he showed only slight improvement, if any Since the first real improvement was after the administration of the alpha tocopherol acetate, it is felt that the improvement in the lower extremities was probably due primarily to this form of therapy It was also noted that the calf muscles assumed a more normal appearance following this treatment

The thrombo-angiitis was not treated directly in that no attempt was made to increase the flow of blood to the extremity It would thus seem that the improvement in his walking capacity was due to changes in the musculature, rather than to changes in the arterial supply One cannot rule out better collateral circulation secondary to the cessation of the use of tobacco, even though a control period of observation was included. There have been varying reports in the literature regarding efficacy of vitamin E therapy in the treatment of the muscular dystrophies In this particular case, it would seem that the pseudohypertrophic muscular dystrophy may have responded to this form of therapy, and the dystrophia myotonica remained unaffected There has been a recent report in which four of nine patients with pseudohypertrophic muscular dystrophy showed objective improvement on treatment with vitamin E Testosterone proprionate has been reported to be of therapeutic value by several investigators [1 2] Papanicolaou and Falk reported the production of muscular hypertrophy in guinea pigs with use of the androgen [3]

Evidence of vascular disease in this patient was generalized. There were abnormal findings in the electrocardiogram, electroencephalogram, and the oscillometric readings of the right lower extremity Changes in the electrocardiogram have been reported by several investigators [1 4 5] There is also a report in the literature of a case of dystrophia myotonica with scleroderma, a disease which is also associated with marked vascular changes It was noted by Waring and his group, in a study of 13 patients that ten complained of cold hands and feet with cyanosis of varying degrees [1] After a review of the recent reports and an evaluation of this patient, it would seem that vascular disease may be more closely related to this disease than has been previously noted. It is possible that there have been other cases of obliterative arterial disease which have gone unnoticed, because the onset of fatigue in the atrophied muscle prevented sufficient exercise to produce true claudication

We made a clinical diagnosis of thrombo-angiitis obliterans in this patient on a basis of organic arterial disease beginning in a man about 45 years of age, without evidence of arteriosclerosis He had been a heavy smoker of tobacco It is possible, however, that we may have been dealing with an arteritis with occlusion of an unknown nature Finally it would seem by comparison between the findings today and that of seven years ago, that there was no progress of the vascular disease Since there was no apparent improvement in circulation in the impaired leg, the improvement which was apparent seven years ago, and still existed, was prob-

* Ephynal Acetate was provided by Hoffman-La Roche.
** Perandren was provided by Ciba Pharmaceutical Company

ably due to improvement in the musculature of the lower extremities.

Summary

1. A patient with muscular vascular disease is presented.

2. Vitamin E therapy improved the patient's pseudohypertrophic muscular dystrophy but did not affect the dystrophia myotonica. Many other forms of therapy were tried previously without relief.

3. It is suggested that vascular disease may be an intimate part of the disease, dystrophia myotonica.

The clinical picture in this case of the vascular disturbance is that of thrombo-angiitis obliterans.

14 East 65th Street

I wish to express my appreciation to Dr. A. Wilbur Duryee for his suggestions in the preparation of this paper.

DELAYED REACTION TO PENICILLIN TREATED WITH THEPHORIN

Irwin I. Lubowe, M.D., New York City

(From the Skin and Cancer Unit, New York Post-Graduate Medical College)

VARIOUS allergic reactions following the employment of penicillin orally locally, and parenterally have been reported.[1-5] These reactions usually follow the continuous use of the preparations. We are reporting the following case because of the fact that it occurred in a patient who only received one injection of 300,000 units of penicillin suspended in beeswax and peanut oil. The patient presented no clinical evidence of fungus infection. The patient was treated with thephorin,* a new antihistaminic drug, 50 mg. every four hours by mouth with no local therapy. Complete recovery took place in a period of five days. The formula for thephorin is 2-methyl-9-phenyl-2,3,4,9-tetrahydro-1-pyridindrene hydrogen tartrate.

Case Report

A. F. S., a white man, age 38, weight 210 pounds, was referred for the removal of a sebaceous cyst of the cheek on November 28, 1947. The patient gave no history of any serious medical or surgical disease and no history of any allergy or dermatologic disease. The sebaceous cyst, the size of a small olive, was removed from the right side of the cheek over the malar region by means of the Danna electrocoagulation method and the lesion was dressed.[7]

The patient was seen several times for postoperative treatment. On December 5, 1947, he presented a mild secondary infection of the operative area. He was given 300,000 units of penicillin, suspended in beeswax and peanut oil, deeply in the right buttock in the upper and outer quadrant. The penicillin used was the crystalline G penicillin which does not require refrigeration or heating.

When the patient returned for follow-up treatment on December 12, 1947, he complained of severe pain in the right buttock and an itching rash. Examination revealed a diffuse erythematous maculopapular rash involving the face, chest, back, and upper and lower extremities. There was no evidence of any scaling. The right buttock revealed an area of about 5 by 5 inches that was markedly erythematous, swollen, indurated and painful. The center of this area was a little more reddened which evidently was the point of the entrance of the needle. Patient was given thephorin 50 mg. every four hours by mouth for a dose of 200 mg. per day for a period of five days. On December 12, 1947, when the patient returned for examination, the lesions had completely healed, and there was just a small area of redness involving the right buttock.

The patient returned one week later, December 22, 1947, and the infection of the postoperative area was healed. It was decided to determine whether sensitivity to tricophytin and oidomycin existed, and intracutaneous tests of 0.1 cc. of 1:10 tricophytin and 0.1 cc. of 1:40 oidomycin were used with controls. The patient returned in forty-eight hours and seventy-two hours, and no evidence of postoperative reaction was observed. He was then discharged on December 26, 1947, in apparently good health.

Conclusion

We present a patient who had never previously received any penicillin either orally, locally, or by injection and who seven days after intramuscular injection of penicillin in oil and beeswax, 300,000 units, suffered a severe diffuse erythematous maculopapular eruption and a marked area of induration and swelling at the site of inoculation.

Symptoms completely disappeared after the fifth treatment with thephorin, consisting of 200 mg. per day. The reaction was negative to the intracutaneous tests with tricophytin and oidomycin.

CONGENITAL ABSENCE OF THE GALLBLADDER WITH OBSTRUCTIVE JAUNDICE DUE TO A SOLITARY GALLSTONE

FRANCIS X TIMONEY, M D , New York City

(From the First Surgical Division, St Vincent's Hospital)

CONGENITAL absence of the gallbladder is a rare anomaly Interest in this condition is further increased by the presence of a gallstone in the common hepatic duct, causing repeated attacks of obstructive jaundice A case embodying these features is reported

Case Report

A woman, born in Italy, aged 70, was admitted to St Vincent's Hospital, New York City, June 18, 1947 Twelve hours before admission, the patient experienced a sudden attack of severe pain in the right upper quadrant of the abdomen, accompanied by vomiting The pain and vomiting persisted until the time of admission There was marked language difficulty, but in spite of this, a history of recurrent colic in the left upper abdominal quadrant was obtained. These attacks were accompanied by nausea and vomiting

Physical Examination.—The temperature was 102 F , pulse 88, respiration 24, and the blood pressure was 120/80 mm The white blood count was 14,000 with 85 per cent polymorphonuclear leukocytes The abdomen was scaphoid, and no masses could be felt Muscle spasm and tenderness were present in the right upper quadrant

The preoperative diagnosis was acute cholecystitis with cholelithiasis

Course.—Operation was performed under general anesthesia using pentothal sodium, cyclopropane sequence Through a right subcostal incision, the undersurface of the liver was exposed. Many adhesions between the liver, duodenum, and surrounding structures were separated An intensive search was made for a gallbladder None was found Operation was discontinued after one hour because of the increasingly poor condition of the patient

Jaundice became manifest after operation On the fifth postoperative day the serum bilirubin was 8 7 mg per 100 cc of blood The postoperative course was stormy The pulse rate was elevated, and the temperature, which ran a septic course, subsided on the thirtieth postoperative day In reviewing the postoperative course, the type of fever, and the jaundice, the general clinical picture was consistent with that seen in a common duct stone with cholangitis

On August 9, 1947, the patient was readmitted to the hospital She complained of epigastric pain Examination of the abdomen revealed moderate generalized rigidity and tenderness that was most marked in the subcostal region The following is to be noted on the subsequent dates August 12, 1947, moderate clinical jaundice, August 13, 1947, serum bilirubin 7 3 mg per 100 cc of blood, August 14, 1947, the gallbladder x-ray series with contrast dye, ordered before jaundice was recognized, revealed no gallstones and no visualization of the gallbladder, August 18, 1947, a diagnosis of chronic cholecystitis with a common duct stone was made, August 19, 1947, serum bilirubin 2 5 mg per 100 cc of blood, and August 23, 1947, serum bilirubin 1 8 mg per 100 cc of blood On August 27, 1947, operation was again performed under general anesthesia

Findings.—There was a mass of adhesions involving the stomach, small intestine, falciform ligament, and duodenum to the inferior surface of the liver The dissection was made through a long, right paramedian incision The right and left lobes of the liver and its inferior surface were exposed The position of the organs showed that the anomaly of situs inversus did not exist Careful examination of the undersurface of the liver failed to reveal a gallbladder The foramen of Winslow was entered, and the pulsation of the hepatic artery was felt A thickened and enlarged white common hepatic duct was seen, and, within it, a freely movable stone was felt An incision was made into the common hepatic duct, and a round gallstone, 1 5 cm in diameter, was removed Free-flowing yellow bile was obtained The ducts were probed, and a T-tube was sutured into the common hepatic duct

On September 3, 1947, and on September 10, 1947, cholangiograms (Fig 1) were taken which did not demonstrate either an extrahepatic or an intrahepatic gallbladder or remnant of cystic duct The postoperative course was uneventful, and on the twenty-second postoperative day, with the T-tube *in situ*, the patient was discharged and asked to return to the outpatient department

FIG 1 Cholangiogram. Dilated common duct injected with Diodrast through a T-tube, after the administration of morphine to contract the ampulla A small amount of dye entered the duodenum through the ampulla of Vater

FRIEDLANDER BACILLUS PNEUMONIA TREATED WITH STREPTOMYCIN

JOHN H KEATING JR M D , New York City

(From the Medical Service of St. Luke's Hospital)

SINCE the introduction of streptomycin, there has been new hope in the treatment of pneumonia due to the organisms of the Friedländer group (Klebsiella) The incidence of pneumonia whose causative agent is a member of this group has been reported to be 0 6 to 1 5 per cent of all pneumonias the mortality rate being 84 to 97 per cent.[1 2]

Streptomycin was first shown to be of value in the treatment of Klebsiella pneumoniae infections in 1945 and the first clinical usage was reported later that year.[3 4] However, it was not until 1946 that there was a published case of Friedländer pneumonia treated successfully with streptomycin.[5]

Until the present time, only four additional cases have been reported.[6 7] One of these was, necessarily, inadequately treated because of the appearance of a toxic reaction presumably due to streptomycin, and another case is reported in which it appears doubtful that the primary disease was pneumonia due to organisms of the Friedländer group There is also the report from the National Research Council of 17 cases of acute or chronic pulmonary infections associated with these organisms but a breakdown is not given as regards the percentage of the cases which were primary Friedländer pneumonia.[8 9]

The results of this new form of treatment are somewhat equivocal as to its efficacy It seems therefore pertinent to report another case of primary Friedländer pneumonia treated with streptomycin

Case Report

E K. a 76-year-old, unemployed white Finnish man was admitted to the hospital in November 1947, with the chief complaint of chest pain of four days' duration.

Until the onset of the present illness the patient had no history of any other serious illness injury or operation He stated that for several years he had consumed one to two quarts of beer plus a moderately large intake of whiskey daily but there was no history of unconsciousness due to alcohol During this same period his diet had been inadequate and he relied almost exclusively on meat.

Six days prior to admission he developed an upper respiratory infection, and two days later he had the onset of chills and fever accompanied by a cough productive of a moderate amount of purulent sputum. On the following day there appeared left chest pain on deep breathing and coughing All symptoms persisted until the patient sought medical treatment on the sixth day of his illness

At the time of physical examination he appeared acutely ill slightly cyanotic, and emaciated. He was breathing rapidly and his skin was hot and dry Rectal temperature was 100 pulse 110 respirations 28, and blood pressure 140/80 The left ear drum exhibited definite fullness and was markedly injected in the region of Shrapnell's membrane and along the malleus. No mastoid tenderness was elicited. The tongue was dry and magenta in color with smooth edges, and the throat was red with purulent, stringy exudate The thorax exhibited limited left-sided expansion and there was flatness to percussion over the lower two thirds of the left posterior chest which extended around to the left anterior axillary line. In this area were increased vocal and tactile fremitus and bronchial breathing Coarse rales were heard in the region of the left anterior axillary line. The right lung and heart appeared normal, as did the remainder of the physical examination with the exception of marked peripheral sclerosis of the blood vessels.

On the first hospital day the patient's hemoglobin was 14 5 Gm., white count 6 100 with polymorphonuclears of 84 per cent, lymphocytes 16 per cent and with a slight shift left. On the second day the white count was 5 000, of which 80 per cent were polymorphonuclears 18 per cent lymphocytes and 2 per cent monocytes. On the fourth day there were 10 700 white cells with 92 per cent polymorphonuclears, the remaining 8 per cent being lymphocytes The blood count remained at this level until the eighth day and then gradually returned to normal by the twelfth day Urinalysis on admission and those done subsequently were normal as were the blood chemistry studies. Blood serology was negative and the sedimentation rate was 15 mm per hour Electrocardiogram was within normal limits except for a moderate left axis deviation. The admission x ray of the chest showed a dense area of pneumonic consolidation occupying the entire lower outer half of the left lung field with extension into the retrocardiac area A less dense area of pneumonic infiltration was seen in the mid- and outer portions of the left lung field

Treatment was instituted with various supportive measures and with an intramuscular penicillin regime. The patient however received but one injection as a preliminary report was received from the laboratory that the sputum smear showed only 4 plus Friedländer's bacilli. Penicillin was stopped, and streptomycin intramuscularly was started. It was administered for a total of 2 Gm. daily in divided doses of 0.25 Gm. every three hours. In conjunction with streptomycin, he was given sulfadiazine 1 0 Gm. and sodium bicarbonate 2.6 Gm. every four hours

The initial bacterial culture of sputum was reported as a practically pure culture of Friedländer's bacilli Specific typing sera for the Friedländer group were not available. Repeated blood cultures were negative

On this regime the patient's temperature which ranged between 100 and 102 F reached a normal level on the fifth hospital day Sputum cultures became permanently negative for Friedländer's bacilli on the third day However at this time there first appeared a hemolytic streptococcus and Staphylococcus aureus. X ray of the chest on this third day showed no change as compared to the admission film. Likewise, there was no change in the physical signs of the chest, and examination of the ears showed them to be negative

By the eighth hospital day, after patient had been afebrile and without oxygen for three days, the chest x ray showed partial resolution of the pneumonic process but multiple radiolucent areas were seen in the lower left lung field On auscultation bronchial breathing was not heard but a friction rub was aud

ible in the left axillary line Despite the improved x-ray and clinical findings, the patient on this day had the onset of a daily temperature rise to 101 and 102 F

On the thirteenth hospital day, penicillin treatment was started in a dose of 50,000 units intramuscularly every three hours Sulfadiazine was halted. Within twenty-four hours his temperature began to subside, and from his fifteenth hospital day he was afebrile Streptomycin was stopped on the sixteenth day after a total dosage of 30 5 Gm , and penicillin was stopped on the twentieth hospital day with a total of 2,800,000 units having been administered No sign of streptomycin toxicity was noted

X-ray of the chest on the fourteenth day showed further resolution of the pneumonic process with a few highlights suggestive of lung necrosis with cavitation On the twenty-fifth day the x-ray was interpreted as showing considerable fibrosis throughout the lower two thirds of the left lung but no evidence of cavitation or necrosis.

The patient was allowed up on the twentieth day and discharged on his thirty-first hospital day Physical examination of the chest at this time was negative except for a few scattered rales in the region of the left base

Comment

It will be noted when bacteriologic diagnosis was made that the initial penicillin regime was stopped, as the published results with its use have been uniformly poor, except for one case of bacteremia which apparently was treated successfully [5 6 10 11]

Sulfadiazine was given in conjunction with streptomycin, because it was felt that this was justifiable in view of extending to an extremely ill patient all forms of therapy which offered hope. It has been noted that sulfonamides probably have a place in the treatment of this disease, especially in the early stages, but are probably of little value after suppuration occurs [12] Other reports disagree state they have little or no therapeutic value Since this patient's sputum cleared rapidly, st mycin treatment by means of a nebulizer as junct to therapy was not instituted

The secondary rise in temperature after the good response to streptomycin is interpreted as due to invasion by secondary gram-positive b nonresponsive to sulfadiazine

Summary

1 A case of pneumonia due to Friedl bacillus is presented

2 The response to streptomycin was mar view of patient's age, debility, and overwhelm fection

NEW COMPOUNDS HELP RELIEVE ALLERGIES

New compounds, many stemming from pyridine, a component of coal tar, today seemingly have on the run those allergic symptoms that plague human beings Dr C M Suter, director of the chemical division of the Sterling-Winthrop Research Institute, Rensselaer, New York, addressing a sectional meeting of the American Chemical Society in Erie, Pennsylvania, disclosed that among hundreds of compounds studied, several potent drugs have been discovered to relieve what medicine defines as "a condition of unusual or exaggerated specific susceptibility to a substance harmless in similar amounts to the majority"

People, for instance, allergic to ragweed, or rose pollen, or even cat's fur, feathers, certain grasses, or any number of substances which others can take with ease, are due for long-sought relief, according to Dr Suter "This new group of drugs may well contribute to the comfort of more persons tha other discovery since the barbiturates were made available," Dr Suter said

Dr Suter pointed out that one of the most i tant groups of newer synthetic medicinals is fied generally as "antihistamine agent" H plained that some years ago it became eviden there was a close relation between histam stimulator of the autonomic nervous system allergies

"Several potent drugs have now been disco that counteract or interfere with the action of mine," Dr Suter continued "Chemically the all tertiary amines having two methyl grou tached to nitrogen Most of the active comp are also derivatives of 2-aminopyridine, wh turn is made from pyridine, a component o tar"

DEPARTMENT OF MEDICAL CARE INSURANCE

CONDUCTED BY GEORGE P FARRELL, *Director*

QUARTERLY report on membership in voluntary nonprofit medical care plans in New York State for the period ending March 31 1948 and statement of comparative gains in benefits earned premium income and claims for the first quarter in 1947 and 1948

TABLE 1.—MEMBERSHIP

	United Medical Service Inc New York	Western New York Medical Plan Inc. Buffalo	Medical and Surgical Care, Inc., Utica	Genesee Valley Medical Care Inc. Rochester	Northeastern New York Medical Service Inc. Albany	Central New York Medical Plan Inc. Syracuse	Totals
March 31 1948	833 122	128,779	94,883	50 952	30,017	15 926	1 153 189

TABLE 2.—COMPARISON OF INCURRED BENEFITS TO MEMBERS

	United Medical Service Inc., New York	Western New York Medical Plan, Inc., Buffalo	Medical and Surgical Care, Inc. Utica	Genesee Valley Medical Care Inc., Rochester	Northeastern New York Medical Service Inc. Albany	Central New York Medical Plan, Inc. Syracuse	Totals
1st Quarter 1948	$794,397	$151 851	$142 198	$45 762	$41 698	$32 145	$1,208,051
1st Quarter 1947	444,340	212 471	91 879	7 184	4 788	31 582	792,244
Increase	$350 057	—$ 60 620	$ 50,319	$38 578	$36,910	$ 563	$ 415,807

TABLE 3.—COMPARISON OF EARNED PREMIUM INCOME

	United Medical Service, Inc., New York	Western New York Medical Plan, Inc., Buffalo	Medical and Surgical Care Inc. Utica	Genesee Valley Medical Care, Inc. Rochester	Northeastern New York Medical Service Inc., Albany	Central New York Medical Plan, Inc. Syracuse	Totals
1st Quarter 1948	$1,386,145	$223 612	$186 714	$77 859	$56 669	$42,981	$1 974,010
1st Quarter 1947	778,286	230,200	135,133	26,879	7,394	31,884	1,209 775
Increase	$ 607,859	—$ 6,588	$ 51,582	$51 010	$49,275	$11 097	$ 764,235

TABLE 4.—COMPARISON OF NUMBER OF CLAIMS

	United Medical Service, Inc. New York	Western New York Medical Plan, Inc. Buffalo	Medical and Surgical Care Inc Utica	Genesee Valley Medical Care, Inc. Rochester	Northeastern New York Medical Service, Inc. Albany	Central New York Medical Plan Inc., Syracuse	Totals
1st Quarter 1948	16 179*	4 923	4,855	1 197	890	2 745	40 789
1st Quarter 1947	8,076*	12 999	3,969	146	70	3 450	27 710
Increase	8,103	—8,076	886	1,051	820	295	3,079

Paid basis all others on incurred basis.

With an increase of 129,574 members during the first quarter of 1948, making the total membership 1,153 189 it is reasonable to expect that membership will exceed 1,500 000 by the end of 1948

Incurred benefits to members was $1,208,051 compared to $792 244 for the same period in 1947 representing an increase of $415,807 or 52 per cent.

The plans have shown an increase of 63 per cent in earned premium income during the quarter and 11 per cent increase in claims.

NECROLOGY

Fred S Diefendorf, M D, died on May 19 at his home in Angola His age was seventy-six Dr Diefendorf was graduated from the University of Michigan Medical School in 1898 and had practiced medicine in Sharon Springs and Angola He resigned last year as health officer at Evans after serving in that position for thirty-two years Dr Diefendorf was a member of the American Medical Association and the New York State and Erie County Medical Societies

William Van Pelt Garretson, M D, of New York City, aged sixty-eight, died on June 5 Dr Garretson was graduated from the College of Physicians and Surgeons, Columbia University, in 1903 and studied at the University of Berlin in 1904 and 1905 He taught at New York Polyclinic Hospital starting as a clinical assistant and becoming professor of nervous and mental diseases He was a consulting neurologist at Harlem and Manhattan State Hospitals, New York City, Bayonne Hospital, Bayonne, New Jersey, New York State Reconstruction Home, West Haverstraw, and Lawrence Hospital, Bronxville He was also a consultant in neurology, psychiatry, and endocrinology at St Clare's Hospital, New York City Dr Garretson, a diplomate of the American Board of Psychiatry and Neurology, was a member of the New York Neurological Society, the Association for the Study of Internal Secretion, the New York Society for Clinical Psychiatry, the American Medical Association, and the New York State and County Medical Societies

John Wesley Judd, M D, Ithaca, died on June 6 at the age of seventy-eight Dr Judd was graduated from the University of Vermont College of Medicine in 1896 Retired from active practice, Dr Judd had served as consultant obstetrician at Tioga County Hospital, Waverly, and Tompkins County Memorial Hospital, Ithaca He was a diplomate of the American Board of Obstetrics and Gynecology, a fellow of the American College of Surgeons, and a member of the American Medical Association, the Central New York Association of Obstetricians and Gynecologists, and the New York State and Tompkins County Medical Societies

Frederick Leighton, M D, Niagara Fall, died on June 6 His age was sixty-three A physician in Niagara Falls for the past thirty-five years, Dr Leighton was a graduate of the University of Michigan Medical School in 1909 He served as senior surgeon on the staff of Mt St Mary's and Niagara Falls Hospitals, Niagara Falls A past president of the Niagara Falls Academy of Medicine, Dr Leighton was a member of the American Medical Association and the New York State and Niagara County Medical Societies

Charles Bates Phillips, M D, sixty-three, died at his Amsterdam home on May 11 Dr Phillips was graduated from Albany Medical College in 1908 and had practiced in Amsterdam since that time He was a surgeon on the staffs of Amsterdam City and St Mary's Hospitals, Amsterdam A past president and member of the Montgomery County Medical Society, Dr Phillips was also a member of the American Medical Association and the New York State Medical Society

F Ward Renfrew, M D, Queens, died on April 29 at the age of fifty-five Dr Renfrew was graduated from Cornell University, Medical College, in 1919 and interned at New York Hospital He served with the Army Medical Corps during the first World War Retired since 1946, Dr Renfrew had been an associate surgeon on the staffs of Downtown-Beekman and City Hospitals and was connected with the United States Public Health Service during World War II He was a member of the American Medical Association and the New York State and County Medical Societies

Samuel Stewart, M D, died at his home in Syracuse on May 15 His age was sixty-eight Dr Stewart was graduated from the College of Physicians and Surgeons, Columbia University, in 1906 and had been a practicing physician in Syracuse for forty years He served on the honorary staff of Crouse-Irving Hospital, Syracuse, and was a member of the Syracuse Academy of Medicine, the American Medical Association, and the New York State and Onondaga County Medical Societies

---

NEW YORK'S BLUE CROSS PLAN ISSUES ANNUAL REPORT FOR 1947

The enrollment of 417,191 persons in Associated Hospital Service during 1947 brought the over-all total to 3,206,178, or one out of every three persons in the Greater New York area, according to the 1947 Annual Report

Because approximately 10,000 employers now pay all or part of the subscription charges for their employes, the service has been extended to increasingly large numbers of persons in the lower income groups, the report states The organization's growth also is attributed to the increasing number of unions enrolled

MEDICAL NEWS

Measles Epidemic Decreasing in New York City

THE 1948 measles epidemic which has afflicted 24 310 children in New York this year and caused eighteen deaths is running out, the City Health Department reported in June It added that the peak was passed a few weeks ago

Virtual disappearance of the disease after schools close for the summer can be predicted, health authorities said. May the first month since the start of the outbreak to show a decline, brought only 5 102 new cases and five deaths. While the current outbreak will surpass that of 1946, when there were 19,201 cases in the first five months, it will not equal the moderate epidemic of 1944 At this time four years ago there were 24,544 cases of measles reported in New York City

The 1948 incidence will not compare with the record of 79 640 cases for the full year 1941 or equal the fair-size epidemic of 1938 when there were 34 601 cases.

Confinement of the outbreak this year was credited largely to widespread use of gamma globulin a human blood preventative This year the Health Department has obtained from the Red Cross and distributed free to physicians 51 327 doses of the serum to be injected into exposed children under five years of age.

Death Rate for TB at New Low in 1947

DEATHS from tuberculosis in the United States reached a new low in 1947 with 47,636 reported, Dr James E Perkins, managing director of the National Tuberculosis Association, announced at the Association s annual meeting in June in New York City

Basing his reports on provisional figures received from state health departments Dr Perkins said the nation s tuberculosis death rate dropped to 33 2 persons in 100 000 population from a rate of 36 4 in 100 000 in 1946, when 50 911 deaths were reported

New York City's rate was 44.3 in 100 000 last completed a survey to determine the occupational therapy needs of all patients in state hospitals and schools. It was supervised by Miss Virginia Scullin, director of occupational therapy for the department and formerly in charge of that activity

The value of mass chest x ray surveys and services in discovering an estimated 250 000 unknown tuberculosis cases throughout the nation was cited by speakers at a morning session Dr F J Hill Minneapolis Health Commissioner said a city wide survey of 301 513 citizens in 1947 disclosed that 3,850 were tubercular

Similar experiences were reported from Sacramento Calif Watertown Mass. and from Florida where efforts are under way to x-ray the entire adult population The speakers emphasized that the surveys are only a screening process and must [illegible] who cannot be reached in any other way achieve a measure of adjustment through this form of therapy As practiced in the state hospitals it includes such pursuits as handicrafts and habit training.

Manual on Multiple Sclerosis Distributed to Physicians

APPROXIMATELY 76 000 physicians in the United States have recently received a manual of information on the diagnosis and treatment of multiple sclerosis prepared by the Medical Advisory Board of the National Multiple Sclerosis Society

In this 16-page manual criteria are set up for a uniform standard of diagnosing multiple sclerosis a chronic disease of the central nervous system which is now considered by many medical authorities to be the major neurologic problem of the present [illegible] the Public Health Service will undertake funds made available by the National Mental Health Act, the report says. The requests for trained personnel however especially for psychiatrists with clinic experience have not been met, primarily because clinics cannot compete financially with private practice.

Developments in research in dementia praecox and psychosomatic medicine, directed by the committee are outlined in the report. Under the supervision of Dr Nolan D C Lewis, director of the division of psychiatric research studies are being made at the Henry Phipps Psychiatric Clinic Johns Hopkins

names. No extensive survey of the actual incidence of MS in this country has ever been made, and the present need for knowledge as to prevalence will be filled to a great extent, it is believed if physicians provide this necessary exclusively numerical data. One of the aims of the Society is to determine the prevalence of the illness as well as the influence of climatic and geographic distribution.

To that end, the National Multiple Sclerosis Society with the advice and cooperation of the [illegible] progressing toward severe mental disturbances comparisons of the incidence of dementia praecox among identical and fraternal twins, and a study of the patients' home environments.

Largely through the efforts of the national committee the report declares at least fifteen state legislatures are studying the problems of mental illness Through the organization s efforts, also an Association of Psychiatric Clinics for Children has been established its aim to instigate establishment of 700 community clinics each staffed by a psychiatrist.

NECROLOGY

Fred S Diefendorf, M D, died on May 19 at his home in Angola His age was seventy-six Dr Diefendorf was graduated from the University of Michigan Medical School in 1898 and had practiced medicine in Sharon Springs and Angola He resigned last year as health officer at Evans after serving in that position for thirty-two years Dr Diefendorf was a member of the American Medical Association and the New York State and Erie County Medical Societies

William Van Pelt Garretson, M D, of New York City, aged sixty-eight, died on June 5 Dr Garretson was graduated from the College of Physicians and Surgeons, Columbia University, in 1903 and studied at the University of Berlin in 1904 and 1905 He taught at New York Polyclinic Hospital starting as a clinical assistant and becoming professor of nervous and mental diseases He was a consulting neurologist at Harlem and Manhattan State Hospitals, New York City, Bayonne Hospital, Bayonne, New Jersey, New York State Reconstruction Home, West Haverstraw, and Lawrence Hospital, Bronxville He was also a consultant in neurology, psychiatry, and endocrinology at St Clare's Hospital, New York City Dr Garretson, a diplomate of the American Board of Psychiatry and Neurology, was a member of the New York Neurological Society, the Association for the Study of Internal Secretion, the New York Society for Clinical Psychiatry, the American Medical Association, and the New York State and County Medical Societies

Charles Bates Phillips, M D, sixty-three, di his Amsterdam home on May 11 Dr Phillips graduated from Albany Medical College in 190 had practiced in Amsterdam since that time was a surgeon on the staffs of Amsterdam City St Mary's Hospitals, Amsterdam A past presi and member of the Montgomery County Me Society, Dr Phillips was also a member of American Medical Association and the New State Medical Society

F Ward Renfrew, M D, Queens, died on Apr at the age of fifty-five Dr Renfrew was gradu from Cornell University, Medical College, in and interned at New York Hospital He se with the Army Medical Corps during the first W War Retired since 1946, Dr Renfrew had bee associate surgeon on the staffs of Downtown-E man and City Hospitals and was connected with United States Public Health Service during W War II He was a member of the American Me Association and the New York State and Co Medical Societies

Samuel Stewart, M D, died at his home in S cuse on May 15 His age was sixty-eight Stewart was graduated from the College of Physi and Surgeons, Columbia University, in 1906 and been a practicing physician in Syracuse for f years He served on the honorary staff of Cro Irving Hospital, Syracuse, and was a member o Syracuse Academy of Medicine, the Amer Medical Association, and the New York State Onondaga County Medical Societies

---

Child Safety to Be Subject for Campaign

THIS fall the Metropolitan Life Insurance Company, in cooperation with the U S Children's Bureau, the American Academy of Pediatrics, and the National Safety Council, will attempt to focus more attention on the problem of reducing accidents in the preschool age group

Because of the remarkable improvement in communicable disease mortality, accidents now constitute the leading cause of death in child one to fifteen years of age

A special packet of material on child s cluding recent statistical studies and a trated booklet for the public, will be avai Physicians who wish to have copies of t for distribution to their patients will them by the Company's field representat

Seven Hundred Surgeons of 32 Nations Meet in Rome

SEVEN hundred delegates from thirty two nations attended the sixth congress of the International College of Surgeons in Rome, Italy, in May

American Ambassador James C Dunn opened a United States Navy exhibit, "A Panorama of Military Surgery in the Second World War Guido Gonella, Italian Minister of Education, and Salvatore Rebecchini Mayor of Rome, addressed the first session.

A report on the development of a serum from human tissue that destroys or retards cancerous growth in mice was presented on the opening day of the surgeons congress by Dr Maxwell Maltz, New York City

In developing the serum Dr Maltz found two undetermined factors in the human cell, a growth factor and an antigrowth factor according to his report. He said he has identified a factor in the human cell that stops the growth of skin or other tissue when a wound is healed otherwise the cells would continue to multiply at an abnormal rate as in cancer He also identified the growth factor which makes cells multiply until a wound is closed he said

In his experiments with mice, Dr Maltz found that he could make wounds heal rapidly or slowly, depending upon the concentration of serums used containing growth and antigrowth factors.

In one serum, he used scrapings from what is known as granulation tissue. This is the rapidly growing tissue that builds up soon after a wound occurs. It prepares the way for the rebuilding of skin cells that eventually close a wound

Dr Maltz combined this serum with serum from the tissue of the spleen which, in the human body is believed to be immune to all types of cancer Other scientists have reported that it apparently contains an antigrowth factor

The combined serum was found by Dr Maltz to be effective against two types of cancer in mice

State to Increase Occupational Therapy in Mental Hospitals

DR. FREDERICK MacCURDY State Commissioner of Mental Hygiene, has announced that extension of occupational therapy to all patients who can benefit by it in the 26 mental hygiene hospitals and schools will be made possible through 209 new positions

Dr MacCurdy said this department recently completed a survey to determine the occupational therapy needs of all patients in state hospitals and schools. It was supervised by Miss Virginia Scullin, director of occupational therapy for the department and formerly in charge of that activity at Pilgrim State Hospital The survey indicated that total treatment would be improved if occupational therapy could include more patients. With additional personnel available, the treatment can be provided for several thousand more mental patients.

Dr MacCurdy said that frequently patients who cannot be reached in any other way achieve a measure of adjustment through this form of therapy As practiced in the state hospitals it includes such pursuits as handicrafts and habit training

Manual on Multiple Sclerosis Distributed to Physicians

APPROXIMATELY 76 000 physicians in the United States have recently received a manual of information on the diagnosis and treatment of multiple sclerosis prepared by the Medical Advisory Board of the National Multiple Sclerosis Society

In this 16-page manual criteria are set up for a uniform standard of diagnosing multiple sclerosis, a chronic disease of the central nervous system which is now considered by many medical authorities to be the major neurologic problem of the present day The manual also gives the newest information on rehabilitation and symptomatic treatment, as well as on treatments founded upon current theories of the disease This manual was published in full in the November 1, 1947 issue of the *Journal of the American Medical Association*.

In an effort to obtain information on the prevalence of the disease, the National Multiple Sclerosis Society is enclosing with the manual a letter to physicians asking that they inform the Society of the number of patients in their care who are multiple sclerosis sufferers without revealing their names. No extensive survey of the actual incidence of MS in this country has ever been made and the present need for knowledge as to prevalence will be filled to a great extent, it is believed, if physicians provide this necessary exclusively numerical data. One of the aims of the Society is to determine the prevalence of the illness as well as the influence of climatic and geographic distribution

To that end, the National Multiple Sclerosis Society, with the advice and cooperation of the United States Public Health Service will undertake a national survey on the prevalence of multiple sclerosis in the United States. The information now sought from physicians on the number of MS patients in their care will be valuable as an initial fact-finding effort.

It will assist the Society s statistical committee under its chairman Dr Lawrence C Kolb of the U.S. Public Health Service, in formulating its program to secure more comprehensive information through local area surveys of multiple sclerosis.

Prize Awards Announced for Scientific Exhibits at Annual Meeting

FIRST and second prize awards and honorable mentions have been announced for the scientific exhibits which were shown at the 142nd Annual Meeting of the Medical Society of the State of New York, from May 17 to 21, at the Hotel Pennsylvania, New York City

For scientific research, the first prize award was presented to Dr Gilbert Dalldorf, of the Division of Laboratories and Research, New York State Department of Health, Albany, for his exhibit, "Vaccination Against Tuberculosis with BCG Vaccine"

The second prize award was given to Dr Lee A Hadley, Syracuse, for an exhibit, "Intervertebral Foramen Studies" Honorable mention went to Drs B S Oppenheimer, A P Stout, and E T Oppenheimer, of the department of cancer research, Columbia University, College of Physicians and Surgeons, for an exhibit, "Sarcomas Induced in Rats by Implanting Cellophane"

For clinical research, Dr William Benham Snow, Columbia-Presbyterian Medical Center, received the first prize award for his exhibit, "A Program in Physical Medicine"

The second prize award was presented to Drs David Graubard, Milton H Waldman, and Raphael W Robertazzi, of the Post-Graduate Medical School and Hospital, New York City, for their exhibit, "Intravenous Procaine"

Dr Harry Wallerstein and Dr Alfred Schwartz, of Jewish Memorial, Morrisania City, and Queens General Hospitals, received honorable mention for their exhibit, "Management of Erythroblastosis Fetalis"

Space Needed for Tuberculosis Care

PROSPECTS for early addition of the large number of hospital beds needed for tuberculosis patients in the United States are poor, Dr Myron D Miller, medical officer in charge of the United States Marine Hospital, Neponsit Point, Queens, reported June 16 at the annual meeting of the National Tuberculosis Association at the Hotel Pennsylvania, New York City

Dr Miller said that only a few states meet or exceed the minimum ratio of two and a half beds for each annual tuberculosis death established in the Federal hospital survey and construction act "Hospital beds for tuberculosis patients," he said, "have not increased since the onset of war despite increased needs"

Dr Robert E Plunkett, assistant commissioner for tuberculosis in the New York State Health Department, declared that, while the state's over-all ratio is 3 2 beds for each annual death, the situation is unsatisfactory because of bed shortages in the New York City, Albany, and Buffalo areas

Encouraging results in attacking the disease in guinea pigs by administering two antitubercular drugs, streptomycin and PAS, or para-aminosalicylic-acid, were reported by Dr Robert G Bloch, of the department of medicine of the University of Chicago PAS has been found effective when used alone with human patients, and Dr Bloch expressed hope that combining it with streptomycin can bring added relief

United Medical Service Elects Officers

DR CHARLES GORDON HEYD, past-president of the American Medical Association, was elected chairman of the board of directors and president of United Medical Service at the association's annual meeting held at headquarters, 80 Lexington Avenue, New York City, it was announced recently

Dr Maximin De Mouy Touart of the Department of Laboratories and Research of Westchester County, was elected a vice-president and appointed a member of the executive committee

Dr William Brant Rawls, president-elect of the Medical Society of the County of New York, was elected a member of the board of directors Other newly elected directors are H Edward Bilkey, a trustee of Lenox Hill Hospital, New York City, and Dr John B D'Albora, Brooklyn, president of the Second District Branch of the New York State Medical Society

United Medical Service is sponsored by the Medical Society of the State of New York and 17 county medical societies

Department Sponsors In-Service Course in Public Health Nutrition

AN IN-SERVICE course in public health nutrition, sponsored by the State Department of Health and Syracuse University will be held on the university campus July 5 to 17 This institute is designed to meet the needs of health workers in the community physicians, nutritionists, public health nurses, case workers, home economics teachers, and health educators

Technics in Community Nutrition is the theme of the first week, July 5–10 The Place of Nutrition in the Public Health Program will be discussed on July 6 at a round table led by Dr Herman E Hilleboe, commissioner of health, followed by a discussion of joint planning by agencies in community nutrition programs On July 7, Dr William Darby, department of medicine, Vanderbilt University, and Dr H R Sandstead, chief of Nutrition Section of the United States Public Health Service, will discuss the present methods for determining nutritional status

How to Get the Public to Use Nutrition Information is the subject for another day's discussion. The problems and methods of group dynamics will be presented, and Dr. G. W. Larimore, director, Office of Public Health Education, New York State Health Department, will discuss the use of mass media in nutrition education. Dr. Charlotte Babcock, psychiatrist, University of Chicago will complete the first week's program with a discussion of the Psychological Factors Affecting Nutrition and Problems of Interviewing.

Selected Nutrition Problems will be presented in the second week, July 12–17. In the field of maternal and child health, Dr. Josef Warkany, department of pediatrics, University of Cincinnati, will discuss Nutrition in Pregnancy, and Dr. C. A. Smith, department of pediatrics, Harvard University, Nutrition in Infancy and Childhood. Nutrition of the Premature will be presented by Dr. F. R. Schlesinger, director, Bureau of Maternal and Child Health, New York State Department of Health, and Feeding the Infant and Child in the Home by Miss Eleanor Gochenour, consultant nurse in child health, New York State Department of Health.

The Public Health approach to Problems of Postponable Diseases will be presented by Dr. I. J. Brightman, assistant director, Division of Medical Services, New York State Department of Health, followed by a discussion of the Nutritional Genesis of Arteriosclerosis by Dr. W. C. Hueper, president, American Society for the Study of Arteriosclerosis, of New York, and the Nutritional Genesis of Liver Disorders by Dr. R. H. Lyons, professor of internal medicine, Syracuse University. Nutrition in Relation to Susceptibility to Disease will be discussed by Dr. P. A. Bunn, associate professor of internal medicine, Syracuse University, and Dr. R. L. Jackson, associate professor of pediatrics, University of Iowa, will present his work on Nutrition in the Management of Rheumatic Fever.

Nutrition in Dental Caries will be presented by Dr. David B. Ast, chief of the Dental Health Section, State Department of Health. The Future of Nutrition Research by Dr. L. A. Maynard, director of the School of Nutrition, Cornell University, and Nutrition in Work Performance by Dr. R. M. Bark, Army Medical Laboratory.

Opportunity for group participation and the presentation of actual problems for discussion will be provided for members of the institute. Additional information may be obtained by writing to the Department of Foods and Nutrition, College of Home Economics, Syracuse University, Syracuse 10, New York.

MEETINGS

PAST

Rochester Academy of Medicine

Dr. Paul W. Beaven was installed as president of the Rochester Academy of Medicine, succeeding Dr. Clarence P. Thomas, at the annual meeting held May 4 in Rochester.

Principal speaker at the meeting was Dr. Joe V. Meigs, clinical professor of gynecology at Harvard Medical School and chief gynecologist at Massachusetts General Hospital, Boston, who spoke on "Surgical Treatment of Cancer of the Cervix."

Health Council of Greater New York

Dr. I. Ogden Woodruff was re-elected president of the Health Council of Greater New York at the annual luncheon of the group held May 19 in New York City.

Dr. E. H. L. Corwin, in a paper read for him by Dr. Thomas D. Dublin, vice-president of the council, reported on the preliminary survey of the city's health needs which showed that careful scientific analysis could reduce further infant mortality.

Dr. Harry S. Mustard, New York City commissioner of health, also spoke, stressing the importance of free, voluntary health agencies. He praised the council's neighborhood organization and citizens' district health committees.

New York Psychoanalytic Society

Dr. Emanuel Klein spoke on "Psychoanalytic Aspects of School Problems" at the 307th meeting of the New York Psychoanalytic Society held May 25 in New York City. An executive session with Dr. Henry A. Bunker presiding was held.

Morgagni Society of Brooklyn

Three scientific papers were presented at the meeting of the Morgagni Society of Brooklyn held May 26 at the Kings County Medical Society Building.

The program included "Tests of Practical Value in the Diagnosis of Hepatobiliary Disease," Dr. I. Snapper, director of medical education, Mount Sinai Hospital. "Observations of Ulcerative Colitis," Dr. Albert F. R. Andresen, professor of clinical medicine, Long Island College of Medicine, and "Recent Developments in the Medical and Surgical Management of Peptic Ulcer," Dr. Everett D. Kiefer, Lahey Clinic, Boston, Massachusetts.

New York Council of Surgeons

Dr. Adolph Foti spoke on "Factors in the Mechanism of Angina Pectoris" at the meeting of the New York Council of Surgeons held June 8 at the Parkchester General Hospital, the Bronx.

FUTURE

American Association of Blood Banks

The annual meeting of the American Association of Blood Banks will be held in Buffalo, New York, August 26, 27 and 28, immediately following the meeting of the International Hematology Society there.

Organized in November 1947 at Dallas, Texas, the Association has for its purposes: to promote and foster the exchange of ideas and materials and the dissemination of information relating to blood banking; to foster and plan for cooperation in times

of disaster, to function as a clearing house, and to promote and foster and aid and encourage the extension of similar services throughout the United States and its territories

Membership is of two classes—institutional and individual Information may be obtained from Miss Marjorie Saunders, secretary, 3301 Junius Street, Dallas, Texas

American Congress of Physical Medicine

The American Congress of Physical Medicine will hold its annual scientific and clinical session from September 7 to 11 at the Hotel Statler, Washington, D C

All physical medicine sessions will be open to members of the medical profession in good standing with the American Medical Association Full information may be obtained by writing to the American Congress of Physical Medicine, 30 North Michigan Avenue, Chicago 2, Illinois

American College of Surgeons

The thirty-fourth Clinical Congress of the American College of Surgeons will be held at the Biltmore Hotel, Los Angeles, California, from October 18 to 22, 1948 The program of scientific sessions will include subjects in the fields of general surgery, eye, ear, nose, and throat surgery, gynecology and obstetrics, urology, and orthopedic, thoracic, plastic, and neurologic surgery

Supplementing this program will be operative clinics in hospitals in Los Angeles by showings of operations by television and motion pictures, and by a four-day hospital standardization conference for hospital personnel There will also be extensive technical and scientific exhibits

PERSONALITIES

Retired

Dr Linn C Beebe, health officer for the Village of Hamilton, after serving in the post since 1926 Dr Russell E Blaisdell, as superintendent of the Rockland State Hospital Dr J R Schermerhorn, as director of the Schenectady County venereal disease clinic, a position he has held since the program started in 1935

Honored

Dr Earl H King, Saratoga, by the Saratoga Springs Medical Society, in honor of his fifty years in the practice of medicine, at a dinner on April 29 Dr Joseph M Purcell, recently cited by the Medical Society of the State of New York for fifty years in practice, an honorary life membership from the Foresters of America, conferred for his services to the order in Mechanicville

Awarded

Dr Alan Weyl Bernheimer, New York University College of Medicine, a medal and a $1,000 honorarium for an outstanding contribution in the field of bacteriology, the annual Eli Lilly Award presented by the Society of American Bacteriologists May 12 in Minneapolis

Dr Goodwin M Breinin and Dr Walter J Maher, New York City, winners of the third annual New York City Lions Club scholarships for graduate training in ophthalmology Dr John F Erdmann, New York City, the honorary degree of Doctor of Science at New York University's 116th commencement exercises on June 9

Lieutenant Colonel Paul S Roland, formerly of New York City, who was taken prisoner in Bataan in 1942 while stationed at the Second General Hospital there as surgeon, a certificate of award from the National Government, Republic of China, the Special Breast Order of Cloud and Banner with Certificate, signed by Chiang Chung-Cheng, president

Dr Isidor Rubin, at the annual meeting of the American Gynecological Society, May 25, at Williamsburg, Virginia, a check for $1,000 for an outstanding contribution in obstetrics and gynecology produced during 1947, in recognition of his book, "Uterotubal Insufflation" Dr George Gray Ward, New York City, the Alumni Medallion for Distinguished Service to American Medicine, at the ninetieth commencement exercises of the Long Island College of Medicine, held June 10 in Brooklyn

Appointed

Dr Charles E Dutchess, Schenley Laboratories, New York City, Dr J B Rice, Winthrop-Stearns, New York City, Dr Stanton M Hardy, Lederle Laboratories, Pearl River, and Dr D K Kitchen, Bristol Laboratories, Syracuse, as members of the board of the medical section of the American Pharmaceutical Manufacturers' Association

Dr Jefferson Browder, as director of the department of surgery of the Long Island College Hospital, effective July 1 Dr Duncan W Clark, as new dean of the Long Island College of Medicine, succeeding Dr Jean A Curran, now president of the College Dr Hans Kraus, as assistant professor of clinical rehabilitation, New York University College of Medicine Dr Robert B MacLeod, as professor and chairman of the department of psychology, Cornell University

Elected

Dr Henry W Ferris, director of the Tompkins County Laboratories at Ithaca, as president of the New York State Association of Public Health Laboratories, succeeding Dr Theodore J Curphey

Dr James L McCartney, president of the new Nassau Neuropsychiatric Society, to be aided by Dr C Milton Meeks as vice-president, and Dr Peter G Denker as secretary-treasurer Dr Frederick N Marty, Syracuse University, to the executive council of the American Student Health Association

Speakers

Dr Anthony Bassler, New York City, on "The Etiology and Treatment of Ulcerative Colitis" at the annual convention of the Rhode Island Medical Society on May 13 Dr Henry Fineberg, superintendent of Queens General Hospital, at the meeting of the Queens Council for Social Welfare

Dr Foster Kennedy, director of the neurological service of Bellevue Hospital, on "Education Throughout Life," at the annual meeting, June 24, of the New York Welfare Council's Conference Group on Welfare of the Aged Dr V A. Van

Volkenburgh, assistant commissioner for local health administration, New York State Department of Health on "Interpreting Public Health Service to the Public" at the Massachusetts Public Health Conference and New England Health Institute at Amherst June 18.

New Offices

Dr P James English formerly of Cohocton general practice in Naples Dr William L Gates, former captain Army Medical Corps general practice in Cazenovia Dr Ward S. Jenkins, formerly on staff of the Glens Falls Hospital, general practice in Salem Dr Robert R. Kennedy Brooklyn general practice in Sag Harbor Dr L. H Kertzner formerly on staff of Morristown General Hospital Morristown New Jersey, as a member of the Hampton Clinic, Hampton Bays

Dr Curtis Lacy Freehold recently chief of the department of dermatology and allergy, U S Veterans Hospital, Vancouver, Washington general practice in Catskill Dr Nicholas T Lombardi reopened his office for general practice in Amsterdam Dr M Edward Miller formerly of Roscoe general practice in Jeffersonville Dr William K Major, recently discharged from the Army after serving at a base hospital in Oregon and on a troop transport general practice in Waterloo

Dr Carl P Sherwin Scarsdale formerly resident physician at Bellevue Hospital New York City general practice in Malone Dr John R. Roberts, former captain in Army Medical Corps at Fort Benning Station Hospital, general practice in Kingston

FELLOWSHIPS ON PATHOLOGY OF TUMORS

Through the W T Grant Foundation, fellowships on the pathology of tumors are available in the laboratories of Memorial Hospital for the Treatment of Cancer and Allied Diseases, New York City Requirements are that a candidate shall hold appointment as assistant professor or instructor in a university department of pathology and that he shall be given a one-year leave of absence with a guarantee that he may return to academic status after completion of the fellowship These fellowships are designed for training of personnel of universities which have received government grants for establishment of correlated work in the teaching of cancerology Students will have access to about 18,000 specimens per year and will attend conferences and follow-up clinics Research may be undertaken as a minor portion of the program, provided it forms a part of one of the research programs being conducted in the institution The annual stipend of $5,000 may be supplemented by the university in any individuals case.

Application should be made to Dr Fred W Stewart Memorial Hospital 444 East Sixty Eighth Street New York City 21

NUMBERED BABIES DUE NEXT YEAR

Newborn American babies will be assigned serial numbers in a national system getting under way the first of next year, the Public Health Service announces All U.S numbers will start with 1 all Canadian numbers with 2. Following that numeral will be two indicating the state—*e g*, 01 for Alabama 48 for Wyoming. These are followed by a dash and by two numbers to indicate the year Finally in a six digit set, comes the baby's number Thus, the first 1949 infant in Alabama will be assigned 101-49-000001 Wyoming's will get 148-49-000001 —*Medical Economics June 1948*

THIRD WORLD CONGRESS ON MENTAL HEALTH

The Third World Congress on Mental Health will be held in London from August 11 to 21 1948 It is expected to attract some 3,000 people from over 50 countries. The difficulties of reaching this country may be eased by the active support promised by UNESCO and WHO The congress will embody international conferences on child psychiatry and medical psychotherapy (Aug. 12–18) and on mental hygiene (Aug 16–21) The themes will be in the first conference, foundations of mental health in childhood in the second guilt and in the third mental health and world citizenship The congress committee headed by Dr J R. Rees, is exerting itself to ensure that the communications on this last topic shall represent all shades of opinion in each country Sociologists psychologists, educationists and others are being invited to participate and already discussion groups or preparatory commissions have been set up in this country and in North America to synthesize different individual views

The work of these commissions is coordinated from London by means of a monthly digest of activity in all countries The organizers hope is that international comparison will lead to a clearer understanding of the social relationships bearing on the well-being of the individual and of society Information may be had from the congress office at 39, Queen Anne Street London, W 1

HOSPITAL NEWS

Hospital Departments of "Home Care" to Be Started by Fall

HOSPITAL Commissioner Edward M Bernecker announced in May that he hopes to have the "departments of home care" planned for fourteen municipal hospitals in operation by this fall

An advisory committee will be appointed shortly, Dr Bernecker said, to expedite the Hospital Department's plans to install home care services with $1,368,750 of the $4,000,000 in extra funds to be made available to the department July 1 by the recently announced increase in municipal transit fares The development of home care services is intended to cut down the present overcrowding of hospitals

Dr Bernecker said that the advisory committee will include representatives of the Academy of Medicine, the County Medical Societies of New York City's five counties, visiting nurses services, the Hospital Council of Greater New York, the Health and Welfare Departments, and individuals who have pioneered in home care

Hospital Practice by Groups Urged at Institute

GROUP practice centered in hospitals offers the best of modern medicine to the American public, Dr Dean A. Clark, medical director of the Health Insurance Plan of Greater New York, told 100 hospital administrators at the opening, on June 14, of a two-week institute at Columbia University's School of Public Health, New York City

Chief obstacles to its attainment are psychologic, professional, and economic, Dr Clark contended, and three major problems are involved First, he said, was a "break" with the voluntary hospital tradition that limits services for ambulant patients to persons of low income Second, "unfair" competition in medical practice will be offered by the group if the hospital subsidizes its establishment or operations Third, payment must be received for the medical group's services to ambulant and "at home" patients

Dr E H L Corwin, executive secretary of the New York Academy of Medicine's committee on public health relations, urged cooperative efforts to preserve voluntary hospitals

He held that 30 per cent of operating cost deficits should be made up by the community and that the hospital's share from tax funds should be increased Seventy per cent of a hospital's operating expense is covered by patients' fees, he noted, and a community can help also by participating in prepayment plans Meanwhile, he cautioned, hospitals must reduce waste and costs

Other speakers included Dr Claude W Munger, director of St Luke's Hospital, Dr Edgar C Hayhow, president of the American College of Hospital Administrators, and Dr Morris Hinenburg, executive director of the Jewish Hospital, Brooklyn

The institute is sponsored by the American College in cooperation with the Columbia Faculty of Medicine, the State Hospital Association, and the Greater New York Hospital Association Among the problems to be considered by the institute are State, city, and rural programs for hospital expansion, rehabilitation as a function of the general hospital, clinical programs in the treatment of poliomyelitis, and cancer research centers

Rochester's Hospitals Operate Close to Capacity

HEAVY admittances continue to keep Rochester's six voluntary hospitals running at a near-capacity rate with little indication of a letup, according to a recent report from hospital directors

They reported in May that figures for April kept pace with March statistics and in some instances exceeded them, with maternity admittances generally heavy and with medical, surgical, and pediatric departments running full Emergencies were also being handled at a near-capacity rate

While in March many elective admissions for surgery or observation were either canceled or postponed due to the lack of available beds, this situation apparently eased somewhat in April However, the traditional season for tonsil removal has now arrived and at least one hospital reported reservations for tonsil operations have been made as far ahead as July

Here is the current situation, by hospitals

Highland—Admissions have dropped off slightly from March, with extra beds in use then no longer needed Departments are still running at capacity *General*— Maternity admissions were up in April, medical and surgical departments were running 100 per cent of capacity General over-all admittances were 96½ per cent of capacity, against 91 per cent in March

Genesee—Running about 90 per cent of capacity, with maternity admittances fairly light, emergencies heavy, pediatrics at capacity *Strong*—Running 100 per cent of capacity in all departments *St Mary's*—Recorded 1,330 admissions in April for 11,011 days of hospital care Admissions averaged 44⅓ daily, higher than in March. Occupancy was more than 100 per cent of capacity

Park Avenue—April admissions ran 101 per cent of capacity as against 88 per cent in March Maternity ran 104 per cent

New Referral Form Created for Hospital, Physicians, and Public Health Agencies

A MEANS for more effective referrals between hospitals private physicians, and public health nursing agencies has been announced by the United Hospital Fund of New York in the revision of the Greater New York inter-agency referral form. This method of referral has created nation wide interest as evidenced by inquiries from medical and nursing agencies in fifteen states since January 1

The new method and form, which began several years ago in a project undertaken jointly by the Medical Social Work Committee of the Brooklyn Council for Social Planning the staff of the Visiting Nurse Association and a United Hospital Fund Social Service Consultant, is thought to be the only community wide, uniform referral system now in use in the country's health and welfare agencies. This referral system is used by the majority of the large voluntary hospitals and has recently been adopted by Commissioner Edward M Bernecker for municipal hospitals. It is being used increasingly by private physicians for their office patients to insure proper follow up care in the home.

Public health nursing agencies in Greater New York which are cooperating in use of the form are The Association for the Aid of Crippled Children, New York City Department of Health Bureau of Nursing Visiting Nurse Associations of Brooklyn and Staten Island Visiting Nurse Service of New York, and the Community Service Society Nursing Department.

The form is designed to promote constructive use of auxiliary services for the patient s social as well as physical rehabilitation A continuation sheet provides means for continuing interchange of information between agencies The form takes into consideration all possible services by various medical professions for the patient the physician hospital nurse, physical therapist occupational therapist dietitian medical social worker, public health nurse and others concerned with planning the patient s continuing care The Executive Committee, formed from representatives of the professions in Public Health Nursing Agencies and hospitals believes the form will be a means for projecting hospital thinking to problems which may arise from home care.

Bellevue Opens a ' Pilot Plant for Rehabilitation Work in U.S

THE New York University Bellevue Medical Center's Institute of Rehabilitation and Physical Medicine was formally opened June 17 at its interim quarters in New York City

Described as a pilot plant for other rehabilitation activities in the United States, the institute for the first time integrates training of physicians and technicians in rehabilitation research in the field, and treatment and training of handicapped persons. The four-story building, once a public bath and later a City Welfare Department station will house the institute until completion of the medical center in 1950

Bernard M Baruch, a speaker at the opening, said ' I know of nothing more intriguing or worthwhile than this institute. It holds our hope that those who enter here will be enriched in body, soul and spirit.' Other speakers were Dr Harry Wood burn Chase chancellor of N Y U and General William J Donovan, wartime director of the Office of Strategic Services. Dr Howard A. Rusk, director of the institute presided

Neurological Institute Presents Program on Chemotherapeutic Treatment of Poliomyelitis

THE Neurological Institute of New York is planning a program of treatment of poliomyelitis by chemotherapy, according to an announcement by Dr Edwin G Zabriski, acting director

The institute is desirous of obtaining very early cases. If such cases are noted by physicians, immediate notification by telephone may be made so that the patients may be transferred if directed to the Neurological Institute at once Telephone Wadsworth 3-2500, Extension 7636.

There is a limited supply of funds to be applied to patients unable to afford routine ward expenses.

Institutes on Diarrhea of the Newborn

IN ORDER to help hospitals plan their program for the control of diarrheal diseases in newborn infants, one-day institutes are being held by the State Medical Society and the State Department of Health in each of the eleven State Medical Society regions (exclusive of New York City) Representatives from each of the 272 upstate hospitals maternity homes, and child care institutions have been invited to participate in these meetings.

The program for each institute includes a discussion of diagnosis and treatment, the epidemiologic basis for the new Regulation 35 (precautions to be observed for the control of diarrhea of the newborn) simplification of nursery technics, and hospital administration in relation to the control of diarrhea of the newborn

Following the formal program a question-answer period allows hospitals to present their problems for discussion, and suggestions as to their solution are discussed by the participants.

Nursing Schools of Greater New York Listed by Hospital Association

THE Greater New York Hospital Association, representing 98 voluntary nonprofit hospitals and 22 municipal hospitals, in collaboration with Associated Hospital Service—New York's Blue Cross Plan—has published a complete list of the 36 registered and 9 practical nursing schools in the metropolitan area, Miss Helen Hayes, chairman of the Citizens' Committee on Hospital Careers, announced in June

Young men and women interested in the nursing profession and other hospital careers may obtain a copy by writing or phoning to the Greater New York Hospital Association, 72 Wall Street, New York City 5, DIgby 4-5570, or at their local hospital

The third in a series of lectures for the Institute of Metabolism and Nutrition was given at the Doctors' Hospital of Queens, Jamaica, Long Island, by Dr Charles L Fox, Jr, on June 17 Dr Fox, professor of bacteriology at the College of Physicians and Surgeons, Columbia University, spoke on "Electrolyte Therapy in Medicine and Surgery"

Broadacres Sanatorium, Utica, has been transferred from Oneida County to New York State, Dr Herman E Hilleboe, State Commissioner of Health, announced in June Used primarily for the treatment of tuberculosis, the sanatorium will be expanded under State operation, Dr Hilleboe said, particularly in the field of clinic services in the county The hospital has 182 beds and a staff of 100 Dr William C Jensen is expected to continue as superintendent

In 1947 a total of 8,477 women and babies received 79,148 days' care at the Woman's Hospital, New York City, according to the annual report of F Huntington Babcock, president of the hospital Fifty per cent of this number constituted ward service

At the meeting of the staff of Highland Hospital, Beacon, on May 3, Dr Ralph Hall, Cold Spring, spoke on "The Hospital and the Community" His speech was illustrated by two films, "As Others See Us" and "You're the Doctor"

There were 146 patients cared for at St Andrews Convalescent Hospital, New York City, in 1947, according to the sixtieth annual report of the hospital The number of hospital days was 4,454, with 1,826 being free hospital days

The twenty-third annual convention of the Hospital Association of New York State was held on May 26, 27, and 28, at the Olympic Arena, Lake Placid Executive secretary of the association is Carl P Wright of the Syracuse General Hospital Other officers are Dr Morris Hinenburg, Brooklyn Jewish Hospital, president, Lawrence E Kresge, Auburn City Hospital, president-elect, and Moir P Tanner, Buffalo Children's Hospital, treasurer

A dinner meeting of the Vassar Brothers Hospital Association, Poughkeepsie, was held on May 12, with association directors, hospital trustees, department heads, members of the executive committee of the Woman's Auxiliary, and presidents of the men's service clubs in the city, attending Brief talks were given by Robert Hoe, president of the board of trustees, Mrs Henry Muller, president of the Woman's Auxiliary, Dr Emil A Stoller, vice-president of the medical staff, and Ellison H Capers, administrator

A movie, "Managing Wounds of Violence," was shown at the monthly meeting of the medical staff of Mercy General Hospital, Tupper Lake, on April 30

Tumor detection clinics will be operated at the Cornwall Hospital, Cornwall, every Wednesday at 7 P M, and in the Horton Memorial Hospital, Middletown, every Monday evening at 7 P M, according to an announcement by Dr H F Pohlmann, Middletown Both clinics have been approved by the Medical Society of Orange County These clinics are for persons without symptoms who will be given complete physical examinations, including chest x-rays and essential laboratory work

At the regular meeting of the staff of St Francis Hospital, Poughkeepsie, on May 3, Dr F A Gagan presented six cases of intestinal obstruction, three of which were due to carcinoma, two were on the basis of strangulation at hernial orifices, and one a mesenteric thrombosis Deaths of the month were discussed and autopsies presented

The Veterans Administration announced in June that all ten of its hospitals in New York State had been approved by the American Medical Association and the American Hospital Association Nine have been approved, one has applied for approval by the American College of Surgeons, and seven have been approved for the training of resident physicians in medical specialties

Dr Norman R. Treves associate attending surgeon of Memorial Hospital, spoke on clinical aspects of cancer at a meeting for installation of officers of the Dora Paul Fund for Cancer Research at the hospital New York City, on June 16 The meeting also marked the second anniversary of association of the Dora Paul Fund with Memorial Hospital

St. Francis Hospital Port Jervis, admitted 2,206 persons for treatment during 1947 Included were 359 maternity cases 806 operations and 232 blood transfusions.

Dr Joseph H Globus assistant clinical professor College of Physicians and Surgeons, Columbia University and consulting neurologist and neuropathologist of Mount Sinai Hospital New York City, was guest speaker at the Dutchess County Psychiatric Society meeting, held in April at Harlem Valley State Hospital, Wingdale His subject was "Cerebrovascular Accidents'

Brooklyn s hospital problems were reviewed at a forum meeting in May, attended by lay and professional community leaders Leading the forum sessions were Dr Edward F Falsey associate professor of clinical psychiatry at the Long Island College of Medicine and chief of the William Alanson White Clinic who spoke on the Role of Psychiatric Education in the Treatment and Rehabilitation of the Medically Ill Patient Dr Paul Eger of the department of home care at Montefiore Hospital, who spoke on Montefiore Hospital Home Care Program and Dr Donald A Covalt associate professor of rehabilitation at New York University College of Medicine who discussed the 'Third Phase of Medicine.'

The bed capacity at Lawrence Hospital, Bronxville, will be increased from its present total of 104 to 162 by late 1949, if present plans are carried out on schedule The increase will be made possible by the addition of, a six-story adjunct to the present plant which will be called the Community Memorial Building of Lawrence Hospital

A three-story connecting corridor between the present Administration Building and the new building will reconcile floor levels and will make possible better elevator service for patients and visitors. Included in the new building will be three large operating rooms and a room for minor operations, a cystoscopic room, two new delivery rooms, two nurseries a doctors lounge a large central supply room a staff dining room a combined chapel library and conference room and an autopsy room

Special ceremonies and 'open house programs in observance of National Hospital Day were held in May by Staten Island s three voluntary hospitals Hospital employes staffs and members of volunteer hospital groups joined in staging the events Two of the institutions St Vincent s and Richmond Memorial held tree-planting ceremonies at which trees were dedicated to former hospital benefactors 'Open house was held at St Vincent s and Staten Island hospitals

Last year 5,887 were admitted to the Children s Hospital Buffalo for medical care The outpatient department treating children who are not confined to the hospital but come to the hospital for medical care recorded 40 222 visits by children whose families could not afford medical treatment Every child has access to the many outstanding clinics at Childrens Hospital designed and staffed especially for children These include child guidance cerebral palsy electroencephalography for the diagnosis of brain injuries, brain diseases and epilepsy radiology urology skin heart eye ear bone, neurology and dental clinics Other special services include x ray, occupational therapy, rehabilitation physical therapy, bacteriology pathology and research

The next clinico-x ray conference at St Agnes Hospital, White Plains, will be held on October 7 These conferences are open to the profession and have as their objective the discussion of interesting cases some brought in from outside others originating in the hospital Conferences are held on alternate Thursdays from 4·00 to 5·00 P M throughout *the academic year*

The Cortland County Hospital and the Nurses Home Cortland were visited by approximately 1 000 people in observance of National Hospital Day Of especial interest to the majority of the visitors was the new formula room with its equipment for terminal sterilization for all infant formulas and the kitchen

A new pathology laboratory was opened at the Caledonian Hospital Brooklyn, in May It has all modern equipment for the rapid diagnosis of cancer Dr Edmund Marino pathologist of the hospital is director of the laboratory

A newly enlarged and renovated Moses Ludington Hospital Ticonderoga was opened to the public in May The hospital now has 80 beds and all ultramodern facilities

Dobbs Ferry Hospital reports that the number of patients treated daily in the hospital in 1947 was 35 which was a daily increase of two over the previous year The total of major and minor operations was 443, an increase of 25 over 1946, and the number of babies born in 1947 was exactly 200 an increase of 27 over 1946 A total of 212 ambulance calls were answered.

An Institute for the study of medical subjects was held under the auspices of the New York State Medical Society and New York State Health Depart

ment recently at Saranac Lake Representatives from hospitals in three counties, St Lawrence, Jefferson, and Franklin, were present

The two sessions were under the chairmanship of Dr Sidney Mitchell, north regional chairman for pediatrics Speakers for the morning session included Dr Samuel L Pettit, assistant pediatrician at Physicians' Hospital and Champlain Valley Hospital, Plattsburgh, and Dr Ray E Russell, epidemiologist, Bureau of Communicable Disease Control, New York State Department of Health

Buffalo General Hospital has received a grant of $1,881 04 from the New York State Division of the American Cancer Society for the establishment of a cytologic diagnostic laboratory service The grant will be used to purchase necessary equipment and to pay a technician's salary for six months The laboratory will be under the direction of Dr Clyde L Randall and Dr Kornel L Terplan, assisted by Dr Donald Hall and Dr Herbert Eccleston It is believed to be the only one of its kind in Buffalo The service will be made available for any doctor who wishes to use it

•

A total of 1,799 patients was admitted for treatment at Cohoes Hospital during 1947, according to a report prepared by Miss Elizabeth Lautermilch, hospital superintendent The report sets the total number of patients discharged from the hospital last year at 1,787 During the year 359 babies were born at the local institution, and 74 persons died there A total of 553 operations were performed at the hospital during the past year The report shows 200 major operations, 158 minor, and 173 for the removal of tonsils and adenoids

•

An endowment fund in memory of Dr Emily Lewi has been given to New York Infirmary, New York City, by friends of Dr Lewi. Income from the fund will be used for the care of ailing women physicians connected with the infirmary and their children Dr Lewi, who died two years ago, was a pediatrician who practiced more than fifty years and served as director of pediatrics at the infirmary from 1930 to 1936 She was known as an outstanding teacher and diagnostician and was one of the pioneers in endocrinology

Dr John Garlock, attending surgeon, Mount Sinai Hospital, New York City, read a paper on "Carcinoma of the Gastrointestinal Tract" at the staff conference meeting of Boulevard Hospital, Long Island City, on May 27

•

"Open house" was held at the North Country Community Hospital, Glen Cove, in May in order to show the people of the North Shore area how a large hospital operates, how diverse are its problems, and how immense its responsibilities Last year the hospital served 4,500 patients

Our Lady of Lourdes Memorial Hospital, Binghamton, is making a survey of 8,000 Triple City residents to gather opinion on the extent that the hospital should be expanded The survey is being conducted by a Community Relations Committee, of which John D Ross is chairman and which was appointed by the hospital's advisory board

Corinth Hospital has been equipped recently with x-ray and basal metabolism machines, Mrs Florence T Schermerhorn, supervisor, has announced The machines were donated by Dr Cecil Rogers, of Hadley, for the use of the hospital patients

•

The board of directors of Olean General Hospital released statistics recently showing that the number of patients served has nearly doubled since 1940 The figures show that during 1940 the hospital served an average of 51 57 patients per day, and last year the average jumped to 91 32 patients per day While the number of beds and bassinets has remained at 109, in the years between 1940 and 1947 the total number of patients admitted annually has risen from 2,036 to 3,520 Emergency room cases have increased from 145 to 415, medical cases from 418 to 877, obstetric cases from 351 to 743, and babies cared for at the hospital from 328 to 864

•

The equipment of Flushing Hospital, Queens, was demonstrated, and the five floors of the hospital were shown to thousands of visitors in observance of National Hospital Day in May A corps of volunteers conducted the inspection while staff members explained the work of various departments

ASKS "GOOD NEIGHBOR" MEDICAL SCHOOL

The U S should establish an international medical school as an effective demonstration of the "good neighbor policy," Dr Merl G Colvin of Williamsport, Pennsylvania, has told the A M A. He points out that medical missionaries like Schweitzer and Seagrave have done remarkable work but have had no means of perpetuating it Bring native young men and women to this country, says Doctor Colvin, and train them for work in their own lands Then, he said, the medical centers established by missionaries will thrive and expand —*Medical Economics, May 1948*

WORM DISEASE CAUSES FITS LIKE THOSE IN EPILEPSY

A worm disease that can cause fits like those in epilepsy and which may be mistaken for epilepsy or some mental trouble was reported by Lieut Col W H Hargreaves, medical liaison officer of the British Joint Services Mission, to the International Congress of Tropical Medicine and Malaria meeting in Washington

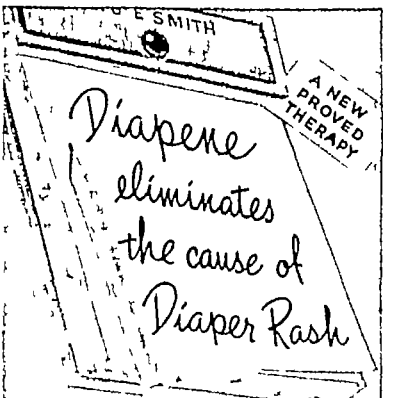
The disease is called cysticercosis and is caused by the larval form of pork tapeworm When the larvae get into the body they are surrounded in time by calcium These hard lumps or cysts may be found anywhere in the body They can sometimes be seen under the skin When they get in the brain they may cause fits

The condition may occur here in the United States or in any other country where pork tapeworms are found Col Hargreaves said He and Dr H B F Dixon screened every British Army veteran reported to have fits and found more than 300 of them had worm cysts in their brains Most of the men had seen service in India and apparently picked up the worm larvae there through contaminated food or drink

Individual worm cysts can often be located with x-rays and removed, even from the brain But since there are usually many of the cysts, this treatment is not very practical Some patients who were going blind because of the cysts were helped by a decompression operation

The disease has a low death rate, 8 per cent, and very few of the surviving patients show any signs of the disease getting worse More than a third are improving, and one-sixth, approximately, have recovered.—*Science News Letter, May 22, 1948*

SCHOOLS



Does Your Medical Assistant Need Additional Training?
EVENING COURSES IN LAB & X-RAY AVAILABLE
Our 12-months day course includes intensive training in laboratory techniques, physiotherapy apparatus, X-Ray nursing techniques, and medical stenography
A FEW LAB TECHNICIANS NOW AVAILABLE

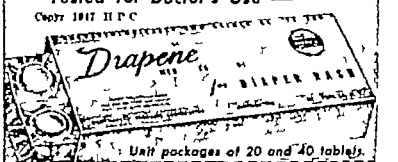
"MEDICATES THE DIAPER"



The cause of *ammonia dermatitis* is ammonia liberated by bacterial de composition of urinary urea DIAPENE — impregnated into the laundered diaper merely by rinsing — checks the particular bacillus which releases am monia from the baby s urine DIAPENE therefore, prevents and relieves diaper rash by elliminating the cause

IMPORTANT—DIAPENE is as basically necessary as baby oil powder or ointment, because chafing prickly heat, *allergy rashes*, etc are often aggravated by ammoniacal urine DIAPENE is a prophylactic MUST for every baby!

For prevention, medicate only night diapers
For treatment medicate all the diapers
One tablet to 2 qts water a rinse for 6 diapers

Bacteriologically and Clinically Tested for Doctor s Use —

Copyr 1947 H P C

Unit packages of 20 and 40 tablets

HOMEMAKERS PRODUCTS CORPORATION 380 Second Ave. New York 10, N Y

Please send me without cost literature and samples of DIAPENE to eliminate cause of diaper rash (*ammonia dermatitis*)

REVIEWED

Methods of Diagnosis By Logan Clendening, M D, and Edward H Hashinger, M D Octavo of 868 pages, illustrated St Louis, C V Mosby Co, 1947 $12 50

Methods of Diagnosis by the late Dr Clendening was brought out after his death by his coworker, Dr Edward H Hashinger It is excellently written by a master clinician in direct, colorful language The first part of 76 pages deals with a discussion of logic in diagnosis and is worth the price of the book Parts 2 and 3 are of great value in the appreciation of history and physical examination Part 4 deals with laboratory and special procedures, which include usual simple laboratory tests and their value together with excellent discussions of x-ray diagnosis, electrocardiogram, basal metabolism, and instrumental examination of the eye, ear, larynx, bronchus, esophagus, lower bowel, and stomach The book is well printed, easy to read, and contains an excellent index It can be highly recommended to medical students and to general practitioners

MEYER A RABINOWITZ

Sex Education A Guide for Parents, Teachers and Youth Leaders By Cyril Bibby, M Sc Duodecimo of 311 pages New York, Emerson Books, 1946 Cloth, $2 50

This is an excellent treatise on child guidance from an early age to and after marriage It tells of the pitfalls which assail the growing child in his acquisition of sex and health knowledge There has been in past years too much of a hush policy in dealing with the facts of life, but *Sex Education* gives a clear idea as to how to deal with the instruction of developing youth This book is not for casual readers but is a textbook for students of medicine, social workers, school teachers, both lay and religious

ARTHUR D JAQUES

Heparin in the Treatment of Thrombosis An Account of Its Chemistry, Physiology and Application in Medicine By J Erik Jorpes, M D Second Edition Octavo of 260 pages, illustrated, New York, Oxford University Press, 1946 Cloth, $6 50

This is the second edition of an excellent monograph on chemistry, physiology, and clinical applications of heparin The author, a pioneer investigator of heparin, has expanded on the first edition, both by bringing it up to date and by widening the discussion, particularly of clinical problems The style is clear, the bibliography is well chosen

ARTHUR SHAPIRO

What Is Heart Disease A Handbook for the Heart Patient. By William Hyatt Gordon, M D Duodecimo of 114 pages, illustrated New York Grune & Stratton, 1946 Cloth, $2 50

This excellent book for the layman is written, not to supplant attending physicians' advice, but to make patient and doctor find a common meeting ground The sample diet lists should not be in the book, as they may tend to have the patient follow the diet without consulting his doctor

On the whole, the book is well written and easy to understand The section on diseases of the coronary arteries is perhaps the best The author explains the physiologic reasons for the doctor's orders in coronary heart diseases There is a fine chapter on symptoms erroneously thought to indicate heart diseases The author stresses the fact that murmurs of themselves are never of any importance, for they are simply noises

Except for the chapter on diets, this book is recommended for the layman

VINCENT ANNUNZIATA

Massage and Remedial Exercises. In Medical and Surgical Conditions By Noel M Tidy Seventh edition Octavo of 480 pages, illustrated Baltimore, Williams & Wilkins Co, 1947 Cloth, $6 00

This well-written work should prove helpful to nursing personnel and other technical physical medical aides, both as a text and a reference Some physicians might consider it too elementary for their uses, nevertheless this reviewer recommends it as a valuable and excellent book even for their perusal

MEAT

And the Dietary of Pregnancy and Lactation

According to a study published in the recent past[1] it has been shown that nitrogen balance is suddenly reversed from positive to negative shortly before term This negative balance is further intensified by substantial losses of nitrogen during parturition and the postpartum period Lactation imposes still another burden on nitrogen metabolism

This study again emphasizes the need for a diet rich in biologically complete protein during the latter half of pregnancy In this manner, the physiologic loss of nitrogen at term can be compensated, avoiding negative nitrogen balance A high protein diet has the further advantage of producing a more copious milk supply .

In another recent publication,[2] the prevention of the toxemias of pregnancy by dietary means was stressed Foremost among the measures recommended was a diet rich in high quality protein to assure nitrogen balance

Meat is an outstanding source of protein in the dietary of pregnancy and lactation for these four reasons (1) It is notably rich in protein, from 17 to 20 per cent of its uncooked, and from 25 to 30 per cent of its cooked weight, (2) The protein of meat, regardless of cut or kind, is biologically complete, (3) The appetite appeal of meat is high, and (4) All meat is of excellent digestibility—from 96 to 98 per cent

1 Stuart, H C. Effects of Protein Deficiency on the Pregnant Woman and Fetus and on the Infant and Child, New England J Med 236 507 (Apr 3) 1947

2 Zeigler, R F , Jr Pre eclamptic Toxemia of Pregnancy North Carolina M J 8 655 (Oct) 1947

"Over Forty-five Years devoted to pleasing particular people"

Candy AND CHANGING Energy REQUIREMENTS

THE widely varying demands imposed upon the organism by physical activity cannot always be met by even a well-balanced dietary, since food requirements are based on average daily needs

Following periods of strenuous physical activity in play, games or work, when the usual stores of carbohydrate energy may become temporarily depleted, both children and adults find pleasure in turning to candy as a source of quickly available food energy Not only are the metabolic demands met by the easily digested, quickly utilized nutrients in candy, but appetite is also momentarily appeased

FURTHERMORE, candies containing milk, butter, eggs, fruits or nuts contribute most pleasingly their proportionate measure of the essential nutrients contained in the foods of which they are made At other times, when energy demands are less excessive, candies are also welcome, affording a pleasing and gratifying finishing touch to round out the meal just eaten

Council on Candy of the NATIONAL CONFECTIONERS ASSOCIATION

Experience is the Best Teacher

William Withey Gull
(1816 1890)
proved it in pathology

SIR William Gull is medically recognized for his many original observations which led to his classic description of myxedema and a greater understanding of nephritis. He also added much to the fundamental knowledge of neuropathology—such as his observations that locomotor ataxia was a disease of the posterior columns of the spinal cord. Medical knowledge was greatly enriched by Gull's experiences.

Experience is the best teacher in cigarettes, too!

Yes, Experience is what counts—just as always has. And with millions of smokers who have tried and compared many different brands of cigarettes, Camel is the 'choice of experience."

Try Camels! Discover for yourself how the rich full flavor of Camel's choice, properly aged and expertly blended tobaccos pleases your taste. See if Camel's cool cool mildness isn't mighty welcome to your throat.

Let your own experience tell you why *more people are smoking Camels than ever before.*

R. J. Reynolds Tobacco Co.
Winston-Salem, N. C.

According to a Nationwide survey:

More Doctors Smoke CAMELS

than any other cigarette

Three independent research organization in a nationwide survey asked 113,597

ESTIVIN

Intraocular means of treating HAY FEVER

Prompt, safe symptomatic relief of the distressing hay fever symptoms—sneezing, nasal discharge, eye itching, lacrimation, etc—is effectively secured by Estivin

One drop in each eye upon arising, one before breakfast, and one after breakfast, will usually keep the sufferer comfortable well into the morning Estivin does not cause drowsiness, or depression, thus permitting application whenever indicated

HAY FEVER *relief* day and night...

The extra long action of Neo-Synephrine hydrochloride makes possible control of hay fever symptoms with infrequent dosage thus enabling the patient to be comfortable during the day and obtain sleep at night

Average dose: 2 or 3 drops in each nostril

No appreciable interference with ciliary action Virtually no side reactions.

FOR NASAL USE: ½% solution (plain and aromatic) 1 oz. bottles; 1% solution, 1 oz. bottles ½% water soluble jelly ⅛ oz. tubes.

FOR OPHTHALMIC USE: ⅛% low surface tension, aqueous solution, isotonic with tears 15 cc. bottles.

PIONEERS in Research . . . and Leadership thru the years in combating OTITIS MEDIA

DOHO in realizing the need for a potent, topical, well tolerated ear medication, yet mindful that no one formula could be suitable for all conditions devoted every facility and scientific resource to the development and perfection of AURALGAN and OTOSMO SAN Each has its sphere of usefulness each has been tested and clinically proven in many thousands of cases *Reprints and substantiating data sent on request*

EACH A SPECIFIC . . . both effective!

Auralgan
IN ACUTE OTITIS MEDIA

is a scientifically prepared completely water free Glycerol (DOHO) having the highest specific gravity obtainable, containing antipyrine and benzocaine which by its potent decongestant, dehydrating and analgesic action provides effective relief of pain and inflammation

O-TOS-MO-SAN
IN CHRONIC SUPPURATIVE OTITIS MEDIA FURUNCULOSIS AND AURAL DERMATITIS

is not just a mere mixture, but a scientifically potent chemical combination of Sulfathiazole and Urea in AURALGAN Glycerol (DOHO) base which exerts a powerful solvent action on protein matter liquefies and dissolves exuberant granulation tissue, cleanses and deodorizes, and tends to exhilarate normal tissue healing in the effective control of chronic suppurative otitis media.

Scorutone
RUTIN with VITAMIN C

For the Control of Increased Capillary Fragility

SCORUTONE is a combination of rutin and ascorbic acid Rutin has been shown to be effective in the treatment of increased capillary fragility Since clinical evidence seems to indicate that it is less effective in the presence of a Vitamin C deficiency, ascorbic acid has been added as a potentiating factor in Scorutone

SCORUTONE tablets are supplied in bottles of 100 tablets, each tablet containing 30 mg of rutin and 50 mg of ascorbic acid Write for detailed information and clinical reports of the successful use of Scorutone to control increased capillary fragility

More mothers say this

about Carnation

"My Doctor recommended it"

than any other brand of

evaporated milk

RECENT INVESTIGATION shows that nearly 8 out of 10 mothers who use evaporated milk for infant feeding do so on advice of their *doctor* or *hospital*

It is significant that more of these mothers name Carnation as the brand recommended by their doctor than any other

For Carnation pioneered in developing the methods of processing refining and fortifying evaporated milk that have made it so widely accepted by authorities on nutrition Furthermore Carnation has established standards of quality and uniformity every doctor can trust

Carnation has always urged mothers to ask their doctor—not their relatives or neighbors—for advice on infant feeding We sometimes feel *that* is our most important contribution to infant welfare!

Nation wide surveys indicate that Carnation Milk is more widely used in infant feeding than any other brand of evaporated milk

The Milk Every Doctor Knows

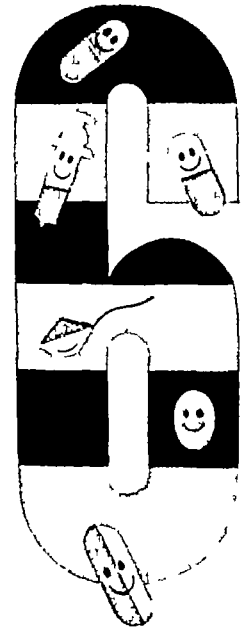
PROLONGED-ACTION PENICILLIN FOR AQUEOUS INJECTION...ONCE DAILY

Crysticillin®

SQUIBB Procaine Penicillin G for Aqueous Injection

Offering all the advantages of prolonged action penicillin without the disadvantages of the preparations hitherto available For use in any condition in which penicillin in oil and wax is indicated



ONE DAILY INJECTION	An intramuscular injection of 300,000 units of an aqueous suspension of CRYSTICILLIN provides therapeutic blood levels for 24 hours in the majority of patients—and for 36 hours in approximately 50% of patients
MINIMAL PAIN	CRYSTICILLIN contains no OIL or WAX. Consequently, pain following intramuscular injection is minimal
EASILY ADMINISTERED	CRYSTICILLIN is easily administered in aqueous suspension with a conventional syringe and needle, neither of which need be dry Blockage of needle is minimized and cleansing facilitated
STABLE WITHOUT REFRIGERATION	CRYSTICILLIN is stable in the dry state for 12 months Sterile aqueous suspension may be kept at room temperature for a period of one week without significant loss of potency

CRYSTICILLIN is supplied in diaphragm capped vials containing dry procaine penicillin G together with a minute quantity of effective and nontoxic dispersing and stabilizing agents—for suspension with sterile aqueous diluent

1,500,000 unit multiple-dose vials

300,000 unit single dose vials

Proven in the Pacific Jungles

The active ingredient of Vodisan and Vodust, Hycloromane (dihydroxydichlorodiphenylmethane), was first proven effective in the jungles of the South Pacific in combating fungous rot on cloth fabrics Now *in vivo* and *in vitro* studies have proven it to be effective against many fungous infections of the skin

Hycloromane is now available as VODISAN (Hycloromane in Solusalve) for nighttime use and VODUST (Hycloromane with India talc) for daytime use in the treatment of athlete's foot and other mycotic infections

AROUND THE CLOCK TREATMENT

Vodisan Solusalve-Vodust Powder, the combined day-night treatment for dermatophytosis and many other fungous infections, exerts continuous fungistatic and bacteriostatic actions while being safe, nonirritating and noninjurious to the skin.

Introducing a NEW COMBISUL

another step toward safer sulfonamide therapy

First to make available to the medical profession a combination of two different sulfonamides for the purpose of decreasing the danger of renal toxicity Schering now introduces a new COMBISUL* containing the three most valuable sulfonamides for systemic therapy—sulfadiazine, sulfamerazine and sulfathiazole. The mixture of these three compounds extends further[1] the proved value of previous dual combinations

COMBISUL

greatly increased urinary solubility
decreased likelihood of renal irritation
increased potentiation of therapeutic effects

COMBISUL is available in two forms Tablets of 0.5 Gm. consisting of 0.166 Gm. each of sulfadiazine, sulfamerazine and sulfathiazole and Liquid, a palatable suspension containing 0 166 Gm. of each of the same sulfonamides per teaspoonful for children and adults who cannot swallow tablets easily Indications are the same as for the individual components of the mixture.

COMBISUL Tablets: 0.5 Gm. in bottles of 100 and 1000
COMBISUL Liquid 0.5 Gm. per cc. in bottles of 4 and 16 oz.

Findings from the Saratoga Spa records*

CARBON DIOXIDE BATHS in circulatory diseases

The physiological observations of the influence of carbon dioxide baths show a decrease in the pulse rate, an increase in the pulse pressure dependent mainly on a drop of the diastolic pressure, a better emptying of the venous blood vessels, a hyperemia with increased capillary circulation, a slightly elevated minute volume output of the heart, an increase in respiration and the elimination of large quantities of the carbon dioxide through the lungs

In evaluating the results of this treatment for patients with circulatory disorders there is no ideal test of cardiac function and in these patients the ability to walk or exercise without the production of symptoms is used in judging their clinical gain In addition, in the patients with coronary disease suffering from anginal attacks, it is striking to note the decrease in the frequency and severity of these attacks In some patients they will disappear completely

Objective changes as seen in physical examination and in the studies of pulse rate, blood pressure, roentgen ray findings, electrocardiographic tracings, and vital capacity are noted in many patients

The clinical improvement of many patients undergoing treatment, their continued well being after their return home and their desire periodically to return for further treatment all indicate that the carbon dioxide bath has its place in the treatment of disorders of the circulation

As printed in International Clinics, Vol 1 page 199 March 1937

The SARATOGA SPA

"Physician, Give Heed to Thine Own Health"

Many physicians have come to the Spa for the same kind of treatments that have helped their patients here. After a restorative "cure" at the Spa, you, too, will return to your practice refreshed—revitalized—ready for the busy days that lie ahead

For professional publications of the Spa, and physician's sample carton of bottled waters with their analyses, write W S McClellan, M D, Medical Director, Saratoga Spa, 155 Saratoga Springs, New York

Listed by the Committee on American Health Resorts of the American Medical Association

There are so many kinds of Eczema

TAR IS THE MASTER REMEDY

Tarbonis is of outstanding value in

Eczema
Psoriasis
Ringworm
Occupational Dermatitis
Folliculitis
Seborrheic Dermatitis
Intertrigo
Pityriasis
Pruritus
Tinea Cruris

In 2 4 oz., 8 oz., 1 lb and 6 lb jars.

•

When infection supervenes SULTARBONIS combines the bacteriocidal properties of sulfathiazole (five per cent) with the virtues of Tarbonis.

AND THERE ARE so many tar preparations! Crude and refined white and black, and in many different vehicles In the hands of many leading dermatologists pediatricians and general practitioners, Tarbonis — because of its distinctive advantages — is the preferred tar preparation in the management of eczema.

In most instances, eczema requires intense and prolonged treatment Tarbonis presenting a 5 per cent alcoholic extract of carefully selected crude tars together with lanolin and menthol in a vanishing type cream is completely nonirritant. It is safely applied as often as desired every two hours if indicated for as long as needed without leading to superimposed irritation or furunculosis

In eczema of the face and hands Tarbonis is especially appreciated. It brings no stigma to the patient since it leaves no trace upon the skin The patient can apply it during business or social activities without arousing attention — it cannot be detected. It is greaseless, nonstaining to skin linen and clothing and nonsoiling Best of all it is free from all objectionable tarry odor exhibiting instead a pleasant soapy scent.

Welcome Relief

in POISON IVY DERMATITIS

The tormenting itch of Rhus dermatitis has few equals in routine medical practice Many patients receive early, welcome relief after injections of POISON IVY EXTRACT Arlington

POISON IVY EXTRACT Arlington is an absolute alcohol extract of Rhus leaves of established potency The use of absolute alcohol results in an extract of greater dependability Use as supplied for diagnostic patch test and for treatment of poison ivy dermatitis

Clinical evidence indicates that a single excitant is responsible for dermatitis due to poison ivy, poison oak, and poison sumac. Thus, this extract is equally applicable to dermatitis caused by contact with any of these plants.

DOSAGE: As soon as possible after appearance of symptoms, three subcutaneous injections of 0 1 cc each are given at daily intervals

POISON IVY EXTRACT

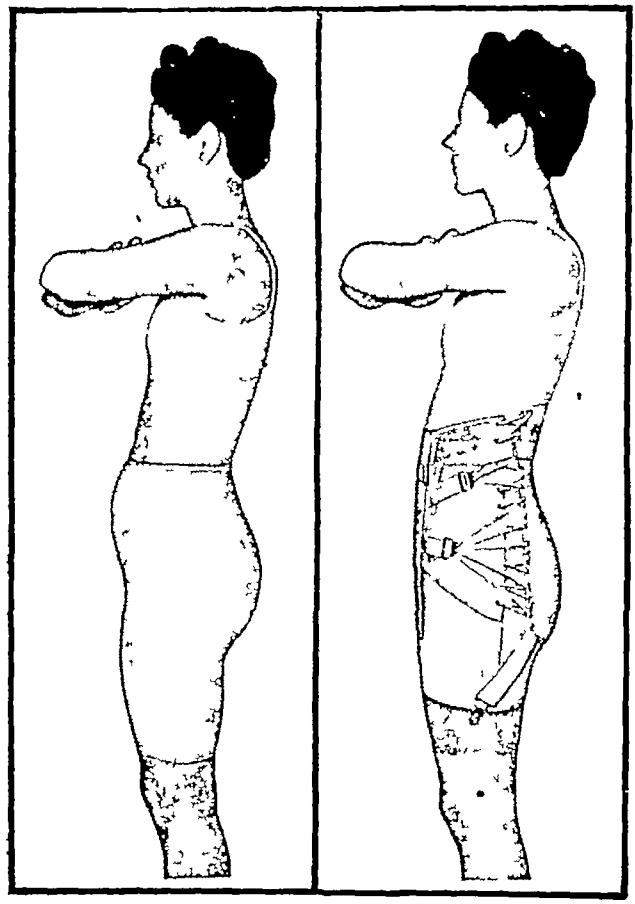
CONFIRMATION

Proven effectiveness in allergic disorders confirms the distinctive position of

BENADRYL®

as an outstanding antihistaminic agent.

Steri-Vials® BENADRYL FOR INJECTION



The clinical efficacy of the oral forms – Kapseals® capsules and elixir—is now available parenterally to meet the urgency of severe or acute conditions The prompt action of BENADRYL Hydrochloride solution has been found useful in *severe angioneurotic edema, acute urticaria acute asthma anaphylactic reactions following animal serum injections drug reactions to penicillin liver extract insulin, sodium morrhuate irradiation sickness acute exacerbations of chron ic allergic conditions*

Intravenous or intramuscular administration of 1 to 5 cc., representing 10 to 50 mg of BENADRYL Hydrochloride produces a favorable response in most cases amenable to antihistaminic therapy STERI VIALS BENADRYL Hydrochloride (diphenhydramine hydrochloride P D & Co.) are 10 cc. rubber-diaphragm-capped vials *containing 10 mg BENADRYL Hydrochloride in each cubic centimeter* of sterile aqueous solution

For oral administration BENADRYL is available in 50 mg Kapseals, 25 mg capsules, and as an elixir containing 10 mg per teaspoonful.

EFFECTIVE URINARY ANTISEPSIS *without* OCCURRENCE OF DRUG-FASTNESS

MANDELAMINE

REG. U. S. PAT. OFF.

Brand of Hexydalino
(Methenamine Mandelate)

Clinicians recognize that the value of many otherwise effective antibacterial agents is limited by the potential development of drug fastness

MANDELAMINE* therapy is conspicuously free of this disadvantage[1,2]—a feature that is especially welcome when therapy is prolonged or must be repeated. MANDELAMINE exhibits a broad range of therapeutic activity is well tolerated, and is virtually nontoxic in recommended doses.

MANDELAMINE offers these 6 outstanding advantages

1 No gastric upset
2 Wide antibacterial range
3 No accessory acidification (except when urea-splitting organisms are present)
4 No fluid regulation—no dietary restriction
5 No danger of drug fastness
6 *Simple oral dosage*—3 or 4 tablets three times a day

SUPPLIED: Enteric-coated tablets of 0.25 Gm. (3¾ grains) each, in packages of 120 tablets sanitaped; bottles of 500 and 1 000 tablets

*MANDELAMINE is the registered trademark of Nepera Chemical Co., Inc., for its brand of Hexydaline

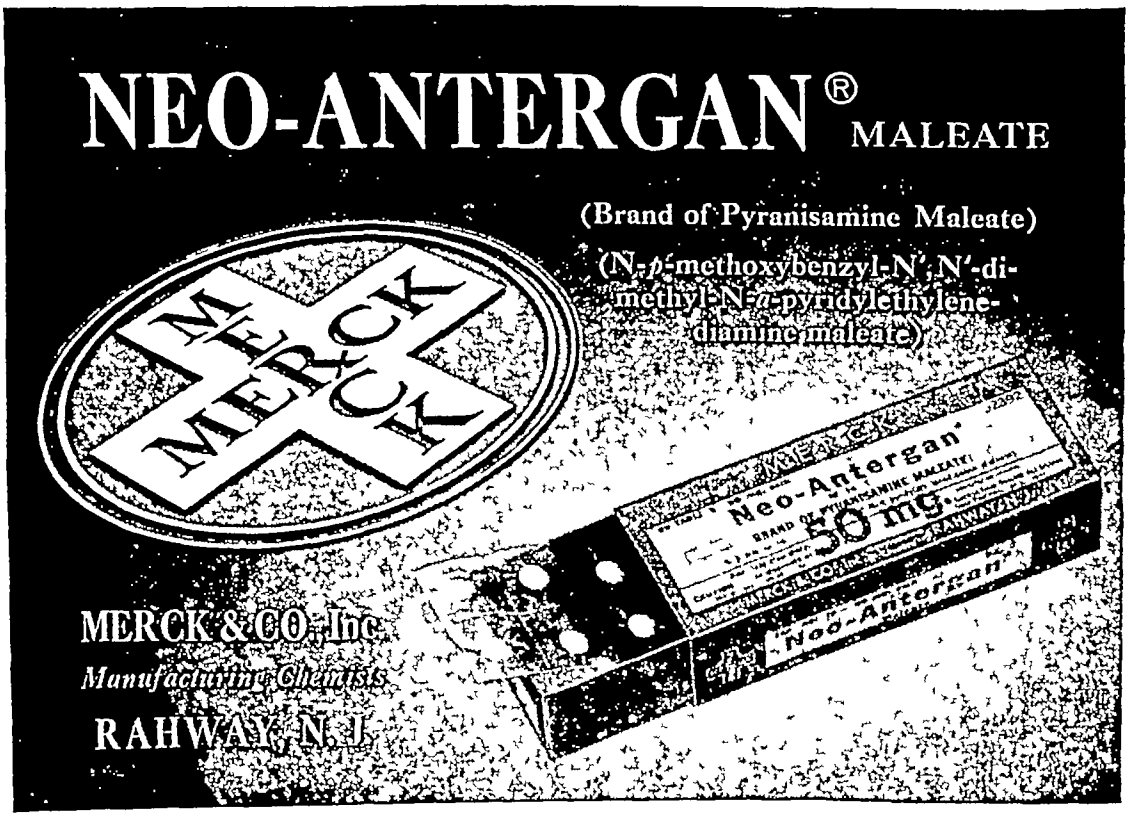
Significant Clinical Results in Certain Allergic Disorders

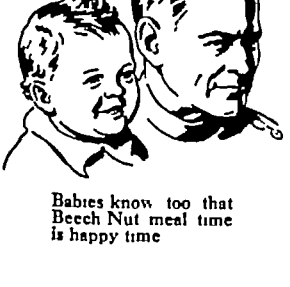
Extensive clinical investigation has established that:

★ *Neo-Antergan* produces EFFECTIVE SYMPTOMATIC RELIEF in a high percentage of patients with certain allergic manifestations



★ This remarkably efficient histamine antagonist possesses a WIDE MARGIN OF SAFETY

★ Patients who fail to respond satisfactorily to other therapeutic methods may receive effective symptomatic relief from *Neo-Antergan*



The majority of patients readily tolerate the average therapeutic dose of 50 mg , two to four times daily In some cases, 25 mg , two to four times daily, will afford appreciable symptomatic relief with minimal side effects Side reactions, when they occur, have been found to be generally mild and transient Discontinuance of treatment has been necessary only in *approximately 1½ per cent* of patients

Your local pharmacy stocks Neo-Antergan in 25-mg and 50-mg tablets, supplied in packages of 100 and 1,000

INDICATIONS HAY FEVER • PRURITUS • URTICARIA • VASOMOTOR RHINITIS • ATOPIC DERMATITIS ECZEMA • ALLERGIC DRUG REACTIONS • and certain other allergic disorders

This is the type of advertising Beech-Nut is running in newspapers and magazines to reach mothers

Babies know too that Beech Nut meal time is happy time

Two people whose judgment you can depend on!

Your baby knows *when* he wants to eat, and how much

Your baby's doctor knows *what* the baby should eat and every mother should seek the advice of a food specialist in infant feeding

There is but one more important matter for mothers to remember Beech Nut has always cooperated with doctors in the selection and processing of baby foods They are scientifically prepared—the natural food values and flavor are retained in high degree You never go wrong with Beech Nut

stands out

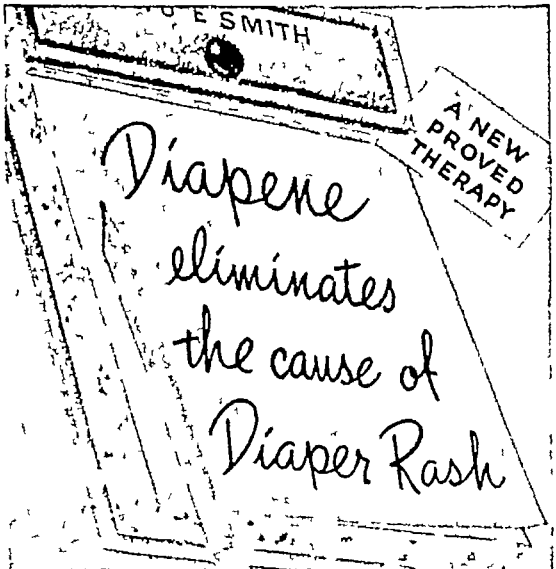
Among the profusion of new antihistaminics to choose from today *one stands out*

Trimeton

(BRAND OF PROPHENPYRAMINE)

TRIMETON not only meets the demand for a preparation with fewer side effects, but it is also approximately twice as potent as other available antihistaminics. Selected by Schering's research staff after four years of experimentation TRIMETON has been thoroughly tested in the laboratory and clinic. TRIMETON provides the allergic individual with rapid and prolonged relief from hay fever allergic rhinitis, urticaria allergic eczema, and some cases of asthma

A single tablet of 25 mg usually initiates relief within fifteen to thirty minutes which may last as long as six hours in many instances. Three tablets daily or less are sufficient for the average adult.



TRIMETON phenyl (2 pyridyl) (β N,N-dimethylaminoethyl) methane, is available in 25 mg tablets, scored in bottles of 100 and 1000

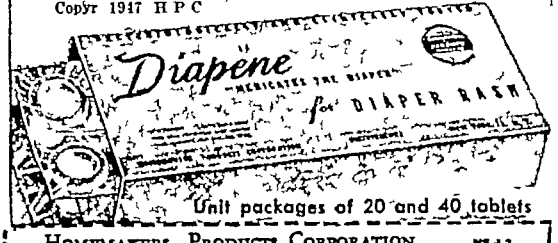
"MEDICATES THE DIAPER"



The cause of *ammonia dermatitis* is ammonia liberated by bacterial decomposition of urinary urea DIAPENE — impregnated into the laundered diaper merely by rinsing — checks the particular bacillus which releases ammonia from the baby's urine DIAPENE, therefore, prevents and relieves diaper rash **by eliminating the cause**

IMPORTANT —DIAPENE is as basically necessary as baby oil, powder or ointment, because chafing, prickly heat, allergy rashes, etc, are often aggravated by ammoniacal urine DIAPENE is a prophylactic MUST for every baby!

For prevention, medicate only "night" diapers
For treatment, medicate all the diapers
One tablet to 2 qts water, a rinse for 6 diapers

he Petechiometer*

Rexall exclusive

Rexall

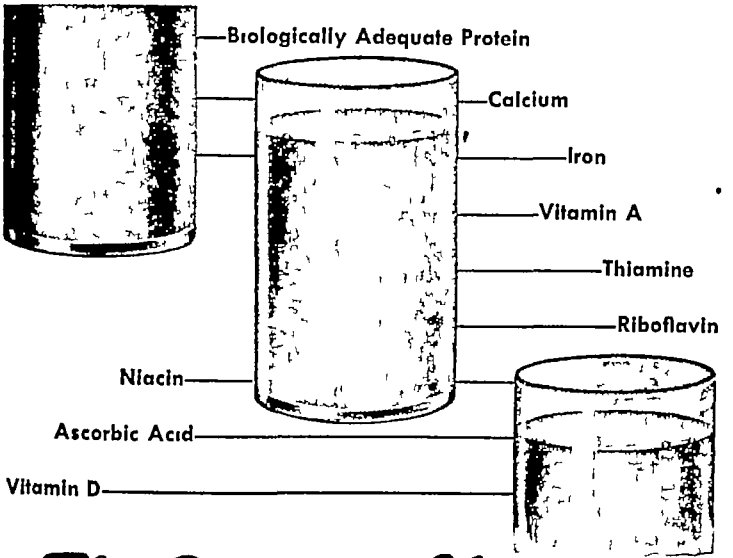
DRUGS

YOU CAN DEPEND ON ANY DRUG PRODUCT THAT BEARS THE NAME REXALL

The Petechiometer—exclusive with Rexall—is a new device used in the measurement of capillary fragility It is a simplification of the suction-type resistometer used in the Dalldorf test.

A small suction pump with a spring-returned plunger and clear plastic suction cup, the Petechiometer applies negative pressure to a hairless area of skin two centimeters in diameter A magnifying glass blown into the upper surface of the cup helps count petechiae which develop

The air is expelled from the suction cup by pressure of thumb on plunger The cup is then placed lightly but firmly upon the skin As thumb pressure is released, spring action applies suction After one minute, suction is released, after five minutes, petechiae are counted By moving an adjustable "stop" ring the test may be repeated at two additional suction levels Remember that increased capillary fragility is a complication of many clinical conditions



You can obtain the Petechiometer only at drug stores displaying the familiar blue and white Rexall sign—your assurance of drugs manufactured under rigid laboratory control, compounded with superior pharmacal skill Your Rexall druggist will be glad to tell you more about the Petechiometer Or write to Rexall Drug Company, Los Angeles, California

**Petechiometer is a registered trade mark owned by the Rexall Drug Company covering a clinical device for the measurement of capillary fragility*

The Gamut of Nutrients

When the need for dietary supplementation arises the delicious food drink made by mixing Ovaltine with milk finds wide application This dietary supplement provides generously of all nutrients considered necessary in balanced proportion for optimal utilization Three glassfuls daily in conjunction with even an average diet, raises the intake of essential nutrients to optimal levels

Its appealing taste and easy digestibility virtually assure patient acceptance, as well as consumption of the recommended three glassfuls daily

Ovaltine finds valuable use pre and postoperatively following recovery from infectious disease, in pregnancy and lactation in pediatrics in the management of food resistant children and to supplement restricted dietaries whether prescribed or self imposed as a result of food aversions and idiosyncrasies.

VOLUME 48 JULY 15, 1948 NUMBER 14

Editorials

The Annual Meeting, 1948

The one hundred forty-second annual meeting of the Medical Society of the State of New York, recently concluded, was attended by more than 6,000, of whom 5,201 were physicians This is the largest total attendance recorded at any annual meeting thus far

The House of Delegates, faced with an overwhelming mass of business to transact, was called to order Monday, May 17, by Dr Louis H Bauer, president of the Society, and thereafter the one hundred and forty-second annual meeting proceeded with the regular order of legislative, scientific, and educational work.

Invited guests were introduced who spoke briefly, principally on the subject of the development of emergency medical service for the region, the State, and the Nation. Resolutions were then received, those of greatest importance dealing with the establishment of Red Cross nation wide blood donor service, hospital expansion by the Veterans Administration, the World Health Organization, the Health Insurance Plan for Medical Service in New York City, and discrimination This year for the first time the JOURNAL will probably print the complete minutes of the House of Delegates as a supplement to one of the subsequent regular issues with an index for the convenience of members of the Society in referring to the transactions. The minutes will then be concentrated in one place instead of being scattered through a number of issues.

The Teaching Day arranged by the Council Committee on Public Health and Education, was held on Tuesday, May 18, and was devoted to nutrition, rehabilitation and physical medicine, modern trends in medical care, and a round table conference on Medical Care Insurance in New York State Participation in this program was large and active, indicating a vivid interest in the subjects under discussion A lengthy executive session of the House of Delegates was also held

The final session of the House on Wednesday, May 19, concluded with the election of Dr John J Masterson of Brooklyn as president-elect and the installation of Dr Leo F Simpson of the County of Monroe as

president The annual banquet featured an address by Dr Roger I Lee of Boston, a past president of the American Medical Association, and also the presentation of the Society's medal to Dr Louis H Bauer of the County of Nassau, retiring president

The Society is to be congratulated on the better arrangement of space this year in comparison with that of two years ago The 75 scientific exhibits were well placed, easily reached, and were of more than ordinary interest Graphic illustration of the historic and scientific work basic to the present preparation and distribution in New York State of BCG attracted the attention of many physicians who will be more and more concerned with the clinical application of the new modality to tuberculin negative reactors

Appearing also for the first time were charts presenting the nature and production of radioactive isotopes and their use in biology and medicine, showing also measurement of isotope quantity and radiation dosage, safety precautions in the use of isotopes, the making of radioautographs, and tracer and therapeutic uses of various isotopes

Where new materials and procedures are shown, the advantage of an attended exhibit becomes manifest We urge that, whenever possible, scientific exhibitors arrange to have someone qualified to answer questions present as much of the time as can be arranged during the meeting

The 127 technical exhibits in 141 booth spaces were well arranged and interesting When it is remembered that without the technical exhibitors the meeting would have to be financed by the dues of members alone, the important contribution of the exhibitors will be appreciated

Section meetings were well attended, and the space available this year was adequate to avoid crowding The large number of scientific motion pictures shown attested to the growing importance of this art in the teaching of medical subjects

Cancer Detection Clinics

In response to the propaganda for the early detection of cancer as an important factor in the reduction of mortality from this disease, diagnostic centers have been established in communities all over the country Their founding has captured the public imagination, their waiting rooms are crowded to such an extent that there is much delay and inconvenience to their clients, with the inevitable result that many ill and disappointed individuals fail to return Numbers of people have developed a cancer phobia, yet if it will make them resort to regular, general, physical examinations, so much the better While cancer is claimed to be the second most frequent cause of death, it still constitutes only a small portion of human illness An individual physician may meet with only a few cases a year, allowing perhaps for a few that may escape his attention Yet, no matter how small the number, it would be well to know of their existence and apply available remedial measures in time

Cancer detection centers and clinics are organized mainly to detect the disease, the applicant is then referred to the family physician or a hospital if a suspicious lesion is found However, merely finding a suspicious lesion by visual means alone, on vaginal examination for example, is both unsatisfactory and insufficient Most gynecologists will agree that a cytologic test or, better, a biopsy is necessary R R Newell has stated that one investigator found only three early cases of cervical cancer in 6,000 pelvic examinations, and that more than 800 symptomless persons over forty-five years of age had to be fluoroscoped in order to find one gastric cancer [1] This is indicative of a vast expenditure of time and effort, and it means, moreover, that a person of experience is essential in making an adequate diagnosis

It must be evident that the mere multiplication of cancer detection centers is not the complete answer to the problem Uniform standards must be developed Centers must be manned not only by competent

[1] News Letter of the American College of Radiology, Vol 3, July 1947

personnel but must also be prepared to make smears and biopsies and to interpret them properly This might be resented by practicing physicians who are bound to acknowledge, however, that unless practitioners develop the necessary skills themselves, people will resort to the much-advertised centers and clinics. Postgraduate instruction of the individual physician is essential, therefore, and our own State Society Committee on Health and Education among others is providing for such instruction. Its endeavors should be supported and a cooperative effort instituted among doctors, hospitals, and clinics to evaluate and care for these patients scientifically Halfway measures will not suffice

Malignant disease is stated to be on the increase Is this increase actual or is it due to the fact that more cases are recognized by the means already at hand? At present, early surgical attack or radiation is indicated for control in certain cases until we know more about the cause of the disease and until other effective means of treatment have been devised In time, properly conducted research may provide this needed information, but until we know more about this disease, the means for its early recognition provide the best hope for successful early treatment. Efforts by the profession must be concentrated on careful, periodic, general physical examinations to disclose not only specific but all other abnormal conditions. To this end the general practitioner, in particular, must develop his special skills and convince people that in these skills the public is best served Naturally, it will be an uphill job, but time will prove its advantages

Current Editorial Comment

Hormone Therapy for Breast Cancer Is Still Experimental The Therapeutic Trials Committee of the Council on Pharmacy and Chemistry[1] warns of the grave dangers associated with the treatment of mammary cancer with estrogens and androgens These are palliative and experimental, *not curative*. The approved treatment of curable lesions is radical surgery, with or without roentgen radiation While there is hope of cure, give no hormones. The palliative symptomatic relief of hormone therapy should be reserved for patients whose disease has progressed beyond the possibility of cure

Within those limitations, estrogens and androgens may be given with some hope of symptomatic relief in cases selected carefully Androgen may be administered, regardless of the age of the patient with metastatic lesions of the bones The dose is 100 mg of *testosterone propionate* parenterally three times a week for ten weeks, followed by a maintenance dose of 60 mg of *methyl testosterone a day for ten weeks* In responsive patients, after two or three weeks, pain decreases, the appetite improves, weight increases, sleep becomes natural, there is renewed interest in life, and a general improvement comparable to that following castration in cases of cancer of the prostate. Androgen usually has no influence on the primary malignant disease of the breast or on soft tissue metastases in older women, it has masculinizing effects, often causes a disturbing increase in sexual libido, and it should be used cautiously in women with a high serum calcium

Estrogen therapy in mammary cancer has been found most beneficial in lesions of the soft tissues in older women. Regressions following estrogen treatment have been noted in the primary tumor, soft tissue recurrences, and in lymph node and pulmonary metastases. Other temporary benefits include occasional relief of pain in osseous metastases, a sense of well-being, improved hemopoiesis, a better appetite, and gain in weight The dose of estrogen usually is 10 to 15 mg of diethylstilbestrol a day Estrogen therapy for carcinoma of the breast should never be given to any patient who still menstruates or who has menstruated within a period of five years It accelerates the rate of growth of the carcinoma. For estrogen therapy, the most suitable patients are those above the age of 60

In brief, hormone therapy has limited symptomatic usefulness in hopeless cases of cancer of the breast androgen for lesions of the bones, and estrogen for lesions of the soft tissues

Comparison of the Effects of Margarin and Butter on the Weight and Height of Children In a recent report, Leichenger *et al* give valuable information concerning the relative merits of margarin and butter The comparative value of those two forms of dietary fat (one of vegetable, the other of animal origin) was shown by tests for their effects on the height and weight of 267 white children between the ages of two and seventeen years, over a period of two years [1] The final study of records included 160 in the margarin group and 107 in the butter group

The diet was carefully supervised by trained dietitians, and regulated so that 25 to 30 per cent of the total calories were supplied by fat of which (in the margarin group) about two thirds was margarin The margarin used contained no fat from animal sources, and was fortified with 15,000 units of vitamin A per pound, more than the average amount in butter Under medical supervision, all the children in both groups were weighed and measured each month The results of blood studies were without significance since all figures, before as well as at the end of the test period, were within normal limits

The detailed data concerning height and weight, set forth in six tables, indicate that fortified margarin, containing only vegetable fats, and butter are equally valuable in sustaining growth and promoting health The authors make no claim that those in the margarin group were healthier simply because their diet contained margarin A comparison, however, of the degree of good health of each group and of the infirmary record of each group, shows much better conditions among the children served margarin

Radiation Hazards —Attention may well be directed to an article in this issue of the JOURNAL dealing with the hazards attendant upon irradiation, hazards that involve the physician and the technician as much as they do the patients—apparently even more so This hazard is generally underestimated, but is largely preventable if proper and adequate precautions are employed X-ray apparatus and radium or its emanations are widely employed, but their dangers are not generally appreciated

MEDICAL SOCIETY OF THE STATE OF NEW YORK

1948 District Branch Meetings

Date	*Branch*	*Place of Meeting*	*Time*
September 14	Fifth	Watertown	Afternoon and evening (dinner)
September 16	Eighth	Batavia	Afternoon and evening (dinner)
September 23	Third	Parrott House, Schoharie	Morning and afternoon (luncheon)
September 24 and 25	Fourth	Saratoga Springs	Friday afternoon, Saturday morning (dinner Friday evening)
September 30	Seventh	Veterans' Hospital, Canandaigua	Morning and afternoon (luncheon)
October 6	Sixth	Binghamton	Afternoon and evening (dinner)
October 20	Second	Garden City Hotel, Garden City	Morning and afternoon (luncheon)
October 26	First	Newburgh	Afternoon and evening (dinner)

THE ADVANTAGES OF A SERVICE CONTRACT FOR LOW-INCOME SUBSCRIBERS

MILTON J GOODFRIEND, M.D., F A C S, New York City

(Member Board of Directors United Medical Service)

TOO often the cost is a deterring factor in seeking medical care, and unnecessary and often fatal delay results It is a curious paradox that, with the remarkable advances in the development of laboratory and other procedures for the early detection and diagnosis of disease and with the increased skills attained by the profession in providing remedial measures, the ability to pay the costs of such care has become increasingly difficult for a large segment of the population.

While charity wards and clinics are available and while the traditional sliding fee schedule of physicians which permits the adjustment of medical fees to the economic needs of the patient offers a partial solution, pride often prevents the acceptance of such methods Some of the needed medical care began to be provided through the organization of fraternal groups, consumer groups, industrial health organizations in part financed by the employer and other similar methods The type of care provided was, however not of the best and in most instances was incomplete and unsatisfactory Insurance against illness and its costs began to be developed In most instances, cash payments in specified amounts were paid, but the amounts involved usually fell far short of the sums needed to pay the costs of the care provided and for the low-income group was, therefore, not practical

Upon the passage of needed legislation and the organization of nonprofit plans for providing medical care, a tremendous forward step was made. The Associated Hospital Service proceeded to provide hospitalization benefits on a service basis At the onset, the service principle applied only to the room charge, including ordinary nursing care with a limit on the amounts available for laboratory, x ray, and other services However, in effect, these were sufficient to pay the actual costs involved in the great majority of admissions. With the growth of the movement and the development of proper safeguards against abuses in utilization, the service principle has been extended so that at present the subscriber is assured that under his contract the full cost of his hospitalization is covered

In addition to board and ordinary nursing care, there is available without additional cost

1 Full diagnostic facilities of the laboratories without regard to the number or variety of tests needed

2 Complete x ray diagnostic facilities

3 The use of operating room, cystoscopic room, electrocardiography, etc

4 Physical therapy equipment

5 All standard drugs including oxygen therapy Parenteral therapy and antibiotics are provided

Such a program must have a tremendous impact on provision of proper and adequate care No longer is the question of whether or not a test shall be done or a roentgenogram ordered weighed against its cost or postponed because the patient cannot pay In fact, so successful and satisfactory has this method been in providing the best possible care that many of the more progressive hospitals have placed all their admissions on a similar service basis under an all inclusive rate policy Very recently the Associated Hospital Service has extended similar services in all accommodations including private rooms

While the provision of these hospital benefits is of tremendous value for the low income group, they necessitated the utilization of physicians chosen by the patient to whom a fee had to be paid for operative or medical care As a result about 10 per cent of admissions were obliged to give up the benefits of semiprivate accommodations and accept ward treatment, and many others found themselves in difficult financial straits because of unusual or unexpected expenses attendant upon their illness. An attempt was made to provide an insurance policy for pay ward care at a lower premium level which would include complete medical coverage on a per diem basis This was to be experimental and required changes in the charter of the City and changes in the rules of most institutions There was considerable resistance on the part of both institutions and physicians, and very little progress was made

The need for providing some sort of insurance for these low income groups was great, and several nonprofit organizations have developed The low income group, however, cannot be considered as a homogenous group, nor are their needs similar The group is divided as follows

1 Totally indigent Complete service benefits can be extended to such individuals either as

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City Teaching Day May 18, 1948.

medical charity through clinics, house calls, welfare departments, and wards of hospitals or by the payment of the premiums necessary to provide such care to an existing nonprofit insurance company by the State

2 Those who cannot meet full costs of even ordinary medical care and must be subsidized by either State or industry Such a program is being carried on experimentally with the payment for most part made by the employer The patient received full medical care in the house, office, or hospital

3 Those capable of meeting costs of ordinary illnesses but requiring some method of assurance against unpredictable cost of catastrophic illness

In this latter group the greatest success has so far been obtained A fee schedule was established which represented a reasonable return for the services rendered and which was accepted as full payment for low-income patients Arbitrarily, the income level for a family entitled to such benefits was set at $2,500 in the contract issued by United Medical Service, which has also provided an arbitration clause granting the right of appeal by the subscribers with incomes under $3,500 per annum against any excess charge by physician or surgeon whenever it is felt that such excess might create hardship to the family About 14,000 physicians in the metropolitan area have accepted this provision of the contract There has been a great public interest in this type of contract, as is evidenced by its rapid growth in the metropolitan area and elsewhere About 750,000 subscribers are presently enrolled in U M S , and a similar type contract through the State has resulted in a total enrollment of 1,025,000, an increase of over 22 per cent in the past year Such a contract now guarantees a free choice of hospital and completely free choice of physician or surgeon with the knowledge that the entire medical costs of a particular illness or accident are available Insurance fees are comparatively cheap and well within the means of this low-income group, and the method offers least disturbance to medicopublic relationship

Complete coverage on a service basis has been attempted on an experimental basis by the United Medical Service utilizing the fee schedule as a method of payment The costs of such a policy are considerable and, in most instances, not within the ability of the patient to pay In those policies issued by U M S the entire cost had been borne by the employers That there is no great demand for this type of coverage is evidenced by the fact that, although 25,000 contracts were authorized for the experiment, only 21,000 have been sold in the past three years

A similar type of policy is being issued by HIP with payment on a capitation basis The majority of contracts so far issued under this plan have been subsidized by the City of New York which pays 50 per cent of the costs, including hospitalization No facts are yet available as to the income distribution of subscribers to this plan, an important factor to consider If medical service rendered to the public is to be maintained at a high degree of competency, the return to the physician must be adequate and must take into consideration that, in acquiring the increased skills, greater specialization has become necessary and that the production years of the physician have been curtailed At the present time, incomes received by physicians seem satisfactory since they represent an "extra income" while maintaining a regular practice on the traditional basis It will be necessary to project the implications of this plan on a full-scale basis with full-time participation before a proper evaluation is possible This is particularly necessary because it is sold to the public with income levels representing almost 90 per cent of the total population Degree of utilization by subscribers is unknown

In the United Medical Service program of complete medical coverage, many danger signals are evident It is difficult to differentiate medical needs and medical demands The latter, if excessive, may destroy the plan either by making the rates too high for the family to afford or by making the return so small to the physician that the quality of care suffers Among the problems already presented are factors of prolonged medical care in chronic disease, recurrent conditions such as hay fever and other allergic manifestations, hormonal and glandular therapies, and neuroses of all types In an attempt to gain the necessary information, the United Medical Service provides full payment for all home and office visits and complete in-hospital coverage at present For all specialist examinations at home and in the office, including roentgenology, radiotherapy, and laboratory examination, a 50 per cent allowance is made Our experience is being closely studied with a full realization that the ultimate aim is the provision of full coverage to meet the needs of the low-income group It is our feeling that this can be obtained only by an objective study of the realities If it is found that a reduction in the fee schedule must be made and that by such action a greater number of the low-income groups can be attracted into the prepayment plan, a program of this sort will be launched A considerabl amounte of education of both the public and the physician will undoubtedly be necessary before a large-scale launching of such a program can be effected

There can be no doubt that only by the establishment of such a service contract can the real needs of the low-income families be met, and the medical profession, always ready and willing to render service to the needy, will, with proper safeguards, assume its rightful share in providing this

BENEFITS OFFERED BY THE VOLUNTARY NONPROFIT MEDICAL CARE PLANS OF NEW YORK STATE

CARLTON E WERTZ, M.D Buffalo New York

(*President, Western New York Plan Inc.*)

IN New York State we have six medical care plans that are approved by the medical profession the United Medical Service of the New York City area, Northeastern New York Medical Service of Albany, Medical and Surgical Care, Inc., of Utica, Central New York Medical Plan, Inc , of Syracuse, Genesee Valley Medical Care, Inc., of Rochester, and Western New York Medical Plan, Inc , of Buffalo One can readily see that the whole state is covered, although there is quite a variety in the types of benefits offered, and some are service contracts within a certain wage limit while others are indemnity contracts Since the first plans started operation about eight years ago when very little was known about this type of insurance, much had to be learned by trial and error Many of our ideas had to be modified as our statistics grew Today, we are pretty well able to tell what benefits a plan can safely provide at a premium that the average subscriber can afford to pay

At the present time the United Medical Service offers the three following types of contracts

1 *Surgical Plan* —This provides surgical benefits including treatments of fractures and dislocations and, in the family contract, obstetrics

2. *Surgery-Medical Plan* —This provides the same surgical benefits, plus medical care allowances when patient is hospitalized

3 *General Medical Plan* —This provides the surgical-medical benefits, and obstetrics, allowances for house and office calls at $2 00 for office and $3 00 for house visits, paid up to 20 visits in any one illness, and allowances for specialists' care Limited to group enrollment and employer must contribute. These are service contracts with wage limits of $1,800 for an individual and $2,500 for a family

The Northeastern New York Medical Service Inc , offers a medical and surgical contract which provides surgical benefits, anesthesia, emergency, first aid maternity care, medical services in the hospital limited to three weeks with a maximum of $150 initial hospital visit $5 00 and subsequent daily visits $3 00 An additional visit is $1.50 with extra allowance for long orthopedic cases extending to six weeks, with $1 75 per day for the fourth week, $1 50 per day fifth week, and $1 25 per day sixth week

This is a service contract with the following income limitations $2,000 for individual, $2,500 for applicant and spouse and $3,500 for applicant and members of family group

Medical and Surgical Care of Utica offers the following

1 *Surgical and Special Benefits* —This provides benefits for surgery and treatment of fractures and dislocations plus $10 for anesthesia in hospital, $10 for x ray, $5 00 for basal metabolism, $5 00 for electrocardiogram and $7 00 for special laboratory Dependents receive only one-half of the surgical fee

2 *Surgical and Special Benefits Plus Medical Expense Benefits* —The above benefits plus allowances of $2 00 for calls while in hospital for subscriber or dependent One call a day for a total of twenty-one calls during any one hospital stay and three calls within ten days after hospital discharge at $2 00 in physicians office or $3 00 elsewhere A total of 48 calls for a subscriber or dependent a year, but not over 150 calls for subscriber and his enrolled dependents during contract year

The Central New York Medical Plan of Syracuse offers

1 Surgical contract provides indemnities for surgical operation and procedures, treatment of fractures and dislocations, and maternity care under the family contract Ten dollars is allowed for anesthesia administered by a physician, $15 for diagnostic x ray in surgical cases

2 Medical-surgical contract which provides the indemnities of the surgical contract plus 25 house or office calls for the subscriber and 15 calls for each dependent per year The first two calls in each disability are not reimbursed

$ 2 00 for each call in hospital-medical
$25 00 for diagnostic x ray
$10 00 for therapeutic x ray
$ 5 00 for consultation in any one disability
$ 5 00 for specialist endoscopic examination
$ 5 00 for each electrocardiogram (maximum $15 00)
$10 00 for laboratory service (basal metabolism alone $5 00)
$10 00 for allergy tests

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York New York City Teaching Day May 18, 1948.

$10 00 for physiotherapy
Rates Surgical $0 60 and $1 70, medical-surgical $1 50 and $3 00

The Genesee Valley Medical Care offers an indemnity surgical contract which provides benefits for surgical operations, the treatment of fractures and dislocations, and maternity care Ten dollars is allowed for anesthesia, and $15 maximum for x-ray when followed by surgery The rates are $0 60 and $1 70

The Western New York Medical Plan at present is offering only the surgical indemnity contract which provides benefits for surgical operations, treatment of fractures and dislocations, and maternity benefits, with allowances of $10 for anesthesia and $15 for diagnostic surgical x-ray The rates are $0 60 and $1 70

Thus it is seen that we have plans with a wide variety of benefits in New York State, and some are service contracts within certain wage limits while others are indemnity contracts with no wage limits

The limitations and exclusions and conditions not covered do not vary greatly in any of the contracts These are mainly as follows

1 Conditions existing at or before membership
2 Occupational disease or injury
3 Conditions resulting from use of drugs or alcohol
4 Services to anyone who had prior to membership cancer, diabetes, osteomyelitis, tuberculosis, chronic nephritis, or coronary thrombosis
5 Hospital charges, drugs or appliances, nursing fees, dentistry, blood donor service, preventive vaccinations or inoculations against disease, and eye examinations
6 Congenital lesions

Most plans have a waiting period of three to ten months for tonsil and adenoids and hernia operations and a ten-month period for maternity The waiting periods and pre-existing exclusions are usually waived where 75 per cent of large groups are enrolled

The benefits under the voluntary nonprofit plans average at least a third more than the contracts offered by the commercial companies

The question of the possibility and the advisability of including house and office calls in our plans opens up a big field for discussion We now have enough statistics on exposure and utilization of surgical and maternity care to know what services can be provided for a reasonable premium with a safe margin to provide the necessary reserves, and the same can be said about in-hospital medical care However, up to the present time, there is no way to predict the demand for house and office calls, and there is no way to check the many abuses that develop when they are included in a plan Many ways have been and are being tried Limiting the number of calls per year, providing a coinsurance clause having subscriber pay half of the first three or four calls, and no payment for the first two or three calls are some of the so-called controls

All of these require considerable bookkeeping, both by the plan and by the member physician, and often lead to much confusion, especially where the patient leaves one physician to go to another I would advise careful study before any plan ventures forth on this so far uncertain liability

I believe that the time has come when all the plans of the State should get together and develop a single plan, an in-hospital medical-surgical contract to be sold by all the plans, having the same benefits and premium rates throughout the State This could be sold in addition to the present contracts, and I believe would appeal to employers who have branch offices or factories throughout the State

The plans have done a wonderful job in the few years of their existence, and are still in their infancy with a great future ahead How far they go will depend greatly on the continued and increasing cooperation of the medical profession Each physician should be our best public relations man and our best salesman

As the plans grow and experience is gained and as the reserves mount, we must always be planning ahead with the idea of increasing the benefits to the subscribers as fast as possible These changes must be approved not only by your local plans but also by the State Department of Insurance whose duty it is to see that the subscriber is properly protected at all times I would like at this time to compliment the Department on its interest and fine cooperation with all the plans

We have a big job to do How well it is done depends on each and every one of us

---

COSTS OF FEDERAL AND STATE GOVERNMENTS

A study of this country's budget request made by the President for 1949 of $39,669,000,000 has been released by Senator Styles Bridges of New Hampshire, which shows, state by state, the pro rata cost of the President's budget compared with the cost of operating each state's own government. Of interest are the figures for New York. The cost of the Federal Government in our State is $8,457,000,000, that of the State itself, $649,000,000 In other words, Federal exceeds State cost thirteen times

DIFFERENTIAL DIAGNOSIS OF PULMONARY LESIONS

STANLEY B CLARK, M D , Dunkirk, New York

(From the Department of Roentgenology Brooks Memorial Hospital)

LESIONS of the chest, next perhaps to those of the gastrointestinal tract, offer the greatest challenge to the roentgenologist's diagnostic skill In view of this I have compiled certain roentgenologic criteria, based primarily on the essential underlying pathology, for the differential diagnosis of the more common pulmonary lesions.[1] If the type of lesion is recognized radiographically and the underlying pathologic process is appreciated, it is possible in most instances to make a relatively accurate differential diagnosis when the above are correlated with the clinical data. In most instances the basic gross pathology can be accurately correlated with the radiographic findings. However, it is first essential that the normal and the normal variations commonly seen in chest radiographs be differentiated from the abnormal or pathologic processes when present

It is the desire of the author that this paper serve as a guide for the physician in general practice who most often first encounters the lesions presented and who first has the occasion to correlate clinical, pathologic, and roentgenologic data in attempting to arrive at a correct differential diagnosis The pathologic and roentgenologic findings are presented with this in mind and the lesions are grouped according to the basic underlying pathologic process.

No attempt has been made to discuss etiology, symptomatology, or treatment as these are outside the scope of this presentation. Likewise, pulmonary manifestations of rarer diseases, such as Loeffler's eosinophilia, erythema nodosum, periarteritis nodosa, and others have been purposely omitted, as have primary mediastinal lesions with the exception of bronchogenic carcinoma.

Destruction of Pulmonary Tissue

Lung Abscess and Gangrene of the Lung —These processes usually involve the lower lobes probably because of the easy accessibility of infection through and poor drainage from the lower lobe bronchi. The right lower bronchus is more vertical in position which may account for a slight prevalence in the involvement of the right lower lobe over the left lower lobe. The abscess is always subpleural in location leading in most cases to a localized pleurisy with adhesions. At first it is a solid mass of inflammatory tissue which later breaks down to form a necrotic cavity the contents of which are expectorated through the bronchi

Radiographically a rounded cavity, often with a fluid level, can be distinguished surrounded by a localized area of dense pneumonitis. In the early stage, before liquefaction occurs, it appears no different from any other type of localized pneumonitis The fact that the abscess extends to the pleura is not always apparent, even on films taken at right angle projections It is well to remember that the cavity will disappear radiographically if it becomes filled with exudate so as to displace the air This occurs when the bronchus leading to the abscess becomes obstructed and is concomitant with a cessation of the expectoration. It should not be construed as indicating healing of the process since the only criterion for cure is complete disappearance of the infiltration and the cavity

If spontaneous recovery does not occur or if external drainage is not carried out, sooner or later the process spreads to involve other portions of the lung The mode of spread is either by direct extension or through the bronchi. The opposite lung may become involved by way of the tracheobronchial tree.

Bronchiectasis —This condition usually starts as a bronchial dilatation and progresses to actual excavation of the pulmonary parenchyma to form an abscess cavity The dilated bronchi are of two forms, cylindrical and saccular Either or both may occur however the former is more common In most instances the process is bilateral and tends to involve the lower rather than the upper lobes Because of the initial bronchial dilation, purulent material stagnates in the involved bronchi, further adding to the weakening of the bronchial walls According to Boyd the most significant lesion is the destruction of the bronchial musculature and elastic tissue with resultant weakening of the wall and subsequent dilatation [2]

Radiographically there may be no indication of a pathologic process or there may be areas of infiltration, interstitial in distribution, at one or both bases with suspicious areas of "cavity" formation interspersed The "cavities" are actually dilated bronchi The infiltrates, as seen on the plain chest film, are due to progression of the inflammatory process outside of the bronchi and therefore, tend to follow the course of the bronchi

are voluminous and pale, the alveoli are distended, and their walls are atrophic with an increase in fibrous tissue Large blebs or bullae project on the surface as a result of breakdown of the alveolar septa secondary to the increased intra-alveolar pressure Atrophic emphysema is seen in old age and in wasting diseases and is not a true emphysema There is atrophy and disappearance of the walls of the alveoli so that large spaces are formed The alveoli per se are not distended

Radiographically, the two forms of emphysema are not readily distinguishable In the atrophic form, there is increased radiolucency, the bronchovascular markings standing out in sharp contrast to the hyperaerated parenchyma In the hypertrophic form, there is, in most cases, an underlying chronic bronchial infection with thickening and exaggeration of the peribronchial and interstitial connective tissue The lungs show generalized hyperaeration with a fine interlacing network of strandlike shadows throughout as a result of the interstitial fibrosis

There is also increase in the size of the chest, with widening of the intercostal spaces, flaring of the ribs, and flattening and depression of the diaphragm, secondary to the increase in lung volume The bronchial infection usually extends to the pleura by way of the peribronchial lymphatics This often results in pleural adhesions which manifest themselves as fine lines along the fissures, tentlike shadows at the borders of the diaphragm and mediastinum, and by partial obliteration of the costophrenic angles Under the fluoroscope, diaphragmatic excursions are often seen to be limited or absent during quiet respiration

Changes in the pulmonary circulation resulting from emphysema are well known and will not be discussed

Lesions Primarily Interstitial in Location

Primary Atypical Pneumonia [5]—A pathologic picture that is primarily one of an interstitial pneumonia with accompanying destructive or degenerative changes in the alveolar and bronchial epithelium is presented There is hemorrhagic thickening and edema of the interalveolar septa and infiltration of the interstitial tissues with lymphocytes, monocytic cells, and neutrophilic leukocytes The terminal bronchial lumens are filled by a fibrinoplastic exudate and often show diffuse necrosis

Radiographically, the infiltrations show great variation as regards extent, character, and duration There are certain general statements according to Jamison regarding atypical pneumonic infiltration which he believes are justified and which merit repeating [5] For instance, pneumonias of this type are rarely lobar in character or distribution, the majority are localized to the middle or lower lung fields, and they are slow in resolution, usually passing through an intermediate stage of peribronchial infiltration and occasionally shifting from one part of the lung to another

Infiltrations of primary atypical pneumonia fall into two main classes according to Jamison, one, a peribronchial type, and the other, a more or less confluent type of pneumonic consolidation The peribronchial type of infiltrate appears as fuzzy, roughly linear areas radiating from the hilum or as patchy or mottled areas, usually closely associated with the basilar bronchovascular markings Frank consolidations of the confluent type are found in the middle or lower lung fields The infiltrations vary from a soft homogeneous haze to a density approaching that of lobar pneumonia True lobar distribution is seen only rarely, as the disease has no respect for interlobar boundaries

Another interesting feature brought out by Jamison is the occasional presence of central pneumatoceles which develop within zones of consolidation producing cavity-like appearances Such pneumatoceles disappear as the surrounding pneumonia resolves

Boeck's Sarcoid—These lesions are discrete tubercles composed of epithelioid cells and giant cells These tubercles differ from those of tuberculosis in that they do not become confluent, do not undergo caseation, and do not calcify Healing occurs by fibrosis, resulting in the production of a connective tissue scar

Radiographically, the enlarged hilar and mediastinal nodes are outstanding They are usually bilateral, smooth and lobulated in outline, resembling malignant lymphoma Following the nodal enlargement, there can be seen coarse infiltrates radiating into the adjacent lung fields from the hila Finally, coarse mottling appears in both lungs Regression of the lesions is in reverse order, is very slow, and leaves little, if any, scar

The marked pulmonary involvement found by x-ray, in contrast to the paucity of clinical signs and symptoms, is a striking feature of the disease It is important and often difficult to differentiate the pulmonary lesions of sarcoidosis from those of tuberculosis and silicosis Extrapulmonary manifestations of sarcoidosis are sometimes seen and, when present, may aid in establishing the diagnosis Bone lesions are infrequent but characteristic when present Splenic enlargement is sometimes seen radiographically where it is not palpable clinically Gastrointestinal sarcoidosis may simulate regional enteritis Again, discussion of these and other extra-

pulmonary manifestations is outside the scope of this paper, and they are mentioned only as an incentive for further investigation when the problem of differential diagnosis of Boeck's sarcoid arises.

Replacement of Normal Pulmonary Tissue by a Pathologic Process

Metastatic Tumor.—This may reach the lungs by way of the blood stream or the lymphatics. Hematogenous spread to the lungs is more often seen in primary lesions of the breast, thyroid, kidney, and prostate, where the venous return is by way of the vena cava directly to the right heart. Primary lesions of the gastrointestinal tract, particularly the stomach, and also the pancreas, gallbladder, and ovary, on the other hand, more often metastasize to the lungs by the lymphatic route. Culver reported four interesting cases of miliary carcinosis of the lungs.[6] In two, the gallbladder was the site of the primary lesion, while the others were primary in the stomach (radiographic diagnosis) and pancreas. While hematogenous spread to the lungs from primary cancer of the gastrointestinal tract and associated organs is not common it does occur and should be considered in the differential diagnosis.

Metastatic neoplasms of the lungs, even though they be of considerable size, usually give rise to no abnormal physical signs detectable in the clinical examination of the chest.

Radiographically, the lesions in hematogenous carcinosis vary in size, are usually multiple, and roughly rounded with ill-defined borders. They are more numerous in the lower than in the upper portion of the chest, and several may coalesce to form larger areas of density. Both lungs are often involved. The pleura may become secondarily involved, producing an effusion. In metastatic sarcoma, the densities are larger and rounded with discrete borders and do not tend to coalesce.

In lymphatic extension of metastatic tumor, the densities are interstitial in distribution radiating from the hilum. Underneath this linear network of increased density can be seen less distinct, fine, miliary nodules which according to Mueller and Sniffen correspond to the point of intersection of the linear streaks or represent fine lymph vessels which are hit edge on by the roentgen rays.[7] The densities are due to dilatation of the peribronchial and perivascular lymphatics with cancer cells.

Primary Lung Tumors.—These are bronchogenic in origin, and hilar bronchial, or peripheral in location depending on the site of origin in the bronchial tree. Histologically they may be divided into three types: the cylindrical cell, the small cell, and epidermoid or squamous cell carcinoma. All three types may be found in the same lung and there is no sharp line of division between the different groups.

A primary carcinoma spreads from the original site through the lung to the lymph nodes and to distant organs.

Spread through the lungs may occur in two ways. The cells may extend along the terminal bronchioles and become implanted in the alveolar epithelium (bronchogenic spread), or they may invade the peribronchial lymphatics (lymphatic spread). The mediastinal lymph nodes are always involved and may be so increased in size as to lead to an erroneous diagnosis of primary mediastinal lymphoma. Other neighboring glands, as well as distant organs, may be invaded.

Radiographically, an atelectatic lobe(s) may be the only finding as the density of the collapsed portion of the lung may obscure the shadow of the tumor. In other instances the actual tumor can be visualized, often in the region of the hilum. Pleural fluid may obscure both the primary tumor and an underlying atelectasis. If the mediastinal structures are not appreciably shifted in the presence of a considerable collection of pleural fluid the possibility of an associated atelectasis should always be considered. The tumor itself when visible radiographically, appears as an ill-defined mass of variable size, usually near the hilum, the borders of which infiltrate the surrounding pulmonary parenchyma.

It is important and often difficult to differentiate lung tumor from tuberculosis and primary atypical pneumonia. Tuberculosis usually involves one or both upper lobes. The infiltrations are feathery in appearance and patchy in distribution, often showing cavity formation. The clinical and laboratory findings are often times essential in arriving at the correct diagnosis. Atypical pneumonia is essentially a peribronchial infiltrative process with an associated alveolar element at times. The entire process may heal slowly or may clear more rapidly in one area of the lung, only to reappear in another. Careful correlation of the clinical, roentgenologic, and laboratory findings must be made in certain instances before the correct diagnosis can be determined.

In primary lung tumor, there is commonly an associated secondary inflammatory process which under proper treatment will subside, giving a false impression, both clinically and radiographically, that the patient is on the road to recovery. Bronchoscopy will often clinch the diagnosis and should not be deferred despite a contrary clinical course if repeated radiographic examinations suggest the presence of a primary lung tumor.

Procrastination may mean the difference between an operable and an inoperable tumor

Alteration in Pleural Density

Pleural Thickening—This end result of pleural infection is caused by the organization of inflammatory exudate covering both the visceral and parietal pleura and eventually producing an extensive fibrosis The thickness varies according to the amount of exudate laid down at the time of the active infection

Normally, the pleura is not visible in the chest radiograph Lung fissures, obliterated by pleural adhesions, are visible only if they are situated in a plane parallel with the direction of the rays The importance of recognizing the normal positions of the lung fissures cannot be stressed too much, since slight variations in their positions may be the only clue leading to the correct radiographic diagnosis of a pulmonary pathologic process

Localized adhesions are best seen in films taken in deep inspiration as the tension on the parietal pleura causes them to be drawn inward with their base on the pleural surface This type of adhesion is commonly seen over the diaphragm and the borders of the mediastinum More generalized pleural adhesions involve the region of the costophrenic angles which may become obliterated There may also be seen a more or less sharply defined, narrow, dense rim along the chest wall extending from the apex to an obliterated costophrenic angle

Dense adhesions along the mediastinal aspect of the lungs cause a sharp straightening of the mediastinal and cardiac contours, partially obliterating the normal configurations of the aorta, pulmonary artery, and the heart Unusually dense adhesions may cast a faint, even shadow over the chest, obscuring, in part the underlying lung markings Retraction of intercostal spaces and pulling over of the heart and mediastinum secondary to an old, contracting, pleuritic process must be differentiated from similar changes resulting from an atelectasis

Tumors—Pleural tumors are either primary or secondary, the latter being more common Localized primary tumors arise from the subpleural tissues of either the visceral or parietal pleura Tumors of the parietal pleura present a great variety of forms as they may originate from any of the underlying structures They are usually malignant, invading the chest wall and metastasizing to the mediastinum and distant organs Visceral pleura tumors, on the other hand, are usually benign

Mesotheliomas are diffuse tumors arising from the serosal cells proper They produce thickening of the pleura which may extend over a considerable area Either the parietal or visceral pleura or both is involved

Secondary tumors of the pleura are, for the most part, carcinomas and take the form of multiple, small nodules scattered over the surface of the pleura

Radiographically, diffuse primary pleural neoplasms and massive pleural effusion have a similar appearance One characteristic of diffuse pleural tumor, if present, may serve to differentiate it radiographically from effusion, that is, invasion of the chest wall with the formation of localized areas of nodulation in the soft tissues It should be borne in mind that pleural effusion and tumor frequently coexist, often necessitating aspiration as a diagnostic procedure

Localized pleural neoplasms are usually well-demarcated, rounded densities which may or may not show lobulated borders Radiographs taken in various projections following thoracentesis and air injection cannot be overemphasized as a diagnostic procedure and are necessary for accurate localization in most instances

Metastases to the pleura are commonly evidenced by the presence of a pleural effusion In other instances, the actual tumor mass or masses may be visualized along the periphery of the pulmonary fields

Physicians who are bored with the plethora of papers on tuberculosis should remember that preaching religion is still necessary after hundreds of years —*Exchange*

Bronchiectasis may not cause copious sputum, there may be no streaking, cough may be absent, fingers need not be clubbed, and rales may be absent —*Exchange*

SUCCESS WITH ORAL MERCURIAL DIURETIC.

HARRY A SOLOMON, M.D New York City and ALBERT ABRAHAM, M D, Morristown, New Jersey
(*From the Fourth Medical Division Bellevue Hospital*)

PATIENTS with congestive heart failure may continue to carry on for many years They require constant medical care, and, of course, their treatment may have to be varied with changing conditions. In the treatment of these cases, mercurial diuretics have an important if not indispensable place, the parenteral mode of administration being almost universally favored However in our experience with long term treatment of heart failure, potential or severe, we have frequently been able to obtain better results with the oral mercurial diuretics than with the other forms of mercurial diuretics

To demonstrate this point, we are reporting the following illustrative case

Case Report

The patient was admitted to the hospital for the third time on July 31 1946 She was a 53-year-old white housewife who complained of dyspnea at rest orthopnea, and mild weakness. All three of these disabilities had been progressing for two weeks and were now incapacitating The patient was known to have rheumatic heart disease (inactive) and had been attending the outpatient cardiac clinic intermittently since December 1944

First Hospital Admission.—Her first admission was on November 25 1944 with complaints of enlarged abdomen, swelling of legs, and dyspnea of three weeks' duration. However the dyspnea had actually been present and slowly progressive for three and a half years. The following significant physical findings had been recorded The patient appeared moderately and acutely ill and dyspneic. There was moderate pulmonary congestion and peripheral edema. The heart was enlarged systolic and diastolic murmurs were audible at the apex. Auricular fibrillation was noted with a pulse rate of 80 and a ventricular rate of 128 The blood pressure was 110 systolic and 80 diastolic. The liver was enlarged to three fingers below the right costal margin.

The patient received bed rest, restricted salt and water intake, digitalis, and a total of three doses of mercupurin (2 cc. each) parenterally Her admission weight was 248 pounds, and when discharged on the thirty-first hospital day, she weighed 184 pounds. She was referred to the cardiac clinic for further guidance and given a maintenance dose of digitalis, 0 1 Gm. daily With the latter and an occasional dose of mercupurin (2 cc) parenterally the patient managed fairly well but slowly decompensated again and was admitted for the second time on February 22, 1946

Second Hospital Admission.—At this time, the patient stated that dyspnea, ankle swelling, and a nonproductive cough had all been present for several weeks. Physical examination on admission revealed the patient to be moderately ill In addition to the findings noted at the time of the first admission there were a diastolic blowing aortic murmur a 'fat apron covering the lower abdomen, and massive edema of thighs and buttocks. She weighed 213½ pounds on the eleventh hospital day

The patient received the same therapy as on the first occasion of hospitalization except that she received a total of 15 doses of mercupurin (2 cc. each) parenterally and two courses of quinidine, each one consisting of eight doses (0 4 Gm. each dose) Aparacentesis abdominal yielded 5 500 cc. of fluid.

The patient was discharged on the seventy first hospital day She weighed 177½ pounds and felt capable of carrying out her duties at home Despite a maintenance dose of digitoxin 0.2 mg. daily, mercupurin 2 cc. weekly and ammonium chloride 2.0 Gm daily she slowly began to decompensate again For two weeks prior to the third admission, she had suffered progressively severe dyspnea at rest, marked orthopnea, and weakness. On July 31 1946 these symptoms had become so severe that she again required hospital care.

Third Admission.—Review of the patient's history at the time of the third admission revealed that the actual onset of symptoms was seven years previously in 1939 (age 46) These early symptoms were dyspnea on exertion and ankle swelling. Progression of symptoms was slow until the first episode of cardiac failure but had accelerated since then Neither the family history nor the patient's past history was contributory

On the third admission, the patient appeared *small but well developed and well nourished* She was acutely ill with intense respiratory embarrassment, literally, sitting up in bed and gasping for breath.' Her temperature was 100 6 F., the pulse 96, respiration 40 and blood pressure 140/80 The skin was dry and warm. Pendulous folds of edematous skin were evident about the lower abdomen, buttocks, and thighs. No lymph nodes were palpable. The retinal vessels were tortuous and showed moderated arteriovenous compression but no hypertension was noted while she was under our observation. The ears nose, and throat were normal. The teeth were poor The neck was relaxed, and the great vessels were distended, but there was no thyroid enlargement or displacement of trachea. Examination of the lungs revealed numerous, medium moist rales at both bases, more evident posteriorly When the heart was examined, a point of maximal impulse could not be palpated. The sounds were of fair quality at apex and base. There were short harsh systolic and diastolic murmurs at the apex but no palpable thrill. The aortic

murmur reported at the time of the second admission was not audible The pulse rate and the ventricular rate were both 96, the rhythm was totally irregular The abdomen was obese, tympanitic, and very large, a fluid wave was elicited The lower extremities and buttocks were massively enlarged The soft tissues were heaped up into large corrugations (folds) from the ankles to the iliac crests Some pitting edema was present, but much of this enlargement was due to a firm, diffuse, brawny type of edema. The admission diagnosis according to the "criteria" was as follows (*a*) rheumatic heart disease (inactive), (*b*) enlarged heart, myocardial fibrosis, and mitral stenosis, and insufficiency, (*c*) auricular fibrillation, mitral stenosis and insufficiency, decompensated

Course in the Hospital—Shortly after admission the usual therapy, bed rest, sedation, restricted salt and water intake, and ammonium chloride, 2 0 Gm. thrice daily, was instituted The maintenance dose of 0 2 mg digitoxin daily was continued. With the above therapy and oxygen by nasal catheter the patient did not improve

The decision was made, therefore, to give this patient intensive mercurial diuretic therapy, she was given mercuhydrin (2 cc intramuscularly) daily, commencing on the second hospital day At that time she weighed 213 pounds On the fourth hospital day, and after the patient had already lost 25 pounds in weight, a paracentesis abdominis yielded 10,000 cc of pale amber fluid The specific gravity was 1 016, culture and smear were negative, and microscopic study of a "cell block" revealed no unusual cells

Fluoroscopic examination of the heart on the tenth hospital day revealed enlargement of all the heart chambers, particularly evident was the enlargement of the right and left auricles and the prominence of the pulmonary conus

On the eleventh hospital day, and after receiving 10 doses of mercuhydrin (2 cc each), the patient weighed 159 pounds as compared with the earliest recorded weight of 213 pounds on the third hospital day She had lost more than 54 pounds By the thirteenth hospital day, the patient was ambulatory and fairly comfortable, and by the twenty-first hospital day, her weight was stabilized near 160 pounds She had received 19 doses of mercuhydrin parenterally

Since she seemed to have reached a "dry weight," it appeared desirable to decrease the frequency of therapy A trial dosage of 2 cc of mercuhydrin on alternate days was not successful After only six days' trial therapy, the patient had gained four pounds and was again rather dyspneic and uncomfortable As was to be expected, she also complained of pain at the site of injection, 22 of which had been administered.

Since the patient seemed to require 2 cc. of mercuhydrin each day, since pain was a factor in producing discomfort, and since this therapy necessitated continuous daily attendance of a physician, it appeared desirable to try administration of an oral preparation. Auricular fibrillation was present with little or no pulse deficit and with ventricular rate ranging from 60 to 80 per minute

Therapy was then initiated with an oral preparation of mercupurin on the twenty-ninth hospital day At first, when the patient was receiving 0 2 Gm. three times daily, she gained nine pounds in eight days Over a period of two days, the dose was then increased to 0 4 Gm four times a day

Nausea, emesis, and dizziness ensued at first when the total dose of 1 6 Gm. was given in two portions By dividing the daily doses into four portions, these annoying symptoms were eliminated, the patient did not seem to mind micturition "all day and all night" On one occasion, 2 4 Gm. was administered in four divided doses, but nausea and emesis were produced The patient was, therefore, maintained on 1 6 Gm., and in nine days she had lost nine pounds Remarkably enough, her weight continued to decrease and dropped below the level previously considered her "dry weight" while receiving the mercuhydrin intramuscularly

About this time, the forty-eighth hospital day, the patient complained of enlarged and tender cervical lymph nodes and "sore gums" Dental examination revealed carious teeth, calcareous deposit, and gingivitis Routine dental prophylaxis and a hydrogen peroxide mouth wash relieved the gingivitis readily The ammonium chloride was discontinued on the forty-ninth day It is not possible to state definitely whether or not this represented mercurial gingivitis which is more common in people with poor oral hygiene

On the fifty-second hospital day, the patient suddenly developed pain, swelling, and redness in the left lateral epicondylar region The blood uric acid level and x-ray examination of the left elbow were both normal Salicylates offered relief and, in two days, the episode was at an end Whether or not this represented an acute gouty arthropathy secondary to critical diuresis remains speculative

Because the patient's heart was still fibrillating with a ventricular rate ranging from 60 to 100, it appeared desirable to increase the dose of digitoxin to 0 3 mg daily As is evident on the graphic chart, this produced a further and appreciable loss of weight

On the sixty-first hospital day, the patient developed a bilateral catarrhal conjunctivitis which disappeared after use of a penicillin collyrium for twenty-four hours On the sixty-third hospital day the patient had a tooth extracted without complication, penicillin was administered intramuscularly for prophylaxis, prior to and subsequent, to the extraction

For a period of sixteen days, the patient received 0 3 mg digitoxin daily in addition to the intensive oral mercupurin therapy At the end of this period she felt very comfortable with little dyspnea, except on exertion, and was helping to do things about the ward There was no pulmonary congestion or enlarged liver, minimal peripheral edema persisted An ECG at this time revealed a sinus rhythm with a rate of 56, and the patient had lost an additional significant amount of weight, bringing

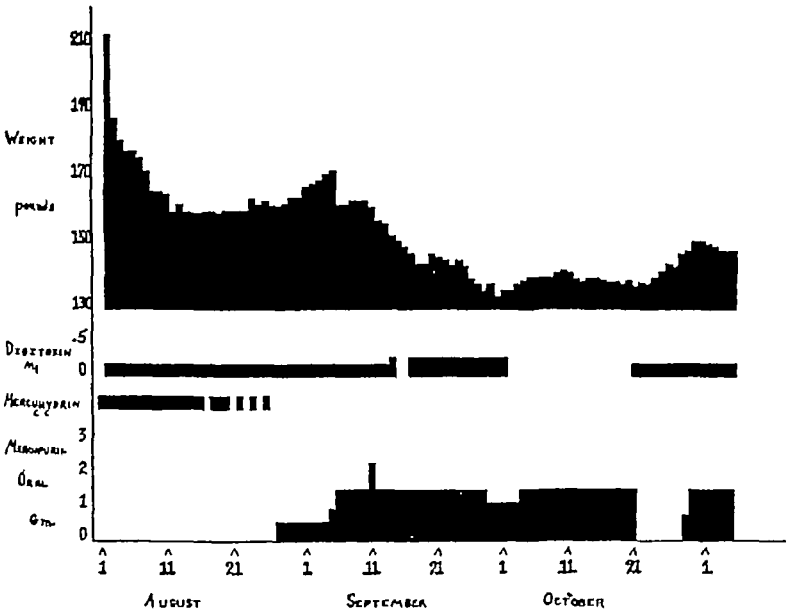

FIG 1

the total weight loss to the neighborhood of 80 pounds in sixty-one days.

Subsequent to this, the patient received no digitoxin but only oral mercupurin, 1 6 Gm. daily for seventeen days. At first, she gained a few pounds, but this leveled off again at approximately the same weight. Clinically she retained her improvement.

On the eighty third hospital day, the patient received 1.2 mg. digitoxin (the last previous dose was nineteen days before) and for the following seven days she received 0.2 mg. digitoxin daily but no mercupurin In this short space of seven days she again became dyspneic orthopneic, weak, and uncomfortable. She had gained ten pounds (Fig 1)

The patient was then given 1 6 Gm mercupurin and 0.2 mg. digitoxin daily until she left the hospital, weighing 145 pounds on the ninety-sixth day

Conclusions

1 Oral mercurial diuretics may be effective in the management of cardiac failure and sometimes may even be more effective than digitalis bodies

2. Oral mercurial diuretics may provide a technic for management of cardiac failure which eliminates the discomfort of repeated injections required with parenteral medication.

3 Oral mercurial diuretics may provide a treatment which eliminates repeated drastic diuresis and freedom from sudden withdrawal of chlorides

4 Causes for failure of oral mercurial diuretic therapy include (*a*) inadequate dosage, (*b*) short period of trial, and (*c*) concentration of doses (causing gastric irritation) rather than division of doses

5 An additional cause of failure may be side effects from other drugs such as digitalis bodies Such effects when attributed to oral mercurial diuretics operate to prevent adequate trial.

6 Studies in the management of acute cardiac insufficiency with parenteral mercurial diuretics may lead to the conclusion that the digitalis bodies may be dispensed with on certain occasions.

7 Oral mercurial diuretics in maintenance dose may be one answer to the question of recurrent cardiac decompensation in patients well digitalized but persistently in mild failure

TOLERANCE STUDIES OF THE ANTIHISTAMINE DRUG THEPHORIN

LINN J BOYD, M D , JONAS WEISSBERG, M D , and THOMAS H MCGAVACK, M D , New York City

(*From the New York Medical College, Metropolitan Hospital, Research Unit, Welfare Island*)

AN ANTIHISTAMINE action has been demonstrated in animals following the administration of Thephorin, a brand of phenindamine (2-methyl-9-phenyl-2,3,4,9-tetrahydro-1-pyridindene hydrogen tartrate) [1-3] As a preliminary step in the use of this material for the control of allergic manifestations in which histamine releases play a part, the general effects of the drug have been observed subjectively and objectively in a representative group of individuals not known to have any allergic disease or clinically recognizable disturbance of the autonomic nervous system

Materials and Methods

Subjects and Their Management —All subjects were ambulatory patients attending a general medical clinic They were selected at random except that all cases with a known allergy or recognizable disease of the autonomic nervous system were summarily excluded During some representative period of the study, usually for one week, each subject received a placebo, identical in shape and appearance with the test material On this basis, a group of subjects was eliminated whose observations were obviously unreliable As the study proceeded, it became clear that in order to avoid confusion, all subjects who, prior to the use of the drug, suffered from dizziness, drowsiness, insomnia, dryness of the mouth, and any of a variety of gastrointestinal complaints should also be barred from the experiment

The remaining subjects were further screened for their ability to cooperate and to make accurate, consistent statements regarding their condition The majority of the patients came to the clinic because of a mild benign hypertension or a low-grade hypertrophic arthritis Effort was made to conceal the fact that we were interested in the "side" effects of the drug by emphasizing the point that the medication was specific for the particular illness of the patient, or nonspecifically directed to "build them up" as would a tonic or vitamin In follow-up visits, leading questions were not propounded, but, after stating how he felt in general, the patient was always asked if any new symptoms had appeared The nature and severity of these were carefully recorded

The patients ranged between seventeen and seventy-nine years of age with an over-all average of thirty-nine years, 50 were men and 50 women

Posology —In all instances, the daily dose of Thephorin* was divided into three equal parts and administered orally Each tablet contained 25 mg of material, and total daily doses ranged from 75 to 600 mg The usual therapeutic doses range from 25 to 150 mg daily, so that our trials are designed to uncover not only possible side effects in usual dosages, but also to determine the trend of side effects, if any, of the largest doses Moreover, these high amounts make possible a weight-for-weight comparison with other well-known antihistamine agents

Interval and Total Period of Observation Observations were made at weekly intervals No subject was observed for less than two weeks, and the majority were observed for four weeks Usually a placebo was administered during the first week, and, if the patient's responses were consistent and reliable, increasing doses of the drug according to the gradually ascending scale noted in Table 1 were employed for one week each However, this order was not always followed, as some patients were utilized at a single dosage level, and others received the placebo after, rather than before, one or more weeks of medication Three subjects were observed at each of the seven dosage levels, while eight subjects were followed for two weeks only

Laboratory Procedures —Urinalyses and complete blood counts were performed on all subjects prior to the initiation of therapy, no patient was included in whom any abnormality was present In approximately 50 per cent of the patients these examinations were repeated at least once during or at the end of the period of treatment with Thephorin Before and at periodic intervals during the treatment of ten patients, the nonprotein nitrogen of the blood was determined and electrocardiographic tracings made In addition, a number of other laboratory tests were performed as indicated by the clinical condition of the individual subject

* Through the courtesy of Drs. Elmer Sevringhaus and W T Strauss generous supplies of Thephorin were made available by Hoffmann-LaRoche Inc

Results

The toxic side reactions following the oral administration of Thephorin are summarized in Table 1. They may be conveniently separated into four categories, namely, those symptoms indicating disturbance in (*a*) the central nervous system, (*b*) the skin and mucous membranes, (*c*) the gastrointestinal tract, and (*d*) the cardiovascular system.

The common neurologic manifestations somewhat in the order of their frequency, included insomnia, dizziness, weakness, numbness, coldness, jumpiness, shakiness, nervousness with increased irritability, and drowsiness (Table 1). The toxic effects upon the skin and mucous membranes were excessive perspiration, dryness of the mouth oftentimes associated with increased thirst and at other times with bitterness in the mouth, and burning or tearing of the eyes occasionally associated with blurring of vision. The most common gastrointestinal symptoms were constipation, abdominal cramps, anorexia, and nausea. Palpitation and flushing constituted the only circulatory disturbances recorded and were observed infrequently.

The most commonly noted toxic symptom was insomnia. Next in frequency, and often first in severity, was dryness of the mouth, sometimes accompanied by an increased thirst. Burning and tearing of the eyes, not unlike that often associated with the ingestion of iodine, and constipation represented the remaining symptoms which were prone to occur at any level of dosage. When 300 mg. or more of the drug were ingested daily, jumpiness, shakiness, and other signs of nervousness were occasionally present (Table 1). When these symptoms were severe, the patients often cried bitterly in recounting their complaints. The other manifestations recorded in Table 1 include all the disturbances of clinical significance that could be attributed to the use of Thephorin in daily doses varying from 75 to 600 mg.

As a rule, untoward symptoms made their appearance in the first twenty-four to forty-eight hours after the administration of the drug was begun. Oftentimes this occurred with the first or second dose, particularly in the case of neurologic manifestations. In contrast, the gastrointestinal symptoms such as constipation, might not make their appearance until the fourth or fifth day after treatment had been instituted.

Toward some of the symptoms produced by the drug it seemed possible to establish a tolerance through continued use. This was particularly true of the insomnia and other manifestations of a presumptively nervous origin. With daily doses of 225 mg. or less such symptoms usually disappeared after several days without altering the amount of the drug administered. On the other hand there were symptoms, notably the dryness of the mucous membranes and the gastrointestinal disturbances, for which no tolerance could be established, regardless of dose.

Urinalyses, complete blood counts, electrocardiographic tracings, and blood nonprotein nitrogen determinations performed at weekly intervals in each of ten subjects for four weeks or more, showed no alterations directly related in any way to the influence of the drug.

From Table 1 it will be observed that the incidence of toxic symptoms was roughly proportional to the daily dose of Thephorin. With amounts of 300 mg. or less 25 per cent of the subjects showed some toxic reactions. With larger doses side effects were encountered in from 50 to 75 per cent of all subjects. In doses of 300 mg. or more daily, the untoward symptoms associated with the use of the drug were occasionally so severe that the subject discontinued the drug voluntarily.

It has seemed advisable to compare the inci-

TABLE 2.—INCIDENCE OF UNTOWARD SYMPTOMS FOLLOWING THE INGESTION OF SEVERAL ANTIHISTAMINE AGENTS

Agents	Per Cent Reactions at Daily Dose 150 Mg	300 Mg	450 Mg.	600 Mg	Outstanding Symptoms
Thephorin	24	50	58	75	Insomnia and drying of mucosae
Benadryl	64	78	76	91	Drowsiness
Pyribenzamine	64	64	73	66	Drowsiness nausea, anorexia, abdominal bloating

dence of unpleasant reactions caused by Thephorin with those of the now well-known antihistaminea gents, benadryl and pyribenzamine This is done in Table 2 The data for all three drugs were collected in similar fashion by the same observers, and at least 30 per cent of the subjects were used in all three trials It will be observed that at levels of 150 mg daily, which is the commonly indicated dosage, Thephorin is less than one-half as toxic as either of the other drugs mentioned At the highest levels of dosage, this difference was less marked, and the number of subjects forced to discontinue the antihistamine agent because of the severity of the symptoms was approximately the same in all three instances

Summary

1 Thephorin was given orally to 100 selected subjects in daily doses varying from 75 to 600 mg for periods of one week or more All symptoms of any nature whatsoever, not present prior to the administration of the drug, were recorded as due to its activity Data from subjects with intercurrent disease were discarded

2 The most frequently observed unpleasant manifestation of the action of the drug was dryness of the mouth, which occurred in 22 per cent of the patients but was more marked at higher than at lower levels of dosage In smaller doses, 300 mg daily or less, insomnia was the most common manifestation noted in 21 subjects This tended to decrease in severity as administration of the drug was continued

3 In all, 42 of the 100 subjects developed one or more toxic symptoms while taking Thephorin

4 The use of Thephorin for four or more weeks in the range of dosage above mentioned was not associated with any significant changes in the electrocardiogram, the nonprotein nitrogen of the blood, the peripheral blood count, or the urine

Conclusion

When compared with other drugs that have an antihistamine effect, namely, benadryl and pyribenzamine, Thephorin is less toxic weight-for-weight in daily doses ranging from 150 to 600 mg

A NEW DRUG FOR THE ALLEVIATION OF PAIN

A new drug, made available in this country after World War II, has been found effective in the alleviation of many kinds of pain, according to an article in the April 13 issue of the *Journal of the American Medical Association*

The drug, which was given the nonproprietary name of methadon, is described by Elizabeth B Troxl, M.D , of the department of pharmacology of the University of Minnesota Medical School Clinical trials were instituted at the University of Minnesota Hospital on 400 patients for relief of all types of pain

By all routes of administration it was found that the average duration of action was from three to eight hours, with many of the patients obtaining relief for as long as eight to twelve hours The effects on the nervous, circulatory, and respiratory systems were similar to those of morphine

Investigators have found that methadon is more potent than either morphine or merperidine, and that in former morphine addicts the abstinence symptoms from morphine could be controlled with methadon

When methadon was withdrawn abruptly after prolonged administration, the symptoms were so mild that treatment was not necessary

Approximately 20 patients receiving methadon for two or three months had no withdrawal symptoms on abrupt discontinuation of treatment Three patients were given the drug for one year and were able to stop treatment abruptly without ill effects

Dr Troxl says that it was possible to use methadon to relieve muscular spasm and pain in patients with bulbar and spinal poliomyelitis and that it also was used effectively to relieve headaches due to brain tumor, head injury, and brain abscess

RECTAL POLYPS SHOWING EARLY MALIGNANT TRANSFORMATION

HENRY PERKIN, M D , New York City

POLYPI are frequently found in the course of routine proctologic examinations The patient may seek medical advice because of bleeding which, on examination, is found to be due to a polyp At times the complaint is protrusion on straining at stool, and, on examination, instead of hemorrhoids, a pedunculated polyp is seen A great many polyps, however are discovered during sigmoidoscopy performed as part of a routine examination for other diseases of the terminal portion of the intestinal tract.

The literature on this subject is extensive Bensuade, Hillemand, and Augier, Lockhart-Mummery, J C Lawrence, Manheim and Druckerman, W J Martin, and Manheim are a few among the many who have stressed the frequency of malignant degeneration of so-called benign polyps of the rectum [1–6]

It is obvious, therefore, that a biopsy is absolutely essential when any type of polypoid lesion is discovered on proctosigmoidoscopic examination The biopsy report will usually place the lesion in one of three groups, which are as follows (1) simple adenomatous polyp, (2) adenomatous polyps showing (*a*) increased mitosis (*b*) atypism, or (*c*) cellular dedifferentiation and (3) adenoma malignum.

The adenoma malignum is a frankly malignant lesion Its treatment is generally surgical and not *pertinent to this discussion* Polyps of the first two groups can be treated if they are accessible to the sigmoidoscope. If they are not, laparotomy is necessary Three cases illustrating the problems involved, are presented

Case Reports

Case 1 —A 59-year-old white man presented himself with a one-year history of protrusion at the anus and occasional, slight rectal bleeding On straining, he was found to have internal prolapsing hemorrhoids On digital examination, the examining finger detected a mass on the right rectal wall Sigmoidoscopy revealed this to be approximately 3 cm. in diameter and attached to the right wall of the rectum about 11 cm. from the anal orifice Inasmuch as the hemorrhoids were not bleeding this mass accounted for the bleeding about which the patient complained. A biopsy was performed and the pathologic report [illegible] specimen consists of fragments of an adenomatous polyp The polyp was fulgurated several times and four weeks later another biopsy was taken for examination. This second specimen was reported as fragments of villous adenoma showing focal early malignant transformation.

Case 2 —Another patient, also a white man, aged 64 was referred for proctologic examination because of a seven months history of diarrhea consisting of from two to six bowel movements each day The stools were usually quite loose, and a small amount of blood was occasionally noticed A barium enema had already been done and had been reported as showing diverticulosis and diverticulitis On sigmoidoscopic examination a polypoid mass was discovered on the left wall of the rectosigmoid approximately 10 cm. from the anus. It was about 2½ cm. in diameter and fairly smooth in outline The angulation of the rectosigmoid at this point rendered a complete view of the polyp almost impossible A portion was obtained for biopsy however and was reported as "adenomatous polyp Fulguration of this polyp was begun Four weeks later a second biopsy was taken and this time the report on it was "rectal polyp (papillary adenoma) with carcinomatous degeneration invading the submucosa and muscularis '

Case 3 —This patient was a 62-year-old white woman who complained of rectal bleeding, slight in amount, for a period of six months Bleeding occurred only on defecation On sigmoidoscopy a pea sized polyp was seen 7 inches from the anus. This was biopsied and it was reported to be an adenomatous polyp showing mitosis and nuclear atypism. The polyp was fulgurated The patient continued to bleed from a higher point. A barium enema was done and the presence of a polyp in the upper sigmoid was reported Sigmoidoscopy was repeated, and a polyp was found about 10 inches from the anus. A portion of this was removed with a cautery snare and the biopsy report was adenocarcinoma of infiltrating tendency within a fragment of rectal polyp In view of the fact that this polyp was only noticed on one of several sigmoidoscopic examinations it was felt that the polyp reported by the roentgenologist was the same as that which was biopsied. Accordingly laparotomy was suggested for the removal of this polyp At operation a polyp approximately 2 cm. in diameter on a short, broad pedicle was found high up in the sigmoid colon.[7] This was removed by sigmoidotomy The pathologic report revealed the polyp to be an adenoma, in one portion of which carcinomatous changes had occurred. It was from this portion that the biopsy had been taken

At the time of the first biopsy in the first two cases surgery involving opening of the gut or resection was obviously too drastic a procedure for the treatment of a benign lesion. Fulguration in stages was safe and thoroughly adequate. However, when the later biopsies were done, the diagnosis of 'early malignancy" replaced that of "benign polyp ' Accordingly the patient was

referred for hospitalization and radical resection In the last case, after one polyp had been destroyed by fulguration and the second had been found on sigmoidoscopy only as a result of a partial intussusception, surgery was obviously the only possible treatment

Thus we see that an exact histologic diagnosis of rectal polyps is of the utmost importance Simple fulguration can effect a complete cure in benign lesions However, it would prove a fatal blunder in the treatment of those in which malignant degeneration has already occurred, for the malignancy can advance and metastasize in the latter, while the surface of the polyp is blithely being fulgurated

Will the choice of a particular site in taking the biopsy solve this problem? No It has been claimed by some that the transition from simple adenoma to carcinoma always starts at the tip of the polyp Others have been equally certain that this change begins at the base The more recent work of Helwig shows beyond all doubt that no definite pattern can be established [8] Carcinomatous changes may occur at the tip, margins, near the stalk, or at the base of a polyp In addition, it must be remembered that, histologically, no particular group of adenomas can be expected to maintain a constantly benign course If the complete destruction of a polyp cannot be accomplished in one or two treatments, then, as the base of the polyp is approached, repeated biopsies must be done

At the present time, the tremendous campaign for the early diagnosis of cancer is bringing us more patients for early examination and treatment If the end results of surgery for carcinoma of the rectum and rectosigmoid are to be improved, we must remember at all times that the benign polyp of the rectum is potentially a malignant tumor

SAYS CONVICTS DISPLAY PSYCHOSOMATIC NEEDS

Family tension, even of a subtle nature, breeds physical and mental ills and may develop children into criminals, says Dr David Abrahamsen of Columbia University's psychiatry department Having made a four-year study of convicts, Doctor Abrahamsen declares that half the prisoners had psychosomatic disorders, including symptoms of cardiac, neurologic, skin, and respiratory diseases These he links with evidences of anxiety, envy, cruelty, and lack of affection "In all the families examined," he says, "there was an emotional tension This was found to be a breeding place for hostility and resentment"

TEACHING AND RESEARCH FELLOWSHIPS IN TUBERCULOSIS

Establishment of a number of teaching and research fellowships in the field of tuberculosis by the National Tuberculosis Association has been announced by Dr Esmond R Long, director of the NTA's Division of Research. The action was recommended by the executive committee of the NTA's Medical Section, the American Trudeau Society

Annual stipends for the fellowships will range from $2,400 to $3,200, according to Dr Long Provision will also be made for laboratory fees and incidental expenses of like character

The fellowships will be limited to graduates of American schools for teaching and investigation in the United States While preference will be given to applicants with a Doctor of Philosophy or Doctor of Medicine degree, fellowships will not be restricted to the holders of these degrees

Applications will be considered in the fields of pathology and bacteriology, clinical medicine, epidemiology, and social and statistical research Applicants may elect the institutions in which they wish to study

Persons interested in obtaining a fellowship should write to Dr James E Perkins, managing director, National Tuberculosis Association, 1790 Broadway, New York City 19, for further information

X RAY INJURIES THE PREVENTABLE OCCUPATIONAL HAZARD

SHIRLEY J DEVOE, M D , and GEORGE M CORNEY, B A , Rochester New York

(From the Iola Sanatorium and the Eastman Kodak Company)

IN A recent survey of the vocational ailments suffered by physicians, x ray injuries are listed third This is a deplorable situation The early victims of x rays are justly honored as martyrs to their science Most of the recent victims are, to put it as bluntly as possible, fools. In this day there is practically no excuse for any one being injured by x rays or radium. The means of protection are known, standardized, and easily available.

The great majority of x ray installations today are just as safe as designing can make them The injuries arise from ignorance, carelessness, or haste In many cases the safer procedure is the longer one. The dangerous attitude is that "just this once won't matter" Just once does not matter, but a careless habit does

Potentially, the most dangerous x ray procedure is fluoroscopy A lead apron and lead gloves are clumsy, hot, and heavy but fluoroscopy should *never* be done, even once without them. The pleasures of being deft cool and unburdened should not be associated with the use of a fluoroscope The main danger is not the direct beam which produces the image, for that is effectively stopped by the lead glass covering the fluoroscopic screen The hazard lies in the x rays scattered by the body of the patient. If an assistant habitually stands at the doctor's elbow to observe or make notes, he too should wear an apron, since his exposure to the scattered x-rays may be as great as or even greater than the physician s

Above all, never palpate directly with the hand or operate under the fluoroscope, even when wearing lead gloves, except in extreme emergencies When it is essential to manipulate under the fluoroscope, the beam should be reduced to strike as small an area as is practical, and the hands should be kept outside the irradiated area as much as possible The lead contained in a glove is sufficient protection from the scattered radiation but cannot be relied upon to protect from the direct beam Thus is particularly true if the gloves are old or cracked If the lead glass covering the fluoroscopic screen needs replacement, it should be done by the company that supplied the fluoroscope In that way it is certain that lead glass of the proper protective value will be used

Radiography is far less dangerous than fluoroscopy yet offers several excellent chances for making costly mistakes It is the doctor's moral responsibility to see that his technician follows safe practices Neglect of the moral responsibility may lead to a financial one

Both doctor and technician should avoid the direct x ray beam from the tube In addition both should avoid the radiation scattered from the patient the equipment and the walls or floors The control stand should be in an adequately protected enclosure in which the technician should remain during the course of the exposure This is particularly important in large busy x-ray departments and in mass x ray surveys which are frequently conducted in surroundings not designed for radiography In addition the second technician, usually employed in mass surveys to position the patients, should always retire behind a protective screen or enclosure during the course of the exposure In mass surveys it may also be necessary to look to the protection of clerical personnel whose desks may be near the x ray apparatus.

A point often overlooked arises in the radiography of children or other patients unable to cooperate If it is necessary to hold the patient, this should never be done by the doctor or the technician The person accompanying the patient should be instructed in how to hold him in position the reason being of course, that the layman is very rarely exposed to x rays and has a correspondingly remote chance of developing injuries The time consumed in instruction and the occasional film wasted are of less significance than the possibility of x ray damage to the hands of the physician or technician

X ray equipment at least has the advantage of a formidable appearance, which keeps the need for safe practices constantly in the mind of the user Radium lacks this advantage The extreme simplicity and silence of the apparatus lulls the observer This coupled with the fact that radium cannot be turned off but instead gives out radiation day and night without interruption makes it a great source of potential danger It also requires that thought be given to the storage of radium as well as to its use.

As to the storage of radium, tables have been prepared giving specifications for lead storage containers for various amounts of radium. The only protection problem in storing radium, then is to follow existing recommendations meticulously In the use and handling of radium prepa-

rations, the protective recommendations can be summed up in a few words—*Keep your hands away!* No radium needle, capsule, or applicator or no radon seed should ever be handled directly, either with the bare hands or with lead gloves All manipulations should be done with long tongs or forceps, clumsy though they may be If considerable work is to be done, such as the threading of several radium needles at one time, a heavy lead shield should be used, containing a thick lead glass window for observation The shield should be large enough to protect the body and head of the operator, who reaches around it on either side to perform his manipulations with tongs or forceps

To transport radium in a hospital, a case or small cart having a heavy-walled lead container should be provided The case or cart should have a handle at least three feet long The design should be such that it is impossible, or at least inconvenient, to convey the case or cart other than by the handle If radium is habitually carried in an automobile, it should be stowed as remotely as possible from the driver and passengers

Safety against x-ray or radium implies, of course, a safe installation There is no need here to discuss the details of design and construction of x-ray facilities The information is available from architects familiar with hospital design and from many publications such as the Bureau of Standards Handbooks, Handbooks 20 and 23, *X-ray Protection* and *Radium Protection*,* and the American Standards Association's *Safety Code for the Industrial Use of X-rays* † The latter, although directed toward the requirements of industrial radiography, contains a compilation of the most recent information on the protection of personnel from x-rays and gamma rays In addition, application to either of the radiologic societies will provide a list of physicists competent to advise on matters of measurement of and protection from radiation A final point, sometimes overlooked in the installation of x-ray equipment, is the innocent bystander in the next office or the floor below It is quite possible for an x-ray machine to be entirely safe for those using it and yet be a menace to a neighbor

Some means to measure, or at least to check occasionally, the radiation received by the personnel of an x-ray department is advisable One good method is the use of small ionization chambers which will total up the radiation received over a period of time These look much like fountain pens and are carried during working hours At the end of each day, or some other convenient period, each is checked to see how much radiation it has received Ionization instruments are also available which will give a quick indication of the stray radiation at any point

If ionization equipment is not continuously available, rough checks may be made with x-ray film The packets used for dental radiography are convenient A dental film is carried by each member of the department for a certain time, and then developed If possible, calibration films which have been exposed to known amounts of radiation should be developed simultaneously Information on films suitable for this purpose may be obtained from the manufacturers

Tests such as these serve the double purpose of checking on the adequacy of the protective measures and on the safety habits of the department personnel An indication of excessive exposure should be cause for an investigation of the protective measures and of the conduct of the personnel

In dealing with x-rays or radium, remember that lead is cheap, and time is cheap, a physician's hands and health are priceless

FELLOWSHIPS IN PUBLIC HEALTH AVAILABLE THROUGH THE NEW YORK STATE DEPARTMENT OF HEALTH

Dr Herman E Hilleboe, New York State Health Commissioner, announces the availability of fellowships for young physicians interested in entering public health as a career The fellowships are for a period of two years or less, depending upon the qualifications of the applicant Both field training and academic training leading to a degree of Master of Public Health are given during the period of the fellowship, which carries with it a stipend of $3,600 per year In addition, necessary travel and other expenses are paid as well as tuition at a school of public health

Application blanks and further information may be obtained by writing to Dr Franklyn B Amos, New York State Department of Health, Governor Alfred E Smith State Office Building, Albany 1

SEVERE DIABETIC ACIDOSIS WITH EXTREME LOW CARBON DIOXIDE COMBINING POWER

JOSEPH C WATTS, M D A J AFTAKER, M D , and JAMES R REULING, M.D , F A C P
New York City

(From the Department of Medicine, Queens General Hospital)

IN DIABETES any conditions accelerating the loss of glycogen from the liver, such as endocrine disturbances, infections, anesthesia, or vomiting, will contribute to the development and severity of diabetic coma Glycogen starvation of the liver without diabetes as observed in fasting and intense hyperthyroidism never produces a condition resembling diabetic coma It is only when insulin deficiency is present that glycogen impoverishment of the liver becomes an important element in the clinical status

Case Report

R. G a Negro married housewife, aged 34 was admitted in coma to the Queens General Hospital at 7 20 A.M on January 6 1947 She had been found unconscious three hours previously

The history revealed that she had noted weakness nervousness polyuria polydipsia and weight loss for four months. One month before admission she was seen in her home by a physician because of 'collapse and was told she had 'blood pressure elevation to 180' No urine analysis was done She was given varied colored tablets for weight reducing. It was ascertained that one of these contained 1 grain of thyroid and 5 mg of amphetamine sulfate others contained atropine sulfate and phenobarbital. This medication had been taken by the patient for the month prior to admission

Her menses had been on the twenty-eight day cycle, five-day flow type until two weeks after starting these medications when she had a one-day period

Physical examination on admission showed an obese, Negro woman in deep coma with Kussmaul breathing and an acetone odor of the breath. Her skin was dry and cool the pupils were in middilation and responded sluggishly to light. The fundi were normal, lips were dry tongue parched. There was no nuchal rigidity The neck vessels showed no distention, nor was there any thyroid enlargement. The breasts were large no masses felt. The lungs were resonant throughout. The heart sounds were distant but regular in rate and rhythm no murmurs were heard The abdomen was soft. The deep reflexes were hyperactive although no pathologic reflexes could be obtained. Temperature was 98.6 F pulse 136 respirations 30 A catheterized specimen of urine showed a 4 plus glucose and 3 plus acetone The blood taken on admission was reported at 9 30 A.M as containing 1 100 mg. per cent glucose and carbon dioxide combining power 3 volumes per cent. It was believed that there had been an error in determining the carbon dioxide combining power and additional specimens were immediately taken. Two independent tests were performed and both showed a carbon dioxide combining power of 3 volumes per cent

The laboratory data were reported as follows *urine analysis specific gravity* 1 026 *pH* 6.0 3 *plus* albumin occasional granular casts and few white and red blood cells. Blood count revealed hemoglobin 81 per cent red blood cells 4,200 000 white blood cells 12 000 and 65 per cent polymorphonuclears Additional laboratory reports are shown in Table 1

During the first twelve hours the patient received 1,000 cc. normal saline solution 4 000 cc. Hartman s buffered lactate solution 75 Gm. of glucose and 1 600 units of intravenous insulin

TABLE 1 —LABORATORY REPORTS DURING FIRST TWELVE HOURS (JANUARY 6 1945)

Time	Blood Sugar in Mg. Per Cent	Carbon Dioxide Combining Power Volume Per Cent	Urine Glucose	Urine Acetone
9:30 A.M.	1 100	3	4 Plus	3 Plus
12 Noon	789	5	4 Plus	3 Plus
2 10 P M	593	5	4 Plus	3 Plus
3 30 P.M.	420	4	4 Plus	3 Plus
4:30 P M	315	12	4 Plus	4 Plus
6:30 P M	162	13	3 Plus	2 Plus
8 00 P M	123	16	1 Plus	2 Plus
9 00 P M	97	19	0	1 Plus

During the second twelve-hour period 2 500 cc of 5 per cent glucose in saline was given with 100 mg each of cevitamic acid and thiamin chloride The urinary output was 100 cc. during the first twenty four hour period

On the second day January 7 2,000 cc of 5 per cent glucose in normal saline and 2 000 cc. of Hartman s solution were administered as well as 100 units of insulin The blood sugar was 210 mg. per cent, and the carbon dioxide combining power had risen to 24 volumes per cent Signs of renal irritation continued with albuminuria and cellular elements in the sediment the output of urine increasing to 1 200 cc. The urea nitrogen was 34 mg per cent, serum chlorides 99 mg. per cent (normal 570) serum protein 7.6 per cent, hematocrit 45 volumes per cent. The temperature was 102 F at 8 00 A M but dropped to normal at noon and remained normal thereafter The patient was less hyperpneic but had not yet roused.

The carbon dioxide values fluctuated during the first two days but rose to 44 volumes per cent on the third day The patient became alert and responsive with a blood sugar of 235 mg per cent urea nitrogen 20 mg. per cent, and blood cholesterol 220 mg per cent A Kline test taken this day and one five days later were both reported as negative Blood pressure was 128/82

During the next ten days the glycosuria gradually diminished on a diet of 150 Gm of carbohydrate, 80 Gm of protein and 60 Gm of fat with crystalline insulin between 90 and 110 units daily in divided doses After ten days, the insulin was further reduced to 35 units of protamine zinc and 15 units of crystalline taken together in the morning From the tenth to the thirteenth day there was moderate ankle edema On the eighteenth day the insulin was stopped with no glycosuria, the blood sugar value then was 95 mg per cent Gynecologic examination was essentially normal Blood cholesterol on January 25 was 190 mg per cent Urine tests were normal Blood pressure was normal

On the twenty-second day of her hospital stay, the patient signed her release and left before further investigation could be completed No further contact was made with her

Discussion

This case has several points of interest It is reported primarily because of the extremely low carbon dioxide combining power Speculation as to the cause of the acidosis on the one hand and the high blood sugar level with prompt and seemingly complete recovery are of added interest No infection could be detected It is noted that this patient had been taking thyroid substance, 3 grains daily for about one month According to Means, thyroid substance inactivates insulin [1] He states further that "hyperthyroidism unquestionably aggravates diabetes mellitus" There is evidence that total thyroidectomy ameliorates diabetes [2,3] Means cites a case with both myxedema and diabetes mellitus [1] The administration of thyroid relieved the myxedema and intensified the diabetes When the patient was again allowed to become myxedematous by the omission of thyroid substance, the diabetes became milder Indeed, when fully myxedematous, the patient had no recognizable diabetes On resumption of thyroid, the diabetes returned

The feeding of thyroid substance mobilizes body glycogen Barnes showed that thyroid-fed dogs with both the pituitary and pancreas removed, did not intensify their mild glycosuria [4] The heart rate was increased, but the polyuria and diarrhea, usually observed with thyroid feeding, did not occur By injection of pituitary extract, a severe glycosuria could be produced Barnes' "working hypothesis" then was that the thyroid may exert an influence upon carbohydrate metabolism through the pituitary, which in turn may influence the adrenals

Houssay diminished or abolished diabetes mellitus by removing the pituitary gland in pancreatectomized dogs [5] He showed that pituitectomy caused hypersensitivity to insulin and that the severe diabetes caused by pancreatectomy can be reduced to a mild form by pituitectomy Long removed the thyroid in pancreatectomized animals to see if it would have a similar effect [6] Ketosis was diminished, but the diabetes mellitus was not affected Removal of the adrenals, however, had the same effect on pancreatic diabetes as pituitectomy Long believes that through its corticotropic hormone the anterior pituitary increases the production of carbohydrate from protein, the cortical hormone being necessary in the action The evidence for this is that a Long cat (pancreas and adrenals out) will live as long as a Houssay dog (pancreas and pituitary out) However, a Houssay dog will have a return of diabetes when given anterior pituitary hormone, a Long cat will not

Woodyatt says, "glycosuria associated with hyperglycemia is a common accompaniment of various endocrinopathies with various gland extracts (pituitary, adrenal thyroid)" [7] He did not cite ketosis

The casual relationship between the ingestion of thyroid substance for a certain period and the pathology found in this patient is not absolute The hyperglycemia and ketosis caused in this case were severe (1,100 mg per cent of glucose, 3 volumes per cent carbon dioxide combining power, and serum chlorides 99 mg per cent)

Even though the evidence of direct and specific hormonal antagonism between the thyroid and pancreatic islets seems impressive, it is not conclusive [1] A common cause for diabetic acidosis in a patient receiving thyroid substance is the direct effect of thyroid extract on the adrenal gland itself Reifenstein says that in animals a considerable enlargement of the adrenals occurs, and, in all probability, this results in an increase in the production of adrenal cortical steriods of the type that cause conversion of protein to carbohydrate [8] This type of hormone is found in excess in Cushing's syndrome where one has insulin-resistant diabetes [9] Our patient was moderately insulin-resistant and required large amounts of insulin

At the same time, one cannot exclude the possibility that the thyroid increased the amount of glycotropic hormone or that it aggravated the diabetes nonspecifically by increasing the metabolic rate, similar to that caused by infections This metabolic rate rise increases carbohydrate requirements and overworks the already incompetent pancreas

The treatment followed modern standard methods It is beyond the scope of this paper to discuss the therapy of diabetic acidosis and acid-base relationships Further follow-up of the case was not accomplished One would have desired basal metabolic readings, glucose and insulin tolerance curves, further blood cholesterol determinations, menstrual cycle history, and pregnancy tests among other details

Summary

An obese, adult Negro woman was seen and treated after the abrupt onset of diabetic acidosis following ingestion of 3 grams of thyroid extract daily for about one month Her acidosis was severe The repeated carbon dioxide combining power readings were below those usually considered compatible with life, but she recovered promptly following large doses of electrolytes and insulin

MARSHALL SAYS WORLD CANNOT ISOLATE DISEASE

Medical isolation in the modern world is as impossible as political or economic isolation, Secretary of State George C. Marshall said at the opening session of the International Congresses on Tropical Medicine and Malaria.

Mr Marshall said these diseases presented an international problem that 'should be solved by a pooling of the genius and the resources of many nations.

In modern life, he told delegates from 41 nations 'there is no way we can escape the consequences of each other s mischief or misfortune.

Marshall told the delegates that since their last meeting at Amsterdam in 1938 the world has been subjected to another terrible ordeal of war which had threatened to cancel mankind s progress in medicine

"Seldom are we able to get at the remedy for the mass misery that develops discontent misunderstanding and violence' he said 'That is your particular province in which you labor as benefactors of mankind.

Mr Marshall said the conquest of diseases and the maximum production of foodstuffs on lands not now very productive are tremendously important requirements of the world situation. Tropical regions he added hold the key to both necessary advances

'Little imagination is required, ' he continued 'to visualize the great increase in the production of food and raw materials the stimulus to world trade and above all the improvement in living conditions with consequent social and cultural advances that would result from the conquest of tropical diseases

SCIENTIST OFFERS NEW HOPE FOR PAIN RELIEF

Introduction of "new and powerful analgesics for pain relief' were cited as examples of progress in American synthetic medicinal research by Dr C M Suter, director of the chemical division of the Sterling Winthrop Research Institute, Rensselaer New York. He was addressing a sectional meeting of the American Chemical Society in Akron Ohio

Dr Suter pointed out it has been almost ten years since the discovery of the first powerful analgesic, now in wide use under the common name of meperidine and the trade name Demerol for control of serious pain of a variety of types.

Reviewing recent advances in medicinal research, Dr Suter declared that since the war it has assumed a more diversified aspect and is again directed chiefly toward the health problems of this country rather than those of foreign areas.

"Most of the recent progress, as measured by new drugs just announced and those in prospect has been in the development of products having pharmacodynamic rather than chemotherapeutic action, ' he said.

'In other words, this means new drugs useful in alleviation of discomfort or control of pain, rather than the cure of diseases caused by pathogenic organisms

"The manufacture and introduction of new drugs, except for the most critical items was not possible during the war period because of the shortage of manufacturing and packaging materials.

Therefore new synthetic medicinals are now appearing on the market, which represent the development of discoveries made during 1940–1945 " Dr Suter concluded

PHOTOSENSITIZATION THERAPY OF ACNE VULGARIS

ABNER KURTIN, M D , New York City, and REUBEN YONTEF, M D , Bayonne, New Jersey

IT IS A banal observation that the majority of patients with acne vulgaris enjoy a partial or complete remission of their disease in the summer months "The sun is good for my skin" is a remark frequently made by acne sufferers This phenomenon led us to a new approach in the treatment of acne The purpose of this therapy is to photosensitize the involved skin and thus enhance the beneficial effect of ultraviolet radiation

For the past five years we have experimented with various known light sensitizers, alone and in combination, in an effort to create an ointment which would be effective in the treatment of acne

The final effective formula which we have used is as follows

Crude coal tar	5 per cent
Sulfur	5 per cent
Sulfathiazole	5 per cent
Lanolin,	
Lassar's paste, equal parts ad	

The patient is instructed to apply this ointment to the diseased areas every night and to remove it in the morning with the help of soap and water or sulfonated oil Unfortunately, the ointment is black and lacks cosmetic elegance It will stain bed linen, and the patient should be advised of this fact It takes approximately one week for the skin to become sensitized A few minutes' exposure to bright sunlight is then sufficient to cause a burning sensation which in a few hours will be followed by an erythema The patient's threshold of pain tolerance is an adequate safety valve in the prevention of overexposure The skin will tan rapidly and in a few weeks the tolerance to ultraviolet becomes normal

A slight increase in pustulation may be seen during the first week Therapy should be continued This effect is temporary and perhaps of value in the elimination of comedones Within ten days a marked improvement is noted, and by the end of the fourth week a majority of the patients have a satisfactory clearing of the skin.

It has been our custom to fortify this treatment with weekly exposures to ultraviolet light This is of added importance in the winter months when adequate exposure to sunlight is not possible The sensitized skin will react violently to the standard erythema dose It is prudent, therefore, to begin at one half the usual exposure and increase the dosage cautiously each successive week Manual removal of comedones after the second week of therapy will expedite healing

It is of interest that coal tar has a beneficial effect on acne, despite the fact that it is an agent capable of producing acneform lesions if applied for an adequate length of time We have rarely continued our patients on this treatment for periods longer than one month and at no time have had such a sequel from the use of the tar

Sulfathiazole ointment, when used alone, does not have any demonstrably curative effect in acne We think that it works in this combination as a synergistic photosensitizer and that the bactericidal properties play a very small part In our experience, sulfathiazole is not capable of producing contact dermatitis when used on unbroken skin The above formula has been used on approximately five hundred patients without causing dermatitis of the contact type The disease may recur after several months It may then be kept under easy control by occasional applications of the ointment

We have reviewed the results in our last 100 treated cases (Table 1) This represents an unselected group of varying ages and degrees of acne Many had been treated unsuccessfully in the past with x-rays

The above series of cases was treated by us in private practice A much larger series was treated equally successfully by us as Army dermatologists, and several practicing dermatologists have confirmed our opinion as to the efficacy of the above preparation

No therapy yet reported has given this uniform and predictable result A small group of acne rosacea, infective eczematoid dermatitis, and sycosis barbae cases has responded to this ointment In an effort to eliminate the disagreeable black color we are now substituting the various photosensitizing tar fractions

TABLE 1 —RESULTS IN LAST 100 TREATED CASES

VALUE OF UROGRAPHY IN ELUCIDATION OF NONUROLOGIC COMPLAINTS

ALLAN K SWERSIE, M D New York City

(From the Urology Department of the New York Polyclinic Medical School and Hospital)

THERE is considerable variety in topographic and symptomatic manifestations of visceral disease. A confusing factor in localizing pathology is the existence of common routes of sympathetic innervation for the kidneys and the abdominal viscera. The renal organs derive their nervous supply from parts of the solar plexus and the aortic renal ganglion, to which centers are distributed filaments from the splanchnic nerves. These nerves also supply branches to important organs in the abdominal cavity. Outstanding symptoms of diseases of the urinary tract above the level of the bladder are such complaints as indigestion, eructations, nausea, vomiting, and distention. An extremely high percentage of patients proved to be suffering with renal or ureteral disease, particularly on the right side, display abdominal scars incident to operations on the appendix, gallbladder, uterus or adnexa. Before some chance posterior localization of pain or positive urine findings focus attention upon the urinary tract, the multiple complaints of the patient often result in many losses of viscera with disappointments about obtaining relief. The continued frequency of major maldiagnoses of this type warrants periodic emphasis on some points of general knowledge which should enhance our success in early recognition of the true pathology.

Failure to find pathologic elements in the urine does not preclude existence of urinary tract disease. For example, an uninfected hydronephrosis will give a normal urinary picture, and entrance of urine from an infected kidney pelvis often is barred by tight closure of the ureter.

When gastrointestinal studies fail to reveal obvious findings to account for complaints referable to that system an intravenous urogram should be done. This procedure performed with the customary caution is relatively innocuous and may give the clue to diagnosis, either by revealing intrinsic urinary system disturbance or by revealing anatomic displacement, or distortions of kidney, ureter or bladder shadows may suggest neighboring disease.

Case reports illustrative of the value of the urogram in such instances follow.

Case Reports

Case 1.—The patient was a young married woman, 34 years of age. Urologic investigation was initiated by a casual remark by her nephrectomized husband that very likely his wife's troubles (diagnosed as gallbladder disease) were of kidney origin too. The story was one of ten years' duration of frequent right upper quadrant seizures of pain with gastric upsets. X-ray study of the gastrointestinal tract and gallbladder were negative, and treatment prescribed on the basis of a chronic cholecystitis had been unsatisfactory. Intravenous urography in a symptom-free interval revealed a mild right-sided hydronephrosis due to constriction at the ureteropelvic level and a normal left kidney (Fig. 1). The patient was prevailed upon to undergo cystoscopic study and on filling the right kidney pelvis with 40 cc. of fluid, the "gallbladder" symptoms reappeared.

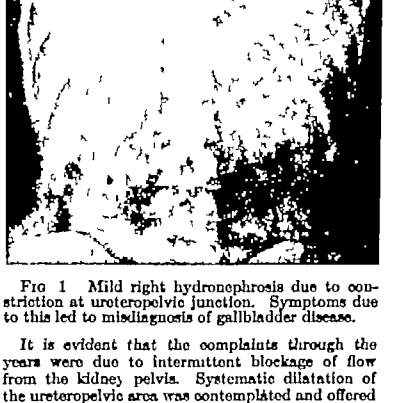

FIG. 1.—Mild right hydronephrosis due to constriction at ureteropelvic junction. Symptoms due to this led to misdiagnosis of gallbladder disease.

It is evident that the complaints through the years were due to intermittent blockage of flow from the kidney pelvis. Systematic dilatation of the ureteropelvic area was contemplated and offered to the patient as a conservative measure to improve drainage to be followed by surgery if unsuccessful. She, however chose to revert to the original diagnosis of gallbladder disease and its more comfortable therapeutic regime. She seems to be a good candidate for eventual nephrectomy.

Case 2.—The patient was a 30-year-old man complaining of intermittent terminal hematuria with suprapubic and scrotal pains for two weeks. For about two months previous, the patient had been suffering from an old epigastric pain attributed

to an "ulcer," despite four negative x-ray studies During his many years of ulcer doctoring, the patient became discouraged and frequently abandoned all therapy Despite this, there were sudden unaccountable disappearances of complaints In the present illness there was an additional element of right lower quadrant pain of a colicky type which settled essentially suprapubically with radiation to the scrotal area

Cysto-urethroscopy and retrograde studies yielded the following significant findings diffuse cystitis, normally located ureteral orifices, slightly delayed function on the left as indicated by indigo carmine return In the posterior urethral floor, just distal to the internal sphincter, there was an irregularly scooped out area which to the examiner suggested a recent abscess pocket X-ray studies (Fig 2), showed a crossed ectopia, the left nephrogenic mass having completed its development on the right side of the spine in a low position The normally located right kidney was incompletely rotated The two kidneys were probably fused

Fig 2 Lower kidney mass illustrates a crossed ectopia. It is probably fused with the normally located, incompletely rotated right kidney

A small jagged calculus was passed in ten days and the patient was relieved of all complaints

Congenitally abnormal kidneys are usually inefficiently drained, and, in the foregoing case, we may surmise that intermittent episodes of pelvis overdistention, more likely in the lower kidney, accounted for the "ulcer" symptoms Sudden relief of the obstruction afforded sudden relief of epigastric complaints Stasis is one of the major factors responsible for calculus formation A calculus, then forming in the lower kidney pelvis, progressed to the prostatic fossa where it embedded itself in the pocket noted at urethroscopy and produced the acute urinary distress With extrusion of this, treatment relegates itself to periodic study of possible progression in drainage defect or infection and treatment as needed

Cystogram

Adequate dye is usually secreted in the late urogram films to outline bladder contour This viscus, secondarily irritated, frequently presents the first manifestation of urinary tract pathology and appropriately has been termed the mouthpiece of that system It may also serve to give a neighborly warning of otherwise undetected disturbances in pelvic organs Uterine displacements or large growths may create distortions of the bladder and by pressure effects on vesical circulation produce trigonal and bladder wall hyperemia with urinary symptoms Occasionally, a tumor may so mold itself into the pelvic cavity as to force the base of the bladder against the symphysis and create an acute retention

Case 3—The patient was a moderately obese woman, in the late forties, married, mother of two grown children, referred for study of urinary frequency and dull ache in the lower abdomen Urine was clear and uninfected Cystoscopy revealed some moderate papilledema of the internal sphincter and bladder wall congestion Renal and ureteral architecture were normal on urogram The bladder

Fig 3 Defect in bladder contour due to extrinsic pressure by chocolate cyst

contour however suggested extrinsic pressure on the fundus from the left (Fig. 3) Pelvic examination was not informative because of the patient's obesity and inability to relax. With attention focused on the genital system however a small fungating mass within the os utori was discovered Diagnosis of early adenocarcinoma was made In the course of laparotomy for total hysterectomy a large left-sided, chocolate cyst grapefruit size was found and removed

Summary

Unexplained gastrointestinal reflex complaints are often due to hidden urinary tract pathology which may be brought to light only by urogram study Two illustrative cases are presented The urogram is of aid also in discerning nonurologic disturbances by study of the impressions of extrinsic masses upon urinary tract architecture. This is especially true in the bony pelvis, and a case is presented showing detection of a cystic mass via its influence in producing defect in the bladder contour

WHO TO RECORD WORLD'S VITAL AND HEALTH STATISTICS

The decision to transfer to WHO all authority and responsibility in the field of international health statistics, including recording of births diseases, and deaths was taken by the International Conference for Revision of International Lists of Diseases and Causes of Death convened by the French Government at Paris in late April

Thirty countries participated in this Conference, the technical preparation for which was entrusted to WHO's Interim Commission The Conference was opened by French Foreign Minister Georges Bidault.

The objectives of the recommended program are to make available to all interested administrations and specialists comparable health statistics collected the world over, and thus facilitate the study of health problems.

A program of medical statistical research is also contemplated including studies of cancer registration and statistics, problems concerning statistics of malaria, morbidity and mortality from tropical diseases, foetal and infantile deaths, the influence of the confidential character of medical certification on the accuracy of resulting statistics and other studies

---

NEW DRUG FOR MALARIA

A new drug, announced as having been developed in the laboratories of Columbia University's College of Physicians and Surgeons and Schering Corporation Bloomfield and Union New Jersey was markedly effective in the treatment of cholera during the recent epidemic in Egypt.

The drug which is called phthalylsulfacetimide was used on more than 500 patients in Egypt Records were maintained on only 43 *patients*, however because of the lack of trained personnel and the chaotic conditions accompanying the epidemic Among these 43 patients treated with the drug only one died. In contrast official Egyptian Government figures have disclosed that among the 20,781 persons who were stricken with cholera, 10 273 died

The discovery was made by the medical scientists while they were engaged on a research project of a different nature. They started their work with the drug in an attempt to prove that it was effective against dysentery When this was ascertained they recognized its potential value in the treatment of cholera.

Once the discovery became known, Dr Seneca was *flown to Cairo* where the drug was immediately pressed into service

The physician left 1 000 cases of the compound with the Egyptian Government for use in the event another epidemic should break out.

It was emphasized that the drug was thoroughly tested before it was used to treat cholera patients

Special Article

THE NEW YORK STATE MEDICAL LIBRARY'S SERVICES TO PHYSICIANS

Prepared by Maude E Nesbit, Medical Librarian, New York State Library, Albany, New York

DOCTORS in the State's 62 counties are now receiving the benefits of a State law passed in 1891 The Legislature of that year established the New York State Medical Library, making it available "to every accredited physician residing in the state" By virtue of this act, doctors throughout the State have access to the latest medical information and are given the opportunity to do research and study in their profession

Regardless of where in the state a doctor has his practice, he is able to borrow books and have them sent right to his office from the State Library, which is located in Albany In many of the rural areas, doctors have no local research facilities available, and, in these cases, the State Library is their main source for obtaining books Doctors practicing in cities also find it convenient to borrow from the Library, where they can obtain books for home use

The service of the Library in preparing special bibliographies on any subject requested is one which doctors in communities of all sizes find valuable A trained staff of librarians is prepared to serve in answering all questions, making research materials available, and furnishing these bibliographies for professional reference

The State Medical Library has an extensive collection of over 60,000 volumes, covering all medical subjects In addition, the Library houses thousands of pamphlets, reprints, and reports issued by the various public health agencies of municipalities and other states and countries Over six hundred medical journals, American and foreign, are currently received

In 1891, the Library began with a collection of about 2,500 volumes donated by the Albany Medical College with the understanding that students of that institution would have access to the entire Library This original collection, along with the many volumes received after 1891, was entirely destroyed in the Capitol fire of 1911 The Library was then given quarters at its present location, the Education Building, where it has been developing through the years to its present size Under the direction of the medical librarian the collection is continually being increased, and physicians are encouraged to submit recommendations for new books

A catalog of the entire collection in the possession of the Medical Library cannot be distributed However, the Library does publish a bimonthly list of books it currently receives, and this publication is sent to any borrower at his request

The Library offers invaluable facilities to the medical, dental, nursing, and allied professions, as well as to governmental agencies Doctors, dentists, nurses, public health officers, and professional persons may borrow books The Library also loans to hospitals, medical colleges, libraries, laboratories, and similar institutions throughout the State

All requests should be addressed to the New York State Medical Library, Albany 1, New York As many as ten books may be borrowed at one time by individuals Institutional loans are limited to 25 volumes Books and bound journals may be kept for four weeks Unbound periodicals of the current year are loaned for a period of two weeks The material is sent by parcel post, and the borrower is responsible for only the return postage

If a subject is requested, the Library will send either a selection of literature or a bibliography of material, according to the borrower's request

The bimonthly lists of current material received in the Library are also available upon request

The Medical Library is a part of the New York State Library, which houses over two million books, pamphlets, and manuscripts The services of the entire Library, under the supervision of Dr Charles F Gosnell, State Librarian, are available to all residents of the State There is a general reference section, law library, legislative reference section, manuscripts section, library for the blind, and an extension division

---

PUT YOUR WIFE IN BUSINESS

Police in Georgetown, South Carolina, posted the following notice "A Poser for Boozers If you are a married man who absolutely must drink booze, start a saloon in your own home Be the only customer, and you won't have to buy a license. Give your wife $2 to buy a gallon of whiskey There are sixty-nine glasses in a gallon. Buy your drinks from your wife When the first gallon is gone, your wife will have $8 to put in the bank, and $2 to start over in business again If you live ten years, continue to buy all your booze from your wife and then die with snakes in your boots, your widow will have enough to bury you respectably, bring up your children, buy a house and lot, marry a decent man, and forget all about you"

—*J.A M A , April 17, 1948*

Case Reports

ERYTHEMA MULTIFORME BULLOSA (STEVENS JOHNSON TYPE)

ABRAHAM NATHAN, M D , PAUL J CAMERON, M D , and CARL ZELSON M D New York City

(From the Pediatric Service Harlem Hospital)

IN 1866, von Hebra described a symptom complex consisting of stomatitis conjunctivitis and an erythematous-like rash as erythema exsudativum multiforme.[1] Stevens and Johnson in 1922 reported two such cases resulting in blindness and regarded their cases as a distinct clinical syndrome.[2] However from Fletcher and Harris communication it seems that all the previous cases noted were variations of Hebra s original syndrome [3]

Erythema multiforme bullosa is a febrile, eruptive toxic disease having a multiplicity of skin lesions varying from macules to vesicles and involving the mucous membranes of the eye mouth, genitalia, and rectum. The vesicular elements may become pseudomembraneous with necrosis and ulceration Corneal scars, symblepharon and blindness are reported.[4,5] The lesions crust and heal in three to six weeks. The cause is obscure although Staphylococcus aureus is frequently cultured from the lesions. Allergic phenomena and viral agents have also been incriminated.

Case Report

J H., a 15-month-old Negro boy, was admitted to the pediatric service for a rash and fever of five days duration. The rash consisted of many 'blisters' on a red base which had started on the lower extremities and continued to spread up to the umbilical region. Four days prior to admission, the patient had been treated at the skin clinic, but because lesions continued to spread, the patient was hospitalized There was no familial history of any allergies. The child had no history of any drug ingestion food allergies, or other idiosyncracies.

Examination on admission revealed a well developed, Negro boy appearing acutely ill and highly irritable with a temperature of 101 F A moist, pruritic, erythematous, pustular rash was present on both lower extremities, whereas the trunk had many erythematous, papulovesicular lesions. The penis upper extremities face, neck, and mucous membranes of the eyes and the mouth were free of lesions. The rest of the physical examination was essentially normal

Laboratory data at the time of admission were as follows The hemogram showed hemoglobin 82 per cent 4,000 000 erythrocytes 30 000 leukocytes 70 per cent polymorphonuclears 27 per cent lymphocytes, 2 per cent eosinophils and 1 per cent basophils. Blood culture nose and throat culture Kahn test, urinalysis and the Mantoux test in a 1 10 000 dilution were all negative. Culture of the vesicular contents resulted in the growth of many colonies of S aureus (coagulase positive) and Streptococcus gamma.

The impression on admission was toxic dermatitis with multiform lesions probably secondarily infected. A dermatologic consultant agreed with this tentative diagnosis.

Treatment consisted of penicillin 10 000 units intramuscularly every three hours and wet dressings of Burow's solution in a 1 20 dilution locally for the extremities while calamine lotion was applied to the lesions on the trunk. The child became afebrile on the third hospital day and showed marked clinical improvement Penicillin was discontinued, but the local treatment was maintained. This afebrile period lasted three days

The old skin lesions regressed but new crops of vesicles and bullae began to appear on the upper extremities and face On the sixth hospital day, the child again became acutely ill with a temperature of 105 F Vesicles and bullae were noted on the lips and buccal mucosa. The penis, especially at the meatal margins, was covered with vesicles. Lacrimation epiphora, and injected conjunctivae were the outstanding eye findings. The diagnosis of erythema multiforme bullosa was then made. Therapy consisted of intramuscular injections of penicillin 30 000 units every three hours, while Burow's solution and calamine lotion were applied locally on the skin lesions. Mouth rinsings with diluted hydrogen peroxide were performed several times daily The eyes were irrigated with simple boric acid solution

The oral lesions became confluent finally breaking down with the production of a fetid bloody profuse discharge Necrotic areas on the buccal mucosa and lips were covered with slimy gray pseudomembranes. The tongue swelled so enormously that a tracheotomy set was kept prepared for emergency During this difficult period constant aspiration of the oral contents was necessary Nutrition was maintained by a high caloric fluid diet. The penile lesions broke down, resulting in a balanitis with a thin exudate involving the meatal margins. The urethra, however remained patent.

Occasional starch and oatmeal baths were given to alleviate the pruritis Penicillin ointment 500 units per Gm was applied to the right side of the face while calamine lotion was continued on the left side. No differences in the rate of healing were noted. On the twelfth hospital day, it was evident that the spread of the disease had halted and that regression was taking place No new vesicles appeared, whereas the old ones became encrusted. The scabs fell off, leaving no scars or pigmented areas. A hemogram on the twelfth hospital day revealed hemoglobin 79 per cent erythrocytes 4 200 000 leukocytes 15 000, polymorphonuclears, 70 per cent lymphocytes 26 per cent monocytes 2 per cent, and eosinophils, 2 per cent. On the fourteenth hospital day the temperature returned to normal and the patient remained afebrile until discharge

Normal mucosa began to fill in the necrotic areas in and about the mouth, causing the slimy membranes to be sloughed off The tongue gradually returned to its normal dimensions The penile lesions followed a course somewhat between the oral and skin lesions All lesions disappeared on the twenty-eighth hospital day, and the patient was discharged cured on the thirtieth hospital day

Comment

The child on admission had lesions suggesting erythema multiforme but no other findings to suggest a Stevens-Johnson syndrome This is especially true since most of the lesions discernible were of a pustular nature and had not involved the mucous membranes Due to the pyogenic organisms present in the pustular and vesicular elements, penicillin was considered the medicament of choice

Although a clinical response was obtained with a three-day period of apparent remission, the spread of the lesions could not be checked On the sixth hospital day the typical Stevens-Johnson syndrome became evident Penicillin was again administered [6]

It is difficult to evaluate the effects of penicillin therapy We feel that penicillin prevented virulent secondary invaders from taking foothold in the already devitalized necrotic tissues Penicillin may have shortened the course of the disease, but of this there is no proof It is also felt that the penicillin was instrumental in preventing severe eye lesions because the panophthalmitis in reported cases may have resulted from secondary infections

Interestingly enough, the use of penicillin ointment had no greater advantages over the ordinary Burow's solution or calamine lotion The severe stomatitis, cheilitis, and lingual edema caused great concern in view of the several respiratory deaths reported [7] Eosinophilia was not notable in this patient during the course of the disease [8]

TO STUDY OCCUPATIONAL CANCER HAZARDS

The United States Public Health Service has announced that it has set up a special section of the National Cancer Institute for the study of occupational cancer hazards

Dr W C Heuper, who will direct the work, is with the Warner Institute for Therapeutic Research in New York

"It seems clear that part of the increased incidence of cancer is linked to the growth of industry during the past 100 years and to the dangers of prolonged exposure to certain substances," Dr Heuper said

"Certain chemical substances have been suspected of causing cancer ever since the end of the eighteenth century when a British physician first noticed the high incidence of skin cancer among London's chimney sweeps," he added

"A number of chemicals have been definitely shown to cause cancer in mice and other experimental animals More recently, we have learned to protect workers handling radioactive materials, x-ray equipment, and certain carcinogenic chemicals, from the dangers of cancer and other harmful effects"

A negative chest x-ray today is valid only today, chest roentgenography should be universal and periodic —*Exchange*

Sometimes renal tuberculosis is without symptoms, and the only finding is a slight pyuria containing tubercle bacilli —*Exchange*

THE MANAGEMENT OF DIABETES COMPLICATED BY TUBERCULOSIS

MORRIS ANT M.D and ROBERT A LOVE, M D , Brooklyn New York
(*From the Kings County Hospital*)

IT HAS long been known that diabetic patients are especially susceptible to tuberculosis The regime of therapy when the two diseases coexist in one person requires more special consideration than if treated separately in different individuals, since they produce new and weighty problems. According to surveys over many years tuberculosis occurs four times more often in diabetic patients than in non-diabetics.[1] Tuberculosis, because it may affect many gland organs such as the liver or adrenals, by miliary involvement and fibrosis, interferes with the normal sugar metabolism, thus becoming a factor in the causation of diabetes This was pointed out by Murray and Morgan in their experiments on carbohydrate metabolism in ascorbic acid-deficient guinea pigs under normal and anoxic conditions.[2] They reported that ascorbic acid-deficient animals had significantly higher blood sugars and probably significantly lower liver and carcass glycogen. The intestinal absorption of the sugar, the authors continue is less complete in the vitamin C-deficient animals, and they reason that tuberculosis reduces ascorbic acid metabolism.

Because of the large involvement and proliferation of the connective tissues pulmonary fibrosis may interfere with the oxygen exchange and thus aggravate a condition such as diabetes. This is aggravated by concomitant pleural thickening

In their experiments on rats Hove Hickman and Harris found that when the animals were placed on a diet in which part of the carbohydrates were replaced by fat they presumably had a greater oxygen requirement because the respiratory quotient was lower.[3] They stated that this lower respiratory quotient was reflected in the fact that the rats on the low fat diets survived for a longer time than those on the high fat diets and that there is an increased resistance to anoxia at high levels of tocopherol if the amount of fat in the diet is low

Billimoria and Jacoby observed that chronic fibrotic forms of tuberculosis have a poor sugar tolerance and their blood sugar curves are diabetic in type.[4] On the other hand those with exudative ulcerative, pulmonary tuberculosis seem to have a high sugar tolerance and the descending limb of the curve is not diabetic in character

Banyai and Cadden point out that vitamin A deficiency may predispose diabetics to tuberculosis.[5] Lack of vitamin A causes definite pathologic changes in the mucosa of the respiratory system thereby increasing the opportunity for bacteria to enter the lungs and bronchial tissues. These authors feel that the administration of large doses of vitamin A serves as a useful supplemental therapy in the management of diabetes mellitus complicated by pulmonary tuberculosis.

In an article on tuberculous diabetics P Melvin Jr., and H. T Englehardt report that in nearly 50 per cent of these cases cavities occur and cascations develop very rapidly.[6] They observed x rays which showed 'a typical butterfly' type of lesion—a soft exudative process spreading peripherally from the hilus Pleural adhesions are more common Diabetics who develop coma are more apt to have tuberculosis.' It has been reported by several authors that cavitation is more frequent when pulmonary tuberculosis is complicated by diabetes.

The case here presented shows that when the diabetes complicated by tuberculosis was properly controlled, the condition of the tuberculosis improved speeding ambulation

Case Report

The patient, a 34-year-old poorly developed, poorly nourished white man gave a history of diabetes for the past twelve years For the last four to five years he was taking 60 to 70 units of protamine zinc insulin each morning In September of 1945 an x ray showed a soft, exudative tuberculosis of the upper two thirds of the left lung and the right first interspace. He was admitted to Kings County Hospital with a diagnosis of a moderately advanced pulmonary tuberculosis. He was treated with a 2 500 calorie diet 65 units of protamine zinc insulin daily and pneumothorax. Between January 16 1946 and his discharge on March 4 1946 he received 12 pneumothorax refills

While in the hospital his urine was almost continuously on a 3 to 4 plus level despite blood sugar levels during control periods on several occasions of 100 to 144 mg. per cent. After discharge the patient was sent to a sanitarium in Colorado for rest and continuation of his pneumothorax. While he was in Colorado his diabetic condition was treated on the basis of covering his glycosuria with insulin He had several insulin reactions resulting in a flare-up and loss of control of his diabetic condition As a result the tuberculosis could not be properly treated To make things worse he developed diarrhea. He was then sent back to Kings County Hospital for treatment of the diabetic condition

On readmission, he pleaded with the resident not to treat him with routine insulin coverage because, as he explained, 'I can go into insulin shock even with a 4 plus sugar in my urine. No doubt this was due to a low sugar tolerance and a disturbed renal threshold which in our opinion was induced by the continuous use of protamine zinc insulin

Physical examination of the lungs revealed dullness to percussion in the left upper and left lower lobes. The breath sounds were decreased over the whole left lung field anteriorly and posteriorly There were moist crackling rales over the left upper lobe, and vocal fremitus was decreased over the entire lung The heart was not enlarged. The rhythm was regular and A_2 was greater than P_2 Examination of the extremities revealed the left arm flexed 45 degrees at the elbow and 90 degrees at the wrist with ulnar deviation of the fingers His past history revealed that his left arm had been paralyzed since birth His blood pressure was 110/70 temperature 98 6 F pulse 92 and respirations 20.

It had been planned to transfer the patient to a tuberculosis sanitarium, but because he feared going to a sanitarium where the diabetic control might again be lost he asked to stay at the hospital

He was put on a routine which was not based on a haphazard coverage of urine glucose alone but rather consisted of, (1) establishing a fixed diet—200 Gm carbohydrate, 75 Gm protein, and 70 Gm fat, the diet being of a high calcium content, (2) removing protamine zinc insulin from the therapy, and (3) replacing it with crystalline zinc insulin, 30 units three times daily He continued on this dosage about two weeks when he began showing insulin reactions for three consecutive nights The insulin was cut, first to 30 units morning and noon and 20 units at night, and slowly reduced until, two weeks before discharge, he was stabilized on the same diet and 25 units in the morning and 20 units at night of crystalline zinc insulin His diarrhea slowly diminished He was permitted ambulation

During his hospital stay, the patient's appetite improved, and he gained weight The sputum became negative, gastric washings for tubercle bacilli were negative The lungs became free of rales, breath sounds improved, but dullness throughout the left lung persisted His entire physical condition showed improvement His diarrhea stopped, and subsequent x-rays of the lungs showed suggestions of improvement of the lung pathology Discontinuation of the pneumothorax was advised because of its ineffectiveness, and he was kept for a while on complete bed rest until his diabetic status was controlled

Discussion

Walther and Ammon feel that injections of small amounts of foreign protein, of which protamine is one, over a number of years cannot be disregarded as deleterious unless further studies are made [6] They are of the opinion that permanent injections of foreign protein may produce late injuries, especially to the vascular system We found, particularly in our case, that protamine zinc insulin was one of the offenders of the proper physiologic actions of the kidney and acted as a foreign protein It, therefore, interfered with an already disturbed metabolism of the lungs, thus creating a vicious cycle by prolonging the active stage of tuberculosis and reversibly creating a more severe diabetes

Sindoni cites a case of a 33-year-old man who had diabetes associated with pulmonary tuberculosis for eighteen years [7] The patient was admitted to the hospital in a comatose condition after having been found unconscious on a vacant lot Prior to the accident, his dosage had been 15 units of plain and 18 units of protamine insulin for breakfast and 10 units of plain insulin for supper At the time of hospital admission, his blood sugar was 52 mg , and the carbon dioxide combining power of the blood plasma was 40 mg In spite of therapy he never regained consciousness and died five days after admission

A paper to be published by one of us (M A) discusses the toxic effects of the prolonged use of protamine zinc insulin When a patient uses protamine zinc insulin over a long period of time, there is evidence of facial puffiness, thickened lid and lid margins, increased blood cholesterol, creatinine, and uric acid, a disproportion between the blood and urinary sugar, and a low blood sugar, despite a high urinary sugar, simulating a renal diabetes However, when the medication was changed to crystalline zinc insulin, the symptoms disappeared, and the sugar tolerance, both for the blood and kidney, increased These factors indicate a damage to the permeability of the tubules and the sugar filtration mechanism.

Many unfavorable reactions by protamine zinc insulin are reported by Sindoni, including blurred vision, loss of appetite, frequent headaches, weakness in the legs, slight to extremely marked fatigue, increased irritability, lapse of memory, morning nausea and vomiting, and vertigo [7] He points out, in relation to the case cited above, that patients having low blood sugar levels over long periods and at irregular intervals may slowly or suddenly show evidence of permanent cerebral damage due to these low blood sugar levels

In the case which we have presented, the continuation of pneumothorax refills, both in the hospital during his first admission and then during his stay in Colorado, proved of no aid in controlling the tuberculosis, and complete bed rest was instituted as the therapy of choice Since it is known that pneumothorax is an accepted and successful method, the failure of this treatment in this particular patient must be attributed to poor diabetic control

Banyai and Cadden emphasize the fact that since empyema very frequently complicates artificial pneumothorax in patients with exudative and caseous tuberculous lesions of recent origin, the institution of this type of therapy should be handled with caution in the diabetic tuberculous patients [1]

With the incidence of tuberculosis being of such a high rate in diabetic patients, it is extremely important that all diabetic individuals be x-rayed for chest pathology

Summary

1 Some of the reasons for the diabetic patient's predisposition to tuberculosis are given

2 A case of tuberculosis complicated by juvenile diabetes mellitus is described

3 If the diabetic condition is properly controlled, the condition of tuberculosis is improved

4 Protamine zinc insulin is considered to be contraindicated in diabetics suffering from tuberculosis

5 Insulin coverage should not be based on urinary glucose findings at irregular intervals but should be calculated on a twenty-four-hour metabolic requirement

6 Contraindications to collapse therapy in tuberculosis complicated by diabetes are discussed.

7 Proper diabetic care and control will lessen hospital stay and reduce sanitarial care

DIVERTICULITIS OF THE RECTOSIGMOID WITH ACUTE OBSTRUCTION CAUSED BY ASSOCIATED INTUSSUSCEPTION

GEORGE M SAYPOL, M D , and MACK LIPKIN, M D , New York City

(From the New York Post-Graduate Medical School and Hospital)

DIVERTICULITIS of the colon causing acute obstruction is not common. In association with intussusception it must be rare In the following case the diagnosis could not be made with certainty until the diseased area was excised and inspected at the time of operation As a result the remaining portion of rectum (7 cm.) was spared and a satisfactory anastomosis was performed

Case Report

M O , a 72-year-old white man, was admitted to the hospital on August 9, 1947, with a five-day history of abdominal cramps nausea, and obstipation There was a past history of bowel irregularity for several years. Dysuria and nocturia due to a hypertrophied prostate had been present during the preceding five years. Examination revealed an acutely ill patient with distension visible peristalsis and a metallic tinkle on auscultation of the abdomen A scout film of the abdomen showed markedly distended loops of bowel including the descending colon (Fig. 1) After adequate preparation including the use of a Miller Abbott tube and parenteral therapy an operation for intestinal obstruction was performed. This consisted of transverse colostomy without exploration of the abdominal cavity done with 1 per cent procaine by infiltration for anesthesia. The postoperative course was satisfactory complicated only by urinary retention requiring a Foley catheter

On August 15 1947, a barium enema revealed slight narrowing at the rectosigmoid region with diverticulosis of the sigmoid colon (Fig. 2) On August 20, 1947 sigmoidoscopy was attempted It was difficult to pass the instrument beyond six inches because of the patient s discomfort At this point the mucosa appeared congested, and the lumen could not be discerned Saline washings from the rectum were taken for cytologic examination which proved negative for tumor cells. An incidental finding at the time was a rectal polyp 1 cm. in diameter, which was removed The patient was discharged from the hospital under continued observation. The colostomy was functioning well while the urinary symptoms were unimproved.

On September 4, 1947 after two attempts to repeat the barium enema a trickle of the solution passed beyond a markedly constricted area in the

FIG 1 Scout film of the abdomen showing distended loops of colon

FIG 2. First barium enema. Lateral view showing diverticulosis of the sigmoid with some narrowing at the rectosigmoid region.

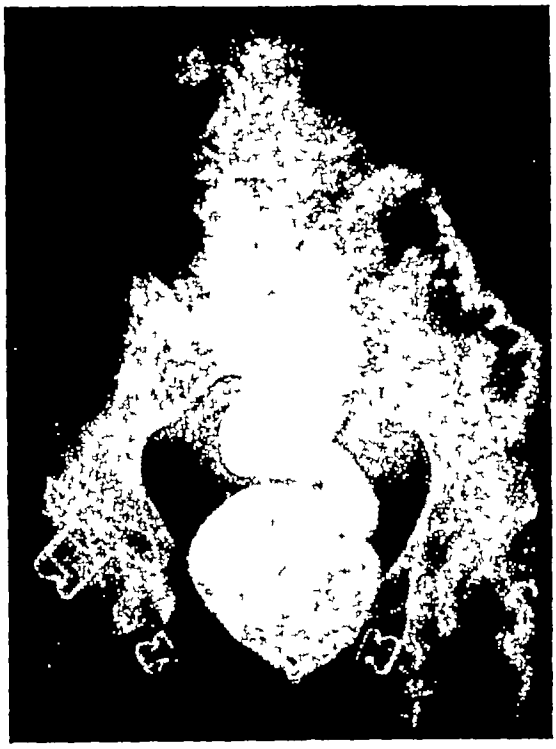

FIG 3 Barium enema, nineteen days later Anteroposterior view showing marked narrowing at the rectosigmoid region permitting only a trickle of dye to pass proximally into the colon (The four circular dense areas are metal buttons on a colostomy bag)

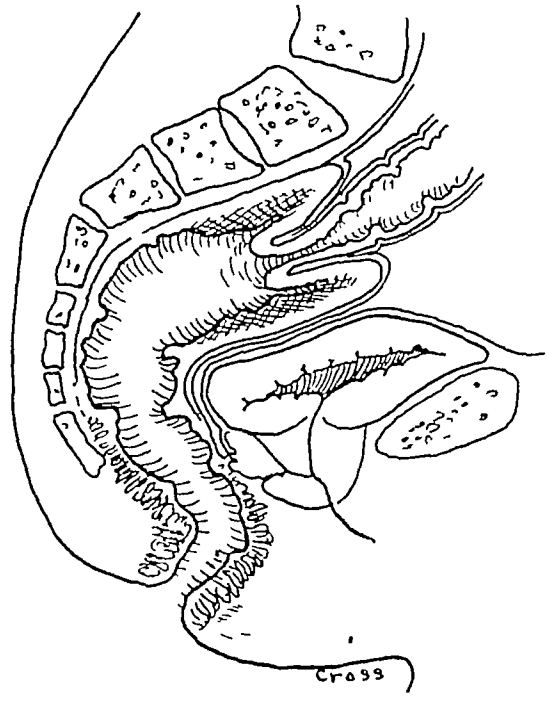

FIG 4 Diagrammatic representation of the pathology found at operation

rectosigmoid (Fig 3) Because of the marked narrowing occurring during a nineteen day interval between x-ray studies, exploration was decided upon in order to rule out carcinoma.

The patient was readmitted to the hospital, and on September 10, 1947, under gas-oxygen-ether anesthesia, operation was performed At the brim of the pelvis and extending inferiorly there was a firm, obstructing mass involving the rectosigmoid and densely adherent to a distended urinary bladder The mass with adjacent sigmoid and upper rectum was mobilized and excised for immediate examination This revealed a rectosigmoid with intact mucosa and markedly thickened walls and a sigmoid intussusception, causing almost complete obstruction The remaining lumen was a fraction of a centimeter in diameter (Fig 4) A two-layer, open primary anastomosis was performed, and the infraperitoneal area was drained The pathologic report was as follows

Gross examination reveals that the segment measures 17 3 cm in length The proximal two thirds shows well-demarcated taenia The distal 5 5 cm shows markedly congested serosa adjacent to a ragged indurated serosal tear 3 by 2 cm The latter reveals a thick fibrotic subserosa on section The mucosa is folded and along the mesenteric attachment reveals pouches of diverticula spaced at intervals of about 2 cm Within the indurated area, the diverticula have wide mouths and fibrous bases On section the diverticula are free of foreign material Scattered throughout the mucosa are several lenticular nodules ranging from 2 to 4 mm. in diameter

Microscopic examination shows each diverticulum with an intact mucosa and submucosa invaginating into the muscular coats The latter are thinned, and their adjacent subserosa is broad and densely fibrous' A larger artery and vein lie opposite each pouch In the region of the constriction are several diverticula whose muscularis and subserosa are replaced by dense fibrous tissue severely infiltrated with an exudate of neutrophils, plasma cells, and multinucleated foreign body giant cells The polypoid mass is described by areas of submucosal edema and congestion with hyperplastic lymphoid follicles The overlying glandular epithelium is intact The tissue removed from the bladder wall consists of thick, necrotic fibrous and granulation tissue filled with the exudate described Large nests of foreign body giant cells are also noted in this In all sections, no evidence of malignant change is noted

The diagnosis was diverticulosis and chronic diverticulitis of colon

The postoperative course was good, and on September 30, 1947, an intraperitoneal closure of the transverse colostomy was performed The urinary symptoms improved On October 7, 1947, the patient was discharged from the hospital and several weeks later returned to work in good health

COEXISTENCE OF THE WOLFF PARKINSON WHITE SYNDROME AND ORGANIC HEART DISEASE

SEYMOUR H RINZLER M D , New York City

(From the Cardiac Service Beth Israel Hospital)

IN 1940 Hunter Papp and Parkinson brought the literature up to date by collecting 109 cases of the Wolff Parkinson-White syndrome.[1] This syndrome was associated with organic heart disease in 21 of these cases an incidence of 19 per cent As to the cause of the concomitant cardiac lesions they listed hypertension mitral stenosis aortic insufficiency (syphilitic and rheumatic) and coronary thrombosis but they failed to state the total number of cases for each etiologic type

Our interest in this subject was stimulated by a study in which the limitations of the electrocardiogram in the diagnosis of acute myocardial infarction in the presence of the syndrome of short P R interval and prolonged QRS complex were pointed out [2] Briefly, the essential criteria even in the presence of organic heart disease which establish the diagnosis of the Wolff Parkinson-White syndrome are as follows a P R interval of 0 10 second or less, a QRS complex of 0 10 second or more and slurring of the initial ventricular deflection in the first or second lead The object of the present report is to review the literature in detail with respect to the incidence of the various etiologic types of organic heart disease when associated with the Wolff Parkinson White syndrome and to add another case which illustrates this coexistence

Case Report

H B a 56-year-old white man was admitted to the hospital on April 23 1942, because of substernal pain of fourteen hours duration which was severe enough to wake him from his sleep The pain radiated through the chest to the back. He was covered with a cold sweat and had a fear of impending death. He was given 0 015 Gm. morphine sulfate subcutaneously by his physician with some relief of pain but this was followed by vomiting He had been a known hypertensive for three years

The physical examination revealed a rectal temperature of 98.6 F The patient was under nourished and appeared acutely ill There was no dyspnea or orthopnea. The neck veins were not distended in the erect position The heart sounds were poor, with the point of maximum impulse in the fifth intercostal space at the anterior axillary line. There were no thrills or murmurs The pulse rate equaled the ventricular rate and was 78 beats per minute. The blood pressure was 148/104 There was no enlargement of the liver or spleen and no peripheral edema

Pertinent laboratory data on admission included a white blood count of 12 100 cells per cu mm with 87 per cent neutrophils and a blood sedimentation rate of 10 mm at the end of forty five minutes.

The patient was asymptomatic throughout his hospital stay His course is outlined in Figure 1 The temperature rose to 101 4 F by the fifth hospital day and then fell gradually to normal by the seventeenth day The blood pressure fell to 118/74 on the second day It then varied between 118 to 142 systolic and 66 to 80 diastolic until discharge when a pressure of 104/90 was recorded The white blood count and neutrophils were at their peak on admission and subsequently fell to within normal range. The blood sedimentation rate climbed to 62 mm. at the end of forty five minutes by the twelfth hospital day and declined to 20 mm. in forty five minutes on the thirty-seventh day

The clinical picture was that of an acute myocardial infarction in a patient with hypertensive and arteriosclerotic heart disease. The electrocardiograms (Fig. 2 *A B C, D* and *E*) showed the short P R interval and prolonged QRS complex pathognomonic of the Wolff Parkinson-White sydrome

The patient was discharged on the forty third hospital day and has been followed in the cardiac clinic

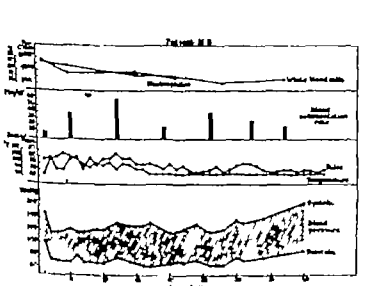

FIG 1 Chart outlining course in hospital

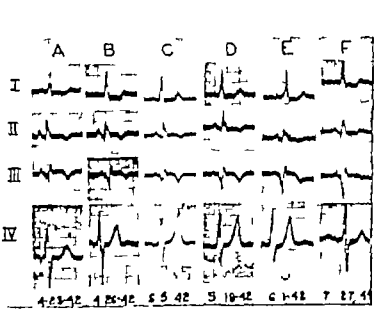

FIG 2 Electrocardiograms taken during period of hospitalization (*A* to *E*) Shortened P R interval (0 10 second or less) and prolonged QRS complex (0 10 to 0 12 second) are seen Note minor changes in T_1 from diphasic (*A B*) to upright (*C D*) and then diphasic again (*E*) Electrocardiogram taken two years later (*F*) Note similarity to previous tracings

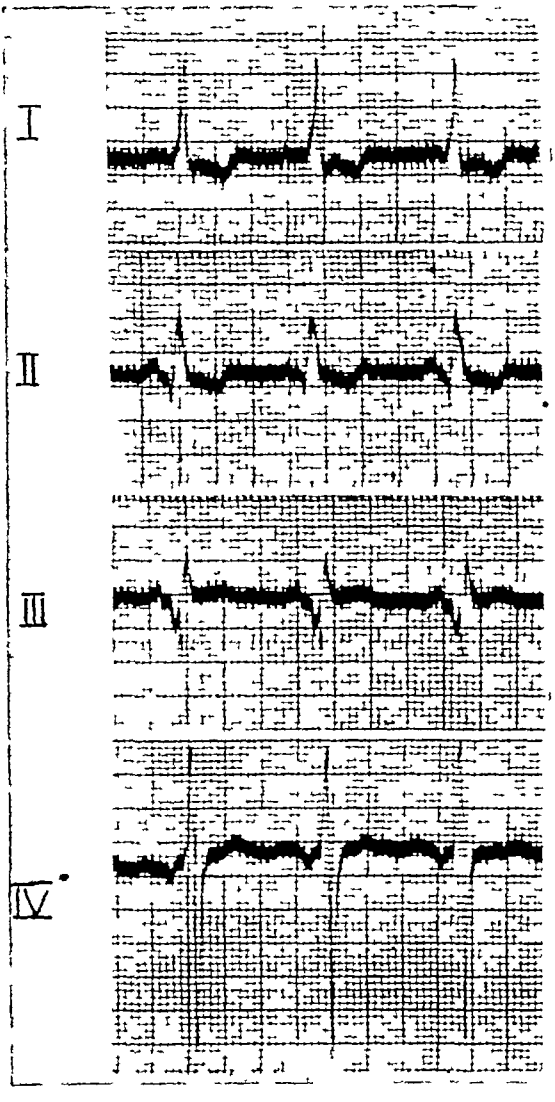

FIG 3 Electrocardiogram taken four years after acute myocardial infarction Short P-R interval and prolonged QRS complex persist

since He has had no chest pain to date By the end of 1942, his blood pressure had risen to 230/120 and has persisted at this level Electrocardiograms taken in 1944 (Fig 2 *F*) and in 1946 (Fig 3) still showed a short P-R interval and prolonged QRS complex

Discussion

This case appears to be similar to the 38 cases previously reported in which organic heart disease and the Wolff-Parkinson-White syndrome were associated The classification of the heart disease in these 39 patients (Table 1) was as follows congenital, one case, rheumatic, 14 cases, arteriosclerosis, 12 cases (8 with coronary artery disease and 4 with coronary thrombosis), hypertension, nine cases, and thyrotoxicosis, two cases

Two facts are worthy of emphasis The first is that the syndrome of short P-R interval with prolonged QRS complex may be discovered at any age It has been reported in individuals as young as fourteen weeks of age and as old as the seventies [17 18] The second is that, although this syndrome is found in association with heart disease of almost every cause, it is still more common in patients without organic heart disease One is, therefore, led to believe that the occurrence of the Wolff-Parkinson-White syndrome depends for its existence on the functioning of an anatomic pathway known as the Bundle of Kent, and that its association with organic heart disease represents an accidental circumstance [19 20]

There is a practical application of the recognition of this association in the treatment of organic heart disease Patients with the Wolff-Parkinson-White syndrome are especially prone to paroxysms of rapid supraventricular rhythms In the normal heart this may be of little or no consequence, but it is known that in the diseased heart, circulatory complications as serious as congestive heart failure or even death may result from a paroxysmal rapid rhythm [21 22] One of our patients had bouts of rapid auricular fibrillation associated with pain in the chest and shortness of breath of such frequency and duration that he became almost totally incapacitated [2] The paroxysmal arrhythmia was finally

completely controlled by 1 8 Gm daily of quinidine sulfate orally and the patient was able to return to his job as a salesman There has been no recurrence of the arrhythmia in the ensuing six month period of observation

Summary

1 A case illustrating the association of the Wolff Parkinson-White syndrome and acute myocardial infarction is reported

2. The literature relating to the coexistence of the syndrome with organic heart disease is reviewed

3. The clinical importance of the knowledge of the association of the two conditions in relation to paroxysms of rapid rhythm is stressed

MYELOGENOUS LEUKEMIA RESULTING FROM BENZOL POISONING

JOSEPH D SACCA, M D , Flushing, New York

(From the Mary Immaculate Hospital, Jamaica)

BENZOL (benzene) has been known to cause fatal aplastic anemia since Santesson's description in 1897 of four cases of workers in a bicycle tire factory and since then the classical picture of leukopenia, anemia, and thrombocytopenia represents only the severe form of benzol poisoning Pathologically it has been explained that benzol brings about a progressive degeneration of blood-forming bone marrow with subsequent disappearing of red blood cells, granulocytes, and thrombocytes from the peripheral blood stream. In 1912 Korenyi was the first to attempt the treatment of myelogenous leukemias with small doses of benzol based on the assumption that the latter was known to diminish the activity of the bone marrow His attempts met with little success due to the extreme toxicity of the drug and were later abandoned

In 1916 a confusing paper by Selling and Osgood was published followed with a report of six cases of leukemia noted in patients that had been previously exposed to benzol.[1] In 1928 Delore and Bergomano reported a case of myelogenous leukemia in a man who had previously spent five years extracting pyramidon with benzol [2] This was followed in 1932 by a report by Falconer of a case of lymphatic leukemia developing in a worker who had recently recovered from acute benzol poisoning [3] In 1933 Lignac who became extremely interested in the effects of benzol, injected 54 white mice with small doses of benzol and produced a true leukemic process in eight cases [4] Later in 1939, Frf and Rhoads reported nine cases of exposure to benzol.[5] Of these, eight developed the typical picture of an aplastic anemia with anemia leukopenia and thrombocytopenia followed by complete recovery The ninth case developed a white blood count of 130,000 and subsequently died with typical findings of myeloid leukemia proved by post mortem examination Also in 1939 Bondwich *et al* , made a very extensive study of benzol poisoning and its effect on the bone marrow and reported two cases of leukemia following exposure to benzol [6] They also showed that mild contact with benzol could produce a transitory leukocytosis in quite a few nonfatal cases

The conclusions drawn from these reports have been that generally long exposure to benzol results in the degeneration of the bone marrow producing an aplastic anemia. On the other hand in a few rare instances, benzol has done the opposite, namely stimulation of the bone marrow resulting in a true leukemic process

Case Report

A. P , a 44-year-old white man, was first seen on September 21 1947 with the chief complaint of epigastric pain. He was well until July 1946 when he first started having attacks of intermittent epigastric pain radiating to the right upper quadrant of his abdomen and to his back. These episodes of pain usually followed several hours after meals but on occasion had no connection with his food intake. Nausea without vomiting was the rule in all these seizures and on occasion the patient reported

bouts of diarrhea followed by even more severe pain Over a period of time he concluded that he could not tolerate citrus fruits and chocolate, since they were often associated with the attacks

During these fourteen months the patient saw several physicians who persistently treated him for peptic ulcer without appreciable relief He had gradually lost 30 pounds of weight since the onset of symptoms Finally, in May, 1947, patient had gallbladder and gastrointestinal x-ray series performed, and both x-rays revealed no pathology

His last severe attack was on September 21, 1947, when I was first consulted, and I advised hospitalization for work-up The interesting piece of history that I obtained at this time was that he had had almost continuous exposure to benzol and other solvents from October, 1942, until October, 1946

Physical examination revealed a fairly well-nourished white man in mild distress Temperature 98 6 F , pulse 84, blood pressure 112/70, respirations 20 per minute The skin had a yellowish pallor without rashes or purpura The eyes, ears, nose, and throat were normal The heart was normal in size, and there were no thrills or murmurs The lungs were clear on percussion and auscultation. The abdomen was soft and slightly tender in the right upper quadrant and epigastrium The liver was enlarged four fingers below the costal margin, and the spleen was palpable one finger below the costal margin No fluid or other masses were noted. In the lymphatic system there were two very hard, slightly tender, large nodes and also several hard and slightly enlarged inguinal nodes bilaterally No masses were found on rectal examination and the prostate was normal in size and consistency The extremities were normal, reflexes were physiologic bilaterally, and the Babinski sign was negative Barium enema was negative

Laboratory examination revealed the following data Urinalysis was negative except for traces of albumin Cephalin flocculation test was negative, as was the Kahn test The icterus index was 4 3 No blood or parasites were seen in the stool

A complete blood count on September 23, 1947, showed 4,550,000 red blood cells, hemoglobin 14 Gm , 53,850 white blood cells Table 1 shows the differential count

TABLE 1 RESULTS OF DIFFERENTIAL COUNTS

Leukocytes	Per Cent on September 23 1947	Per Cent on October 4 1947	Per Cent on October 17 1947
Polymorphonuclears	65		
Mature		15	18
Immature		28	23
Stab forms	11		
Metamyelocytes	5	15	20
Myelocytes	8	27	27
Eosinophils	2		
Eosinophilic meta myelocytes		3	4
Monocytes			2
Lymphocytes	8	11	7

For financial reasons, the patient insisted on being discharged and was followed at home after one week's hospitalization Treatment consisted of bed rest and increased vitamin and caloric intake

On October 4, 1947, a second blood count revealed a white cell count of 90,500, and on October 17, 1947, there were 3,800,000 red blood cells, 12 5 Gm of hemoglobin, and 128,500 white blood cells The differential counts for these dates are shown in Table 1

Conclusion

A case is presented of a man exposed continually to benzol for four years, developing, finally, a syndrome which was clinically typical of myelogenous leukemia with corroborative blood findings In view of the literature cited, there appears to be a strong correlation between the chronic exposure to benzol and the leukemic process developed in this otherwise normal white man

DEATH RATE DOWN FOR "CATCHING DISEASES"

In spite of this being a big measles year, the combined death rate for the four chief "catching" diseases of children, measles included, reached a new low during the first quarter of the year, statisticians of the Metropolitan Life Insurance Company report

The death rate among the company's industrial policyholders for measles, scarlet fever, whooping cough, and diphtheria combined was 1 6 per 100,000 for the first three months of the year The rate for measles was only 0 6 per 100,000 A "truly remarkable" record has been established for tuberculosis so far this year, also The death rate from this disease for the first quarter of 1948 was 28 2 per 100,000 policyholders This is 13 per cent below the rate for the same three months last year and 25 per cent below the average for the same parts of the preceding five years

—*Science News letter, May 29, 1948*

LEIOMYOFIBROMA OF THE FALLOPIAN TUBE

SYDNEY W STRINGER M D Syracuse New York

(*From the Syracuse Memorial Hospital*)

LEIOMYOFIBROMA of the fallopian tube is of such rarity and so few have been reported in the American literature that an instance of this benign tumor warrants its presentation Kelly and Cullen noted in 934 reports of leiomyofibromata of the uterus just one tubal myoma [1] Dietrich in his review in 1926 found but 39 [2] Since then 13 additional instances have been noted.[3–15]

Leiomyofibromata of the tube are usually single and small, although a tumor weighing 2 kg has been reported They may be subperitoneal interstitial or submucous. Tuberculosis has been described as a concomitant finding and torsion of the tube and ectopic gestation have been assigned to them. Grossly, they have been confused with adenomyomata and the nodules of salpingitis nodosa. Histologically they show the same structure and undergo the same changes as fibroids elsewhere

The tumor is discovered at operation and there are no specific diagnostic criteria which are different from those found with fibroids of the uterus

Case Report

Miss F P., age 40 was admitted to the Syracuse Memorial Hospital on September 8 1940, complaining of a mass in her abdomen She was known to have had a small fibroid in 1940 This was asymptomatic and the patient was examined at periodic intervals. During 1940 the tumor increased rapidly in size so that the patient could palpate the abdominal mass. She gave the history of having had her right tube and ovary removed for an ovarian cyst in 1938. An appendectomy was performed at the same time. In 1941 a cervical polyp was removed. The remaining history was noncontributory

A hysterectomy and left salpingo-oophorectomy and ovarian transplant were performed The uterus was studded with numerous large nodules In the isthmal portion of the left tube there was a firm circumscribed nodule having the typical appearance of the leiomyomata found in the uterus The postoperative course was uneventful

The pathology report was as follows "The specimen consists of a uterus, left tube, and a portion of a left ovary removed in supracervical hysterectomy The outer surface of uterus is red-yellow smooth and glistening and is irregularly enlarged due to the presence of several subserous myomata. The uterus measures approximately 9.5 by 6.5 by 11 cm. There are numerous thin adhesions on the outer surface. The interior of the uterine cavity has been opened bilaterally exposing a moderate amount of red-brown endometrium and a few small intramural myomata. In the proximal portion of the left tube and separate from the cornu there is a yellow nodule, extremely firm, occupying the lumen of tube and measuring 2.5 by 2 by 2 cm On cut section it is irregularly white and yellow and has the whorled appearance of a myoma. The myomata of the uterus are well encapsulated firm, irregularly white and yellow in color, and present the typical whorled appearance The ovary accompanying this specimen measures 4.5 by 3 5 by 2.5 cm., it is cystic and contains several corpora lutea in various stages of degeneration."

The microscopic description was as follows "The sections of the nodule in the tube have the characteristic cytology of a leiomyofibroma (Fig 1)

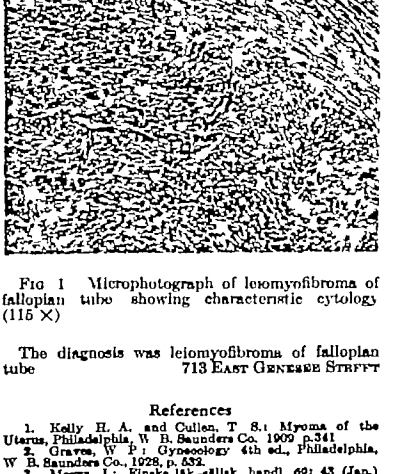

FIG 1 Microphotograph of leiomyofibroma of fallopian tube showing characteristic cytology (115 ×)

The diagnosis was leiomyofibroma of fallopian tube

CONGENITAL MALFORMATION OF THE ESOPHAGUS WITHOUT TRACHEO-ESOPHAGEAL FISTULA

JAMES R LISA, M D , and HELEN M TAYLOR, M D , New York City

CONGENITAL anomalies of the esophagus have, up to recent years, been mainly of pathologic interest and were considered incompatible with life Since surgical intervention now offers some hope, they have attained more general interest The majority of patients have fistulous tracts between the respiratory system and the esophagus, but a goodly number exist without this anomaly These latter instances are sufficiently unusual and present certain features so that the report of another case is warranted

Case Report

The patient, a boy, was born on January 25, 1946 The mother was a primipara admitted to the hospital in the seventh month of gestation The pregnancy had progressed normally to the fifth month, there had been only a slight albuminuria At this point, there occurred a rapid gain in weight with abdominal distention. There were no signs of toxemia, the blood pressure remained low and albuminuria had not increased Roentgenologic examination revealed no abnormalities of the fetal skeleton A diagnosis of hydramnios was made

The child was delivered normally and cried spontaneously His color was poor, and there were suppressed breath sounds with an occasional dry rale over the left lower lung field

Six hours after birth, he was given his first feeding of 1/2 ounce of lactose, and thereafter he was fed every three hours for the first day With each feeding, he became cyanotic, gasping, and regurgitated part of the meal On the second day, feeding was discontinued and clysis substituted He voided normally and passed one meconium stool Death occurred at the fiftieth hour

Autopsy —The pertinent findings are confined to the thorax

The upper esophagus consists of a moderately dilated and hypertrophied pouch ending blindly at the level of the tracheal bifurcation The lower esophagus is a blind pouch, 2 cm in length, communicating with the stomach and capped by a solid mass of tissue 0 5 cm in height (Fig 1) A gap, 2 7 cm in length, separates the two segments and has only the loose areolar tissue of the mediastinum No communication or connection can be demonstrated either between the esophageal segments or to the tracheobronchial tree

Both lungs have an extensive acute pneumonia

The other organs show nothing of note No other anomalies are present

The entire midportion of the specimen, including the lower trachea and main bronchi, was removed en masse, blocked in toto, cut in serial section and examined No remnant of esophageal or tracheobronchial structure or fibrous cord could be found between the pouches, nor was there any esophageal structure buried within the tracheobronchial wall

Diagnosis —Atresia of mid third of esophagus without tracheobronchial fistula, acute bronchopneumonia

Congenital anomalies of the esophagus are comparatively rare but have recently been reported in increasing numbers Shukofsky and Baron, quoted by Cautley, stated that they occurred once in every 50,000 births [1] Among 20,000 births in the Maternity Hospital of San Giovanni at Rome, there was one [2] There were none in 30,000 births at Nancy [3] Reynolds and Morrissey reported that only one was seen in Bellevue Hospital in sixteen years [4] Guy Turner, quoted by Guthrie, found four among 10,543 births at the British Postgraduate School of Medicine [5] Rosenthal reported three in 2,400 deliveries [6] At the Babies Hospital, New York, there were 27 cases in twenty years [7]

The incidence at autopsy is more frequent but still uncommon Polson in 12,000 autopsies in Leeds General Infirmary encountered one case [8] Gajano found two in 900 autopsies performed at the Institute of Pathological Anatomy of Naples [9] In the Royal Hospital for Sick Children in Glasgow, among 6,916 autopsies, Guthrie found 38 esophageal malformations [5] At New York City Hospital, Welfare Island, there were three among 5,158 autopsies

Esophageal anomalies are now conceded to be due

FIG 1 Esophageal atresia The mid third of the esophagus is lacking The lower pouch is capped by a solid mass (arrow) of tissue

to development errors It is also recognized that sites of greatest embryologic events are those most prone to exhibit anomalous development The embryology of the esophagus and its anomalies has been well covered by Rosenthal Plass Abel, Vinson and others and has been summarized by Lanman [6,10–14] Both the esophagus and trachea are formed by a single tube of the primitive foregut. At the site where the tracheal bifurcation will be the lung buds develop from the anterior wall and the foregut becomes divided into two portions by longitudinal projections from the lateral walls Complete fusion of the projections forms the esophagus and tracheobronchial segments Incomplete fusion leads to the various anomalies reported.

The classification of esophageal anomalies most frequently followed in the American literature is that of Vogt, who divided them into three groups (1) complete absence (2) upper and lower pouches without tracheo-esophageal fistula and (3) upper and lower pouch with tracheo-esophageal fistula.[15] Plass's classification is more elaborate but includes all types of anomalies from complete absence of the esophagus to that in which the trachea and esophagus form a single sac. Abel gives an excellent schematic representation of various anomalies.[12]

There are many excellent reviews of the literature bringing the total number of reported cases to about 400 in number [6 10 16–19] The great majority 70 to 80 per cent comprises the malformation of an upper blind pouch and a lower pouch with a fistula to the tracheobronchial lumen [6 16–18] Those without fistula although less common form a not inconsiderable number In Plass's paper 20 instances are mentioned [16] Cautley quotes 20 Huntington 11 and Rosenthal 40 among 255 cases

Total absence of the esophagus to the best of our knowledge has not been reported in the last twenty-seven years There have been many cases of esophageal atresia without fistula They have one feature in common an upper pouch. The main deformity has always been in the lower portion a localization similar to the more common tracheo-esophageal fistula. The atresia of which there have been 12 instances has usually consisted of a cord connecting the pouches [6 14 17 26–27] There has been no connection between the pouches, as was true of the present case in a smaller number [5,8,9 14 28–32] In a few examples there has been only an upper pouch connected to the cardia by a cord or without any connection [9,33,34,35] In Cajano's case, a small solid mass of esophageal tissue lay above the diaphragm a mass similar to that capping the lower pouch in our case Carothers reported a more unusual anomaly [36] A fibrous band connected the upper pouch with the duodenum completely replacing the lower esophagus the entire stomach, and part of the duodenum.

Other types of anomalies are less common. Chapman reported a muscle band causing complete obstruction between the pouches.[6] A congenital membrane was found by Abel Perrault and Burman, and Fitzgibbons [12,37,38] Morse saw two cases with dilatable strictures apparently of congenital nature [39] Similar cases have been reported by Vinson and Fitzgibbons.[20,33] In other instances such as four cases of Humphries three of Ladd and one of Maes the absence or presence of connecting tissues between the pouches is not clear from the published data [7 40 41] There are some cases in the literature of doubtful nature although interpreted as congenital atresia by the authors.[42–46]

The occurrence and significance of congenital anomalies of other organs associated with malformations of the esophagus have led to conflicting conclusions. Plass found a high incidence [16] Humphries stated that they were infrequent and of no special significance, ten of his cases however had other anomalies although only one was of importance.[7] Ladd on the other hand found anomalies in 47 of 72 cases, many of which were serious and some incompatible with life [40] Many of the cases reported individually had no other anomalies.

Heredity probably plays no part, except in rare instances. One of Morse's cases was the brother of Rotch's patient.[39] Ealing stated that the child of an aunt had symptoms similar to his patient and died soon after birth [46]

Hydramnios has been deemed significant of anomalies of the digestive system by some observers.[6 27] Its occurrence has been noted by several.[33,47] Plass claimed it was only incidental since he found that it was present in only nine of the cases he reviewed Possibly it may be of value only as a warning to be prepared for a congenital anomaly should the child develop any of the characteristic symptoms.

The symptoms of esophageal atresia are characteristic.[6 14 17 48] The child usually appears perfectly healthy at birth and presents no external anomalies. If one is present it usually is anal or rectal atresia [14 21,22 49 48] There is early constant, excess mucus in the nasopharynx. Attacks of choking and cyanosis occur within a few hours of birth and are almost invariably precipitated by feeding Usually there is great eagerness for food but each feeding causes regurgitation and strangling. The sole exception to this group of symptoms was presented by Neff's patient in whom there was neither choking or cyanosis The abdomen is flat because the stomach does not contain air which is present with tracheo-esophageal fistula The stool consists of meconium and lacks cornified epithelium Farber has devised a special staining technic for its demonstration [50]

Esophageal stenosis tends to present a different *symptom complex from esophageal atresia.* The onset is usually later and may occur first in late infancy or even in childhood The most characteristic symptom is a vomiting habit The patient is usually underdeveloped physically and may subsist only on a soft or liquid diet due to inability to take solid foods without vomiting.

Roentgenologic examination is of great value and will demonstrate the upper pouch The pouch is visualized usually by the use of a barium mixture but because of the danger of pneumonia from aspiration many roentgenologists prefer lipiodol Furman and his coworkers advocated aeresophagoscopy without the use of any contrast medium since even the use of an iodized oil has its hazards [51] Selander

stressed the use of a lateral view of the thorax [52] The dilated upper pouch, according to him, causes compression and displacement of the trachea, a finding sufficient to justify a diagnosis of esophageal anomaly Absence of an air bubble in the stomach usually indicates that a tracheo-esophageal fistula is not present, although in a case of Haight and Townsley with fistula there was no air bubble in the stomach [53] Findlay voiced a word of caution in the interpretation of the roentgenologic findings they are similar in spasm and in congenital short esophagus [54]

Esophagoscopy has been employed for direct visualization and has proved of value particularly in stenotic conditions

Surgery offers the only satisfactory therapy for esophageal atresia The early attempts were unsuccessful, but within the last few years they have been more satisfactory [55–57] The technical features have been thoroughly covered in several articles and are beyond the scope of this paper [7 14 40 53 58] Suffice it to say that success depends on early diagnosis and the prevention of pulmonary complications from aspiration, particularly from the excessive mucous secretion of the upper pouch

Gradual dilatation of stenotic lesions has proved successful, particularly in older infants and children [20 38 39] Congenital membranes found during esophagoscopy have been punctured during the examination and followed by dilatation [12 37]

Summary and Conclusions

A case of congenital atresia of the esophagus from absence of mid third without tracheo-esophageal fistula is reported, and the pertinent literature is reviewed

Thanks are due to Dr A H Aldridge for permission to use the clinical data of the case presented

OUTLINE PLAN TO REPLACE PHYSICIANS

Dr Paul Magnuson, medical director of the Veterans Administration, reported that a plan has been worked out to replace the thirteen hundred physicians on loan from the Army and Navy who are expected to leave the agency this summer Outgoing military physicians will be replaced by three-year resident physicians

To assist the agency and simultaneously broaden opportunities for residents, prospective specialists will serve their final two years in veterans' hospitals, practicing under the supervision of certified consultants The agency now has a residency program covering the first three years of the specialty apprenticeship The advanced program will provide salaries from $4,100 to $7,000 annually —*J A M A , April 17, 1948*

NECROLOGY.

Alonzo Eugene Austin, M.D., New York City died June 20 at the age of eighty. Dr. Austin was graduated from New York Homeopathic Medical College in 1897. He had been a professor of materia medica at the New York Homeopathic Medical College and Hospital and was a staff member of Roosevelt Hospital and at Sloane Hospital for Women. Dr. Austin was a member of the American Institute of Homeopathy and the New York State and County Homeopathic Medical Societies.

Henry Pelouze de Forest, M.D., eighty-three, died at his New York City home on June 13. Dr. de Forest, who retired in 1947, received his medical degree from the College of Physicians and Surgeons, Columbia University, in 1890. He later studied and practiced at universities and hospitals in Vienna, Freiburg, Paris, Dublin, Edinburgh, Dresden and Berlin and served on the staff of Sloane Hospital for Women, New York City.

Dr. de Forest served as police surgeon from 1902 to 1912, as chief medical examiner of the Municipal Civil Service Commission from 1912 to 1919, and from 1917 to 1928 he held membership on the medical board of the Teachers Retirement Board. Dr. de Forest is credited with the establishment of the first fingerprint file in the United States. During the Spanish-American War, he was acting assistant surgeon of the Third Division Hospital. He also held the rank of major retired in the medical corps of the New York State Guard. From 1903 to 1921 he served as associate professor of obstetrics at New York Post-Graduate Hospital and Medical School. Dr. de Forest was a member of the New York Academy of Medicine, the Brooklyn Pathological Society, the American Medical Association and the New York State and County Medical Societies.

Edwin Howe Fiske, M.D., died at his home in Brooklyn on June 15. He was seventy-one years old. Graduated from Long Island College Hospital in 1901, Dr. Fiske interned at Kings County Hospital, after which he continued his studies at the University of Vienna. He joined the staffs of Kings County and Holy Family Hospitals in 1904, serving as head of the medical boards of these hospitals from 1912 to 1934. In 1917 he organized and headed an overseas medical unit from Kings County Hospital which set up Base Hospital 37 in Dartford, England.

Dr. Fiske served as consulting surgeon on the staffs of Mercy Hospital, Rockville Centre; Kings County and Bushwick Hospitals, Brooklyn, and Eastern Long Island Hospital, Greenport. Until 1938 he served as director of surgery at Holy Family Hospital, Brooklyn. He also had been professor of clinical surgery at the Long Island College Hospital and had taught at Bellevue Medical College. An organizer and charter member of the American College of Surgeons, he was a member of the Brooklyn Surgical Society, the American Medical Association, and the New York State and Kings County Medical Societies.

Frederick Howell Greene, M.D. of Poughkeepsie died on June 12 at the age of seventy-five. Dr. Greene was graduated from Albany Medical College in 1897. He served on the consulting staffs of Vassar Brothers and St. Francis Hospitals, Poughkeepsie, and was a member of the American Medical Association and the New York State and Dutchess County Medical Societies.

Anton Frederick Mannel, M.D., fifty-six, died at his home in Center Moriches, Long Island, on June 22. Dr. Mannel was graduated from New York University and Bellevue Medical School in 1914 and practiced medicine in Brooklyn for many years before becoming a resident of Center Moriches six years ago.

Otto Marburg, M.D., New York City, died on June 13. His age was seventy-four. Dr. Marburg, a native Austrian who fled the Nazis in 1938, was graduated from the University of Vienna in 1899. He continued his studies under Hans Oberstoiner, Wagner-Jauregg, Herman Oppenheim and Pierre Marie. He became a member of the staff of the Neurological Institute of the University of Vienna in 1905, was a full professor from 1916 to 1919 and was appointed director of the institute in 1919. During World War I he made an intensive study of injuries to the nervous system occurring in combat.

Noted in the field of neurology, Dr. Marburg had published numerous books and articles on neuroanatomy and neuropsychiatry, one of which was *Microscopic Topographic Atlas of the Central Nervous System* published in 1908 and considered a classic.

In this country Dr. Marburg became an American citizen and at the time of his death was a clinical professor of neurology at the College of Physicians and Surgeons, Columbia University, and a neurologic consultant on the staffs of New York Post Graduate and Montefiore Hospitals. A diplomate of the American Board of Psychiatry and Neurology, Dr. Marburg was an honorary member of the American Neurological Association, the New York Neurological Society, the Philadelphia Neurological Society, the Vienna Medical Society, the Neurological and Psychiatric Society of Argentina, and the Japanese Society of Neurology and Psychiatry. He was also vice-president of the International Neurological Congress and a member of the Academy of Sciences of France, the American Medical Association, the New York Academy of Medicine and New York State and County Medical Societies.

Ray Sixtus Nelson, M.D., died at his home in New York City on June 18. He was sixty-four years old. Dr. Nelson was graduated from Syracuse University Medical School in 1911 and interned at New York Skin and Cancer Hospital and was professor of dermatology at that hospital from 1915 to 1929. During the first World War he served as a major in the Army Medical Corps assigned to the port of embarkation in Brest, France and did research during the influenza epidemic in the fall of 1918. Dr. Nelson had also been attached to the former Neurological Hospital and to City Hospital on Welfare Island. He was pathologist for St. Francis Hospital and director of Cooper Laboratory, New York City. Dr. Nelson was a fellow of the New York Academy of Medicine and a member of the American Medical

Association, the New York Pathological Society, and the New York State and County Medical Societies

Olga Raissa Povitzky, M D, of New York City, seventy-one, died on May 21 Dr Povitzky was graduated from the Women's Medical College of Pennsylvania in 1901, and, following a period of private medical practice in New York City, she joined the City Department of Health In World War I she served with the U S Army in the women's medical unit in France For many years Dr Povitzky had charge of the manufacture of diphtheria toxoid at the William H Park Memorial Laboratory and had also experimented in serum research in an effort to combat influenzal meningitis She was a member of the American Association of Immunologists, the Society of American Bacteriologists, the American Public Health Association, and the New York Academy of Medicine

Anna Magilowa Reinstein, M D, died on June 21 at her home in Buffalo at the age of eighty-two Dr Reinstein, a physician for fifty-seven years before her retirement last February, was a graduate of the University of Berne in 1891

William M Smith, M D, of Olean, died at his home on May 29 He was forty-seven Dr Smith was graduated from the University of Buffalo, School of Medicine, in 1924 and took up medical practice in Olean In 1937, he joined the staff of the New York State Health Department During World War II, Dr Smith served with the Army Medical Corps with the rank of major and was assigned to the Army Air Forces At the close of the war he became chief of the Division of Preventive Medicine, State Department of Health, North Dakota, and, subsequently, acting state health officer He resigned that post and returned to Olean, resuming practice in March, 1947 He was on the staffs of Olean General and St Francis Hospitals, Olean Dr Smith was a member of the American Public Health Association, the American Medical Association, and the New York State and Cattaraugus County Medical Societies

William Henry Sugarman, M D, Brooklyn, died on June 23 at the age of sixty Dr Sugarman was graduated in 1914 from Cornell University Medical School A diplomate of the American Board of Internal Medicine, he was an associate physician on the staff of Jewish Hospital and had received an appointment, effective July 1, as an associate in medicine at Long Island College of Medicine Dr Sugarman was a member of the American Medical Association and the New York State and Kings County Medical Societies

Willis Ashton Tenney, M D, ninety-five, retired surgeon of Granville, died on June 12 Dr Tenney was graduated from the University of Vermont Medical School in 1877 He was a specialist in diseases of the eye, ear, nose, and throat and had practiced in Granville for more than sixty-five years when he retired in 1941 He was a member of the American Medical Association and the New York State and Washington County Medical Societies

Stephen Whitaker Wells, M D, died on May 21 at his home in Liberty at the age of seventy-two Dr Wells was graduated from the College of Physicians and Surgeons, Columbia University, in 1896 and interned at Paterson General Hospital, Paterson, New Jersey He had practiced medicine in Liberty for over fifty years He was also a physician on the staff of Maimonides Hospital, Liberty He was a member of the American Medical Association and the New York State and Sullivan County Medical Societies

August W F Westhoff, M D, Queens, aged eighty-seven, died on February 21 He was graduated from Bellevue Medical College in 1891 Dr Westhoff was director emeritus of the Medical Department of Wyckoff Heights Hospital, chief physician at Bethany Deaconess Hospital, and pathologist at St Catherine's Hospital, Brooklyn A fellow of the American College of Physicians, Dr Westhoff was also a member of the American Medical Association and the New York State and Kings County Medical Societies

---

MEDICAL LICENSES REVOKED AND SUSPENDED

The Board of Medical Examiners of the State Education Department has notified the State Department of Health of action taken recently by the Board of Regents with respect to the medical licenses of the following persons

Gaspare Genova, 1257 70th Street, Brooklyn License suspended for one year, effective December 11, 1947

Leopold W A Brandenburg, 2802 Hudson Boulevard, Union City, New Jersey License permitting him to practice medicine in the State of New York revoked, effective November 25, 1947

Anne Elizabeth Kuhner, 52 Gramercy Park North, New York City License revoked, effective December 5, 1947

Boris Schlaifer, 2001 Strauss Street, Brooklyn License revoked, effective December 3, 1947

HOSPITAL NEWS

Ambulance Service to Be Considered in Hospital Planning

THE Hospital Council of Greater New York in its *Bulletin* issued June 25 stated that "changes in ambulance service hospital facilities, and related services are considered not as separate entities but as related functions and part of an over all community service

It was pointed out in the *Bulletin* that ambulance service is a transportation factor to be considered in hospital planning. The article stated that 'the significant feature of the ambulance service to be noted is the marked decrease in the total number of calls made after 1941 '

'Prior to 1942 doctors (usually interns regularly assigned to the ambulance service for specified periods) rode with the ambulance on every run, the *Bulletin* stated 'Many patients were discovered who did not need hospitalization or even emergency treatment in the hospital it continued, and the result was that the ambulance physicians treated many patients in the homes and did not take them to the hospital.

It was pointed out that in 1941 nearly 60 per cent of the total ambulance calls were in the category 'Treated and Not Removed. '

"With the coming of the recent war, the *Bulletin* continued, and the great demand for doctors in the armed services, it was decided to replace the ambulance physicians by trained attendants. With this change the home care function of the ambulance stopped and the service reverted to the sole function of transporting the sick and injured to the hospital. The *Bulletin* pointed out that calls in this new category Not Removed now represent less than 15 per cent of the total number of emergency calls

At the present time the city pays the voluntary hospitals which provide emergency ambulance service for the maintenance of each vehicle. The *Bulletin* commented that this payment is not intended to defray the cost of actual care rendered to the patients after admission As may well be expected many of the patients admitted by ambulance have little or no financial means for paying the hospital The city accepts these cases as city cases. Thus, the 'voluntary hospitals maintaining an ambulance service have contributed more to the community than is represented in the cost for maintaining the ambulance.

U S Approval Given to State Hospital Coordination Plan

THE State's long range plan for hospital construction, estimated to cost more than $750 000 000 has been approved by the Federal Public Health Service, Dr Robert T Lansdale, chairman of the State Joint Hospital Survey and Planning Commission, announced on June 20

This action paves the way for an $18,000 000 hospital building program in the next year, which will be financed with $6 000 000 of Federal funds and $12 000 000 from sponsors of local projects

Dr Lansdale said that the regional councils of the Hospital Planning Commission which drafted the plan were distributing applications for Federal funds to sponsors in high priority areas. Each application will be evaluated by the councils which will make recommendations for final action to the commission. The first approval is expected about August 1

The plan is based upon use of existing public and private nonprofit hospitals as far as possible It calls for

An additional 54 000 beds for general, chronic, and tubercular patients through construction of new hospitals and expansion of present institutions which meet modern requirements

Working arrangements between hospitals in seven regions to bring specialized services and the latest medical developments closer to the local doctor and his patients.

Fewer but larger better equipped and staffed general hospitals placing greater emphasis on disease prevention

A suitable general hospital within 15 miles of any populated point in the State.

Coordination of hospital facilities with existing medical schools and research laboratories

Primary centers of the hospital service regions are Buffalo Rochester Syracuse Albany, and New York City

Increased Interest in Psychiatric Training Report Shows

THERE were more doctors and nurses in training in the Westchester Division of New York Hospital last year than in 1946—a reflection of increased interest in psychiatric training according to the annual report of the Division published in June At the same time because of necessary building closings for repairs there were fewer patients cared for in 1947 than in the year before

Dr James H Wall, medical director, stated that although real progress has been made in clinical research, the hospital is handicapped by being short at least two fulltime staff members trained in research technics and by scattered laboratory facilities

Of the 275 new patients admitted during 1947, 218 or 80 per cent were residents of New York City and vicinity Included were 72 from Westchester World War II veterans among new patients numbered 29 Fifty-three per cent of the patients admitted during the year were discharged in six month's time or less Eighty-two per cent were discharged in less than a year's time

Analysis of admission diagnoses showed percentages of patients for various causes as follows manic-depressive psychoses, 29, schizophrenia, 23, psychoneuroses, 16, mental disorders associated with the involutional period, 8, alcoholism, 7

Merger of Ossining, Dobbs Ferry, and Tarrytown Hospitals Recommended

UNQUALIFIED assertion that a merger of the Ossining, Dobbs Ferry, and Tarrytown Hospitals is desirable, both from the standpoint of improving the services and limiting the deficit, has been made by a survey committee from the three hospitals

The study was made by Dr Claude W Munger, former head of Grasslands Hospital, William J Donnelly, expert on hospital management, and Charles W Davidson, a certified public accountant

In opening the study of the proposed merged hospital, the survey staff defined its area of coverage as from the northern line of Yonkers to the northern line of Croton, lying between the Hudson River and the Saw Mill River Parkway and Bronx Parkway Extension This area averages three miles in width and 18 miles in length, a total of about 54 square miles

Broken down to the current situation, the Tarrytown Hospital serves a population of 20,908, Ossining, 21,486, and Dobbs Ferry, 18,626

In relation to the generally accepted standard of 4 5 beds per 1,000 population, the report says, "all three hospitals now fall short of supplying the theoretical bed need" The combined hospitals, according to this computation, have a total bed capacity of 168, which is 106 4 under the accepted standard

City Will Test Music Therapy for Mentally Ill

AN EXPERIMENT in the use of music by swing bands, string ensembles, and other groups as a therapeutic measure to aid mentally disturbed persons was started on July 7 at Kings County Hospital, Brooklyn

Announcement of the project was made jointly by Dr Edward M Bernecker, Commissioner of Hospitals, and Richard McCann, president of Local 802 It will be the first such project in a New York City hospital

The music will be provided without charge by Local 802, American Federation of Musicians, an affiliate of the American Federation of Labor The musicians will be paid from funds collected by the union as royalties on records and transcriptions

Dr Sam Parker, director of psychiatry for the Department of Hospitals, is in charge of the new program He was circumspect about its possible results, but said that the objective is "to use music as a general environmental influence and to create an altered emotional atmosphere for the patients"

Dr Parker emphasized that the city was embarking on the project with no preconceived notions or plans, since the use of music to aid mentally disturbed persons has been tested only superficially thus far Kings County Hospital has more than 300 mental patients but only about half of them—those less seriously ill—will receive the musical therapy

One group of musicians will play jazz music for children and adolescents under psychiatric observation and treatment "with a view to determining the comparative values of different forms of music in the handling of youthful problems," Dr Parker said

Another ensemble will play semiclassical numbers and old favorites for adult patients "and thus provide a basis for studying the influence of music in various types of mental and emotional conditions," Dr Parker added

Free Health Center to be Established for Hotel Employes

THE New York Hotel Trades Council and the Hotel Association of New York City announced jointly in June that the property of the Y W C A at Fifteth Street and Tenth Avenue, New York City, had been bought for a new health center

According to Fred O Cosgrove, president of the association, 30,000 union employes of 150 hotels are scheduled to receive free treatment at the center Among the services will be general medical specialist care, laboratory and diagnostic procedures, periodic health examinations, immunizations, and other disease prevention measures

Money for purchasing, remodeling, equipping and maintaining the property and its staff will be provided by the hotel operators

This is an extension of the benefit program started in 1946, when a fund was established to provide life insurance and weekly sickness and accident benefits for employes and hospitalization for employes and their families

A joint association-council board of directors will govern the center with medical supervison under licensed physicians Selection of the director and staff will be by the board

NEWS NOTES

Every aspect of the work of Beth Israel Hospital New York City increased during the past year, according to the hospital's annual report A total of 9 254 patients, exclusive of the newborn, received 94, 669 days of medical care at the hospital during the year In addition 2 781 babies were born in the hospital during 1947, a record number, which may reflect the peak of the postwar birth rate Visits to the 41 clinics of the outpatient department increased by almost 10 per cent to 69 033

Completion of Millard Fillmore's ten-story modern addition in Buffalo a $980,000 structure requiring two years to build was celebrated by the hospital staff at a dinner June 3

Commenting on Millard Fillmore's growth Dr Harvey P Hoffman president of the medical staff and toastmaster, said On July 1 the entire hospital will be serviced by 25 resident physicians and 15 interns. The new laboratories on the sixth floor are equipped to furnish up-to-date data in bacteriology, biochemistry, basal metabolism electroencephalogy and serology Our x ray department is one of the finest in the state

During an outline on hospital procedures, Dr Hoffman praised the creation of a Research Committee under the chairmanship of Dr John Stewart professor of surgery at the University of Buffalo

The newly enlarged and renovated Moses-Ludington Hospital of Ticonderoga was opened for public inspection May 12 National Hospital Day according to an announcement by Charles A Hunt president The hospital as a result of the completed enlargement project, is now an ultramodern 80-bed facility, one of the finest of its size in the State and comparable in equipment and design with leading hospitals throughout the country Mr Hunt said

On the fortieth anniversary of its origin Goshen Hospital, started as an emergency measure to serve accident cases had a house full of babies, as well as medical and surgical patients, and announced the acquisition of baby handling equipment of the most modern and efficient type

In connection with the announcement it was revealed that Goshen Hospital has been entirely free of the infant diarrhea which recently has become a serious menace to the newborn Miss Ethel Low hospital superintendent, said

Walton Hospital Committee, a group of citizens interested in promoting the construction of a hospital in the village, has taken a decisive step toward the completion of its planning.

The committee has sent a request to Dr Basil C McLean a hospital consultant and director of Strong Memorial Hospital, Rochester to conduct a survey of hospital needs in the community He will advise the committee concerning the number of beds needed and how large the hospital should be

Dedication of a cornerstone for St Clare's new hospital in Schenectady was held June 13, with the Most Rev Edmund F Gibbons Bishop of the Albany Catholic Diocese officiating

A cancer detection center for Meyer Memorial Hospital in Buffalo is to be established in July, according to an announcement from Dr Elmer Friedland, who will be director of the center The center will be under the supervision of the hospital's staff tumor committee and will not provide therapy but will furnish a thorough physical examination with emphasis on the discovery of malignant diseases. Funds for the center were allocated by the New York State Division, American Cancer Society

At the beginning the center will conduct one session a week on Tuesday from 5.30 to 9.30 P M If additional sessions are required they will be conducted on Thursday evenings at the same hours Those over 30 years old will be eligible for examination but any person recommended by a physician will be accepted regardless of age Dr Friedland declared He added however that no person under treatment for cancer will be accepted

A recommendation for 115 more hospital beds for Rensselaer County and the need for 250 more tuberculosis hospital beds in the area suggesting enlargements of the Pawling Sanitarium, are contained in a coordinated State-wide hospital plan announced in June

The plan announced by the State Joint Hospital Survey and Planning Commission designated Troy and Rensselaer County as secondary or intermediate centers in the coordinated hospital plan. The report shows that Rensselaer County has a total of 627 hospital beds of which 503 are suitable and 124 unsuitable for long-range planning.

During the last ten years Our Lady of Victory Hospital Lackawanna has more than doubled the demands on its facilities according to a recent release from the hospital which points up the need for the new five-story addition In 1947 there were almost 5,100 admissions as against slightly more than 2 500 in 1937

The Dansville General Hospital will become Dansville Memorial Hospital, dedicated to honor Southern Livingston County's dead of World Wars I and II and provide an opportunity for perpetuating the memories of all loved ones in a way that will help others to live Hospital President James J Blum announced in June

Directors of the hospital took necessary action at a recent meeting to permit the change and the new name will become official with the erection of a new wing and the rehabilitation and modernization of the plant. The Dansville Memorial Hospital will be a modern 60-bed unit

MEDICAL NEWS

Follow-up Program to Check TB Relapses in Veterans

ON JUNE 21, the Veterans Administration began a "follow-up" program to discover if there have been any relapses among veterans suffering from tuberculosis The program is designed to help prevent advanced disease and thus contribute toward safeguarding others through control of communicable tuberculosis

Each veteran-patient, before he is discharged from a veterans' hospital, will be urged to report at regular intervals for x-rays, fluoroscopic examinations, and other checks or treatments More than 13,000 veterans suffering from tuberculosis now are under VA care Another 80,763 are receiving compensation or pensions

Medical Officer Examination Announced

THE U S Civil Service Commission has announced an examination for filling medical officer (rotating intern and psychiatric resident) positions in St Elizabeth's Hospital, Washington, D C

Medical officers (rotating intern) are paid $2,200 for the first year and $2,400 for the second year Medical officers (psychiatric resident) are paid from $2,400 to $4,100 a year, depending upon the amount of approved postgraduate training the applicant has completed

Appointments are open for July 1, 1949 Internships consist of two years of rotating service, and psychiatric residencies consist of one to three years in psychiatry

To qualify for internships, applicants must be third or fourth year students in an approved medical school, however, they may not enter on duty until they have successfully completed the full course of study Applicants for psychiatric residencies must be graduates of an approved medical school, with the degree of doctor of medicine, and, in addition, they must have completed an approved internship or must now be serving such an internship No written test is required for the medical officer positions

Interested persons may secure information and application forms from the U S Civil Service Commission, Washington 25, D C, from most first- and second-class post offices, and from Civil Service regional offices Applications will be accepted until further notice in the Commission's Washington office

College of Physicians Offers Research Fellowships

THE American College of Physicians announces that a limited number of fellowships in medicine will be available from July 1, 1949, to June 30, 1950

These fellowships are designed to provide an opportunity for research training either in the basic medical sciences or in the application of these sciences to clinical investigation They are for the benefit of physicians who are in the early stages of their preparation for a teaching and investigative career in internal medicine

Assurance must be provided that the applicant will be acceptable in the laboratory or clinic of his choice and that he will be provided with the facilities necessary for the proper pursuit of his work The stipend will be from $2,200 to $3,200

Application forms will be supplied on request to the American College of Physicians, 4200 Pine Street, Philadelphia 4, Pennsylvania, and must be submitted in duplicate not later than November 1, 1948 Announcement of the awards will be made as promptly as possible

Postgraduate Work in Orthopedic Surgery Offered

PHYSICIANS seeking postgraduate work in orthopedic surgery will have an opportunity to study at the Hospital for Joint Diseases, New York City, according to an announcement by Frederick Brown, president of the board, and Dr J J Golub, executive director of the hospital

The course, being offered in affiliation with Columbia University, will consist of eleven morning and eleven afternoon sessions held on consecutive Thursdays, beginning October 7, and ending December 23, 1948

The curricula will include a series of lectures, case demonstrations, and conferences on the clinical, diagnostic, therapeutic, pathologic, bacteriologic, chemical, and radiologic aspects of skeletal disease, so integrated as to present a general review of the modern concept of the more important orthopedic diseases.

There will be opportunity for clinical examination of patients

Applications for registration should be made to the office of the assistant dean, graduate medicine, Columbia University, College of Physicians and Surgeons There is a fee

Obstetrics and Gynecology Changes in Board Requirements Made

A NUMBER of changes in Board requirements and regulations were made at the annual meeting of the American Board of Obstetrics and Gynecology, held in Washington, D C, from May 16 to May 22. At that time 231 candidates were certified.

Now bulletins are now available for distribution upon application and give details of all new regulations. These relate both to candidates and to hospitals conducting residency services for training

Foremost are the following

1 The ruling that applicants must receive adequate training in both obstetrics and gynecology has been defined as meaning a minimum of six months full time, in the branch of either obstetrics or gynecology relegated to a minor role in a candidate s training and preference for practice.

2 Acceptable preceptorship training is defined

3 The present regulation requiring at least six months of practice in the specialty following the completion of an acceptable training period has now been extended effective December 31 1949 to a requirement of two years post training practice limited to the specialty

4 Specific requirements for approval of hospital services for residency training are outlined

5 Effective immediately, there will be no further temporary approvals of hospital services for residency training. It is planned that all hospitals holding any type of residency training approval will soon either be resurveyed or initially surveyed by the Council on Medical Education and Hospitals of the A.M.A., so that all future approvals new or old, will be based entirely upon inspection following application It is expected also that certain resurveys will result in withdrawal of present residency approval from institutions where the educational and training standards are not being maintained

The next scheduled examination (Part I) written examination, and review of case histories for all candidates will be held in various cities of the United States and Canada on Friday, February 4 1949 Application may be made until November 1 1948 Application forms and bulletins are sent upon request made to American Board of Obstetrics and Gynecology Inc. 1015 Highland Building Pittsburgh 6 Pennsylvania.

U.S Grants $1,000,000 for Cancer Research

A BOUT $1 000,000 of Federal money was granted in June to 86 institutions for cancer studies The projects cover a wide variety of investigations, including use of radioactive materials against cancer Some of these have become more abundant as a result of the Government s atomic plants.

The grants were approved by the National Advisory Cancer Council and the United States Public Health Service The largest, for $85 064 goes to the University of California Medical School at San Francisco for a study of the value of chemical compounds in treating cancer

The College of Physicians and Surgeons at Columbia University New York, received $23,400 for studying breast cancer in mice and human beings and $8,370 for study of virus growth in tumors.

Memorial Hospital for Treatment of Cancer, New York, received $30,000 St. Vincent s Hospital New York $10 000 Haskins Laboratories New York $5,690, Overly Biochemical Research Foundation New York $14 004 New York University $6 023 Montefiore Hospital, New York $10,000 and New York Zoological Society, New York $6 046

Heart Research Aided by Grants

AN ADDITIONAL $103,000 in research funds for heart disease was announced by the Life Insurance Medical Research Fund New York City, raising to nearly two million dollars the amount provided by the Fund since its organization in December 1945 The awards, announced by M Albert Linton, chairman of the Fund include 12 student fellowships, three postgraduate fellowships and nine grants-in-aid to hospitals and universities.

Purpose of the fellowships, Mr Linton announced, is to help meet today's pressing need for qualified men and women trained in research technics. Student fellowships, amounting to between $1 500 and $1,800 go to students who have not yet received their doctorate degrees and provide for a year's additional undergraduate training under leading scientists Postgraduate fellowships amounting to between $2 500 and $4 000 go to graduate workers for similar study

Largest grant-in-aid announced by the Fund today is $18 375, which will go to Western Reserve University in Cleveland for research by Dr Normand L. Hoerr

To date, the Fund has made 103 grants in aid to forty-eight medical schools and has provided support for sixty research fellows The June list of awards is the second announced this year and brings the 1948 allocations to $637,000

Grants awarded in New York State went to Dr Jean Oliver, Long Island College of Medicine for research on the structural aspect of the metabolic process of the nephron to Dr Jane Sands Robb, Syracuse University College of Medicine, for research on the structure and function of the conducting system of the heart, and to Ardent Albert Flint, Jr, Loudonville to work under the supervision of Dr Harold G Wiggers at Albany Medical College.

ABSTRACT OF MINUTES OF THE COUNCIL OF THE MEDICAL SOCIETY OF THE STATE OF NEW YORK

THE Council held its organization meeting on Wednesday, May 19, 1948, in Room 111, at the Hotel Pennsylvania, New York City The following matters were considered

Secretary's Report

Remission of State Assessments —Remission of State assessments was voted on account of service with the armed forces for three members for 1948 and nineteen for 1947, also on account of illness for the following members according to county Bronx Charles E Haynes, 1948, A L Wincor, 1948, S H Nerenstone, 1948 Broome Palmer L Auker 1947 and 1948, Roger D Mead, 1948 Kings George F Herrity, 1947, Anne Cowan, 1947 and 1948, Stanley B Doyle, 1947 and 1948, Meyer D Rosenblum, 1947 and 1948, Julius B Boehm, 1948, J Arthur Buchanan, 1948, Jacob Sachs, 1948, James A Cooley, 1948 New York Katherine Siegel-Fuerst, 1948 Westchester James H Bannon, 1948

The rescinding of dues for 1946 for one member was authorized

Request from Dr David F King to be nominated for Affiliate Fellowship in the American Medical Association was granted

Communications —1 Letter from Mr H F Wanvig, Indemnity Representative, requested permission to employ Mr Linder to assist in establishing proposed improvements in Mr Wanvig's office

After discussion *it was voted* that the Council had no objection to Mr Linder's being employed by Mr Wanvig

2 Letter from Dr Conroe, Assistant Commissioner of Education, to Dr Anderton, dated April 26, 1948, as follows

This letter is in respect to your inquiry of April 7 hitherto acknowledged.

(1) It is the policy of the Board of Regents in most instances to license without further examination applicants who have been graduated from continental European medical schools who completed their medical education and requirements for licensure in Europe prior to 1914 This policy was established on the ground that medical education in most parts of Europe particularly in Austria and Germany was at its peak prior to 1914 and was fully the equivalent of that in effect in our State at the same time.

(2) The only European medical school graduates beginning their medical education after January 1 1940 who are considered eligible for admission to New York State medical licensing examination without further study or training are graduates from the medical schools of London University Cambridge University the National University of Ireland and the University of Dublin Occasional graduates of the University of Edinburgh, School of Medicine may be admitted to our licensing examination depending upon what is revealed in their records of study and training.

(3) Graduates of other European medical schools *matriculating after January* 1 1940, are required to take additional study or a minimum of two years of rotating internship or rotating residencies in approved hospitals before being considered eligible for admission to our medical licensing examination.

(4) Meanwhile it is our policy to advise any students seeking such information that we can give them no assurance at all to the effect that they will be eligible for admission to our licensing examination upon completion of a course of study in medicine in continental European schools unless by the time of the graduation of such students such schools have recovered satisfactorily and rather fully from the effects of the recent war There are numbers of students in continental European schools today who are there strictly of their own volition and without assurance from us that their records will be honored when they return here

Dr Anderton suggested "that the Council protest to the Board of Regents in the name of the State Society that the policy in granting licensure to practice medicine without examination to graduates from European medical schools who have graduated prior to 1914 is contrary to the interests of the public" Dr Simpson questioned the legality of it

It was voted that Dr Anderton answer the letter in the spirit of this discussion according to the facts that have now been brought before the Council

Treasurer's Report was accepted

Report of Executive Officer

Dr Hannon, Executive Officer, reported that he was arranging for Executive Committee meetings of the District Branches and that the first such meeting was held June 3 for the Fourth District Branch, in Glens Falls

Matters Referred from the House of Delegates

Resolutions regarding the Liaison Committee with the Veterans Administration were referred to the Council for rewording

It was voted that the rewording be left to Dr Anderton and Dr Bauckus with power

It was voted that the President be empowered to appoint the Board of Directors of the Veterans Medical Service Plan of New York, Inc , to be members of the special committee to represent the State Society as called for in the foregoing resolution

Preparedness Defense Committee —Dr Simpson brought up the matter of the appointment of the Committee on Preparedness Defense, as ordered by the House

It was voted that the President be empowered to appoint this Committee

War Memorial —*It was voted* that the Secretary be instructed to prepare the proper billheads and that these be sent to the county societies, and, that on the back of each bill should be printed "that the special assessment be due and payable now", also that a letter explaining the War Memorial be distributed with the bills to each member

It was voted that a letter be sent to each County Society Secretary with an explanation

Headquarters Room for A M A Delegates

It was voted that the Council request the Board of Trustees to appropriate $200 to pay for a meeting room for the use of our Delegates at the forthcoming A M A Convention

Appointment of Committee

The President appointed the Committee on Public Health and Education and its various subcommittees A complete list of committee appointments will appear in the next Minutes

CORRESPONDENCE

Clarifying the Mental Hygiene Issue

(A reply of the New York State Department of Mental Hygiene to a report of the Committee on Public Health Relations of the New York Academy of Medicine)

To the Editor

The NEW YORK STATE JOURNAL OF MEDICINE is to be congratulated for its sense of fair play and for the interest it displays in public and professional enlightenment by granting this space to the New York State Department of Mental Hygiene. Were there no correction of the misunderstanding which surely must have been generated by the report appearing on pages 529–534 of the JOURNAL'S March 1 issue, serious harm might be done the cause of the mentally ill of this state. Poorly substantiated criticism, either directly or by innuendo does not serve to advance science or the general welfare, on the contrary, it raises obstacles to progress. The JOURNAL is therefore rendering a commendable service in the following facts to replace the assumptions and generalities of the earlier article.

The report in question, entitled *Some Aspects of the Problem of the New York State Mental Hospitals System*, was prepared by E. H. L. Corwin Ph.D., and Thelma Pierce with the Committee on Public Health Relations of the New York Academy of Medicine, a reputable medical body dedicated to the development and dissemination of scientific (and by that token objective and unbiased) knowledge. Describing its report as a 'survey' of the State hospital system, the Committee states that it "supplemented its 'experience and observation with 'information secured from the Commissioner of Mental Hygiene of the State of New York, representative State hospital directors, and other sources, and that it combined these data with those obtained from the comprehensive literature on the subject.

The reader deserves to be informed that the above-quoted claims of the Committee constitute a gross misplacement of emphasis. It is an unhappy fact that practically everything in its report has already appeared elsewhere in print. The heavy hands of crusading feature writers lie upon some of it; the laments of producers of letters-to-the-editor are there; the findings of a national psychiatric body are presented and many of the suggestions are frankly based upon the recommendations of a legislative committee which completed its work four years ago, and whose observations are no longer valid or applicable. It would be interesting to learn just what in the report stems directly from the Committee's experience and observation.

As the present communication proposes to show, the report is a strange mixture of both acceptable and impractical recommendations, fact and hearsay, proposals of measures which have either long been in force or were put into practice within the past few years, and reckless new demands upon the public revenue.

Budget. At least one prejudicial and erroneous remark of the Committee must be corrected emphatically. Those responsible for the administration of New York's mental hospitals constantly appeal to the legislature for additional funds with which to do a proper job often without avail. Nothing could be farther from the truth. Back in 1942 and 1943 the Department of Mental Hygiene received an appropriation of only forty million dollars, the figure set for 1948–1949 is one hundred and seven million! Even taking into account the rise in prices during this period in the face of such increased allowances it is scarcely just to regard the State as being parsimonious toward its mentally ill.

Personnel. In neglecting to point out that shortage of personnel is a serious problem today among all kinds of hospitals—proprietary, voluntary and governmental—throughout the country, by implication the report leaves the reader with the false inference that understaffing is a characteristic peculiar to State mental hospitals. Furthermore the Committee was apparently not aware that on this score New York's State mental hospitals have been regaining during the past two years, the ground lost in the late war. On February 29 of this year nearly all the ward positions in these institutions were filled and there was virtually no problem in obtaining ward personnel except in some geographic areas where the difficulty is an inherent one. Surely this steady improvement in the situation could not have been accomplished if the positions were as unattractive as they are painted in the report.

The fact of the matter is that the beginning hospital attendant in a New York State hospital is now paid $2,208 a year, whereas in 1942 the figure was $1,252. Six years ago the attendant with four years of service received $1,396; today an attendant with this service is paid $2 600. Along with this the State hospital attendant has the security of a civil service position, pension rights, a full month's vacation with pay and generous sick leave allowance. Salary is in cash, and if complete maintenance is furnished it does not cost the attendant over 20 per cent of his salary.

It is by no means true that 'maintenance constitutes a major portion of their (the attendants') remuneration.' Only a few attendants are required to live on the hospital grounds (a minimum standby staff consistent with safe operation of the institution) and many of them even prefer to do so. For the employe who lives in, free hospitalization is accessible, and food and lodging are furnished at a modest cost. The current salaries, mentioned above are straight salaries the only deductions being for income tax and pension fund—and the latter is virtually a bank deposit, since the employe may borrow against it, and he takes his whole contribution with him if he leaves the service before he is eligible for pension.

We agree heartily that the well-trained attendant contributes to the adjustment of patients. For years the State hospitals have been training their attendants during a nine-month probationary period. Such training is now being expanded to a system-wide standardized course of 80 hours in all phases of ward management and care of patients.

The Committee does not distinguish itself when it draws heavily upon hearsay. Where else could it possibly have gathered the impression that his (the patient's) name is frequently unknown even to the nurse on his ward! This would be true only in the case of a nurse or attendant who had

been newly assigned to a ward, since these hospitals require that ward service personnel be thoroughly acquainted with all the patients in their care so that physical needs and changes in behavior can be called to the attention of the attending psychiatrist The Department is convinced by its own observation that this standard is upheld. In attacking the conscientiousness of the attendants the Committee is being decidedly unfair to a large body of workers who not only exhibit a deep sympathy for their charges but go out of their way to make extra efforts for their happiness and comfort

And what of the medical personnel? At the very bottom of the scale, the resident psychiatrist is paid a starting salary of $3,650, with an increase to $4,150 in his second year And at the time he is receiving this income he is given without charge an organized graduate resident training course in psychiatry (downstate at the State's Psychiatric Institute which enjoys the cooperation of instructors from the College of Physicians and Surgeons of Columbia University, upstate at Syracuse Psychopathic Hospital, Syracuse University Medical College) The Department of Mental Hygiene is willing to compare its program for recruiting and training psychiatrists with that of any other state

Shock Therapies Experience with shock therapies is being reported systematically, and statistics are being collected by the Department's institutions Shortly following Sakel's introduction of insulin shock therapy into the country, this and other convulsive therapies were introduced to the New York State hospitals, and their use at these institutions has been widespread since that time A considerable portion of the medical literature in these disciplines has emanated from the staffs of New York State's mental institutions When a recognized hospital journal recently published an article on shock therapy, it made use of the statistics of Ross and Malzberg, of this Department The figures were for 1939, so it is quite evident that New York's State hospital system has long kept statistics on these disciplines The statistics of this Department on shock therapy results are widely quoted

Alcoholics The Committee states, "For the most part, alcoholic patients admitted to mental hospitals are suffering from acute episodes and do not need the type of care which the State mental institution is planned and equipped to render" It should be borne in mind that the mental hygiene law forbids the institutions of this Department to accept inebriates who are not mentally ill While the impression may prevail that alcoholics accepted in the State hospitals do not show as vivid pictures of psychotic makeup as do patients in some other diagnostic categories, they are nevertheless psychiatric problems It is of course possible that some patients may on admission be in an acute phase of alcoholism, but this is usually one in a long-standing history of such episodes, and when the acute phase clears, residuals of organic damage and of personality disorder are observed Many such patients may show a higher level of adjustment to the controlled environment of the mental hospital None are kept, however, who can cope with the more complicated problems on the outside Relapse, which occurs frequently within a short time, may cause readmission, but such patients are not kept by the institute if the community can absorb them

Nurse Training On the last page of the report it is stated "Affiliation should be arranged with general hospitals to provide psychiatric training for all student nurses" Nothing else that the Committee has said is stronger proof of its lack of acquaintance with past and present conditions Not only has such an affiliation arrangement prevailed for years, but at this time, of the 104 schools of nursing in general hospitals in the State, 82 send their students to State hospital schools for training and experience in psychiatric nursing A recent study shows that over 95 per cent of nurses educated in New York State receive experience in psychiatric nursing, and New York's State-operated mental hospitals provide the lion's share of this training

Family Care The Department of Mental Hygiene is glad that the Committee brought up the matter of family care, because the opportunity is thus provided to clarify the somewhat common misunderstanding of this program—a misunderstanding which evidently is shared by the Committee In the report it is suggested that the State's family-care program for the mentally ill be "re-evaluated," but it develops that all the Committee has in mind is an increase in family-care allowances Family care is primarily therapeutic in purpose, although it does serve incidentally to release a few beds in the hospitals For a certain type of patient, usually along in years, family care offers a chance to make a limited social adjustment in uncomplicated surroundings, for certain patients with a good prognosis the family-care home furnishes a sort of transitional socializing experience following improvement under hospital care and treatment

Foster homes are not selected as one would choose a boarding house, the families must have the disposition, intelligence, and enthusiasm for doing a service for their fellow man, and they must be willing to perform this service altruistically, not on a commerical basis No, the family-care program will not serve its purpose on the basis suggested by the Committee

Reimbursement The complaint about reimbursement practices apparently refers to conditions which may have prevailed prior to 1943 It cannot be supported today Regular periodic investigations as well as special reinvestigations are made of the financial ability of relatives to pay, and the salaries which are reported on financial statements are verified (We do not believe that it would be practical or even advisable to require notarization of these statements) Rates are being continually increased, decreased, or canceled in line with any substantial change in ability to pay That more efficient collection methods are being used is obvious when one notes that total collections have steadily increased, even in the face of the rising cost of living and of the loss of overtime employment which existed during the war years The numbers of contributing relations have more than doubled in the last three years

It can be stated definitely that no discrimination is ever shown between reimbursing and nonreimbursing patients No patient was ever discharged from a New York State hospital because of failure to reimburse either in whole or in part Conversely, no patient has been retained at an institution longer than necessary merely because of financial ability or willingness to pay the full reimbursement rate Has the Committee considered the seriousness of its charge?

Clinics and Follow-up There is no denying that a need exists for a greater number of adult mental hygiene clinics, and the Department of Mental Hygiene would be among the first to welcome a rapid growth of such services The Department's in-

stitutions conduct 70 mental hygiene clinics and locally developed facilities of this kind would round out the program Besides, in the preventive sphere the State hospitals and State schools and the Department s division of prevention provide 109 regularly scheduled child guidance clinics plus a large number held on request the case load at the regular clinics alone in 1946 and 1947 was 5,973 These community-centered operations, however vital are of necessity a secondary consideration because of the pressing need for aftercare of patients from the State s mental institutions and the great shortage of psychiatrists social workers and other personnel

This brings up another amazing remark on page 532 of the report in question Psychiatric clinics would serve another purpose. They would make possible the discharge from mental hospitals of many of those patients who remain in the institutions solely for supportive treatment Where has the Committee been for the past two or three decades? The first "parole clinic of this Department was established in 1911 at Manhattan State Hospital. In the years that followed, the practice grew rapidly so that clinics for patients in convalescent care (not to mention the facilities which pave the way for patients being considered for convalescent care) have long been integral units in the hospitals programs

A strong implication is made in the report that large numbers of patients ready to go home are ignored and as a consequence must languish in the State hospitals. This is a monstrous accusation We hasten to assure readers of the JOURNAL that every patient who might conceivably make an adjustment outside the hospital is given a trial in the community During 1946 and 1947 18,853 patients were on convalescent status in the same period 6,053 such patients were discharged from the books of the hospitals, 4 652 had to be returned (of whom many would undoubtedly be given later trials) and a considerable number were still in convalescent care at the conclusion of their one-year period of convalescence. The Committee suggests that the clinics could serve the domestic relations and juvenile courts boards of health and education, visiting nurse organizations, and welfare agencies They already do such contacts are everyday experiences, although admittedly they could be extended.

The Hospitals and the Communities The whole matter of community relations with State mental hospitals is poorly understood by the Committee. Many staff members hold teaching positions in the nearby universities and medical schools week after week through the year groups of medical students and social science classes are visiting the institutions, where they are taken on tours of inspection and attend lectures and clinical demonstrations, medical societies in some areas hold meetings at the State hospitals and some of our staff members are officers of the societies veterans groups pay regular calls to cooperate in entertainments for ex-service patients. But why go on? It is a fact that the more remote a State hospital is, the more anxious it is to participate in the life of the surrounding community

Location of Hospitals The State mental hospitals are located more or less centrally in the districts which they serve. Of course the New York metropolitan area is an exception since many patients who are residents of the city have to be cared for in several Long Island institutions The remoteness of these hospitals is merely a reflection of public opinion which influenced State policy at the time these hospitals were built. But will the citizens of New York State support the purchase of the high priced real estate which would be needed to house and treat these mental patients in spots accessible to the city s medical center and abandon the existing ones? It is hardly likely Academicians can deal blithely with budgetary matters but they should realize that when it comes to a State public service, it is the taxpayer who must be convinced Would the Committee be willing to answer to the public for the scrapping of a State-wide system of building plants which was bought at great cost over the years?

Overcrowding and Plans for Future Ever since New York's first State mental institution was opened 105 years ago overcrowding has been a bugbear That is why this Department s program of reconstruction includes plans for enlargement and modernization to the tune of more than a hundred million dollars To date the legislature has appropriated over sixty millions of New York State s Postwar Reconstruction Fund

In conclusion the Department of Mental Hygiene wishes to make clear that it is well aware of its problems and has no desire to resist honest intelligent, constructive criticism It has no doubt that the Committee had the best of intentions and will welcome this clarification of the issue.

FREDERICK MACCURDY, M D
Commissioner of Mental Hygiene

May 25 1948

To the Editor

'Blessed are the meek if only because no suspicion attaches to them unlike the lady who doth protest too much

Under the lash of aroused public opinion following the Moreland investigation the State Department of Mental Hygiene woke up from its deep slumber and wrought improvements which make a creditable showing

The almost hysterical reaction to the statements and the numerous recommendations in the report of the Committee on Public Health Relations of the New York Academy of Medicine suggests an attitude of smugness on the part of the Commissioner and his immediate staff and a disposition to cavil over minor points. Our report was prepared on the basis of statements and figures given to us by the Commissioner himself as well as a number of men associated with the Department, and the notes taken at our conferences were submitted to the Commissioner for verification The purported minor inaccuracies either of figures or of statements

REVIEWED

Synopsis of Allergy By Harry L. Alexander M D Second edition Duodecimo of 255 pages illustrated. St. Louis C V Mosby Co., 1947 Cloth, $3 50

This is a brief practical handbook on allergy for students and practitioners by an expert who has made significant contributions to the field. It is sound and reliable and is recommended

ANDREW BABEY

Diseases Transmitted from Animals to Man. By Thomas G Hull Ph D Third edition Octavo of 571 pages, illustrated. Springfield Ill Charles C Thomas 1947 Cloth $10 50

This third edition is an excellent compilation and description of many diseases. It is timely being enhanced by the inclusion of many new chapters The book is well illustrated by many figures and tables and includes numerous valuable references to the literature Together with the additional material and the revision of previous editions it maintains the standards which it has established. It is most valuable for workers in medical and animal bacteriology with special reference to the transmission of micro-organisms from animal to man

MAX LEDERER

Peace of Mind. By Joshua Loth Liebman Octavo of 203 pages. New York, Simon & Schuster 1946 Cloth, $2.50

This book is a sympathetic, well-written popular presentation of the psychoanalytic concept of personality By avoiding technical jargon and the more bizarre examples of personality disorders so often used to spice popular discussions of personality problems the author has made modern concepts palatable and helpful to many people whose traditional beliefs had previously kept them from receiving any benefit from psychotherapy

Perhaps the only weakness in the book is its rather superficial treatment of basic philosophic and theologic problems This may however prove an advantage rather than a disadvantage in a popular work.

ARTHUR SHAPIRO

Standard Methods of the Division of Laboratories and Research of the New York State Department of Health. By Augustus B Wadsworth M.D Third edition. Octavo of 990 pages illustrated Baltimore Williams & Wilkins Co 1947 Cloth, $10

For many years Wadsworth's *Standard Methods* has been a necessary work in every laboratory of bacteriology and public health. This new and greatly enlarged edition maintains the high standards of its predecessors. Specific and complete details are given for every diagnostic test and for every bacteriologic and serologic procedure as well as for the preparation of vaccines toxins antitoxins and other diagnostic and therapeutic sera. The chapter on the serodiagnosis of syphilis has been completely revised

ARNOLD H EGGERTH

Arthritis and Related Conditions. Edited by Theodore Franklin Bach M.D Octavo of 472 pages illustrated Philadelphia F A Davis Co 1947 Cloth $6 50

This is a useful review of the main points on arthritis with fairly detailed consideration of therapy One specially good chapter concerns the use of procaine in various rheumatic conditions. There is a complete section on the use of x rays for therapy This book makes interesting useful reading and is worthy of study

ANDREW BABEY

Curare Its History Nature, and Clinical Use. By A R. McIntyre M D Octavo of 240 pages illustrated Chicago University of Chicago Press 1947 Cloth, $5 00

This timely monograph was prompted by the ever widening field in the recent use of curare as a supplement to inhalational anesthetics The chapter on the clinical use of curare well illustrates its dual basis chief of which is the well-recognized peripheral or classical action and the second of which, especially with prolonged curarization or heavy initial doses is central depression of the nervous system

Physicians who include anesthesia in office practice as well as those who specialize in its administration will benefit by the information this work offers.

S INGRAM HYRKIN

Penicillin Therapy Including Streptomycin Tyrothricin, and Other Antibiotic Therapy By John A. Kolmer Second edition Octavo of 339 pages, illustrated New York, D Appleton-Century Company 1947 Cloth $6 00

In the second edition of this review of antibiotic therapy Dr Kolmer has revised and brought up to date his chapters on streptomycin tyrothricin and streptothricin The most recent literature has been gone into regarding the larger doses of penicillin which predispose to intravascular thrombosis as a result of which heparin is suggested as an adjunct to penicillin therapy The references are most complete and the entire presentation of the book is lucid accurate, and covers fully the subject of antibiotics and their clinical applications

LEO LOEWE

Diagnostic Bacteriology A Textbook for the Isolation and Identification of Pathogenic Bacteria for Medical Bacteriology Laboratories. By Isabelle Gilbert Schaub A B and M Kathleen Foley, A B Third edition. Octavo of 532 pages St. Louis C V Mosby Co 1947 Cloth $4 50

This the third edition of *Diagnostic Bacteriology* by Schaub and Foley has been considerably enlarged in scope and content It is a mine of information of a practical nature for the identification of the bacteria commonly prevalent in medical practice. The authors have tried to incorporate the tricks of the trade to simplify the problem of diagnostic bacteriology In this attempt they have succeeded admirably As a reference it should prove invaluable to the bacteriologist and his technologists.

MAX LEDERER

Color Atlas of Hematology With Brief Clinical Descriptions of Various Diseases. By Roy R Kracke M.D Octavo of 204 pages illustrated Philadelphia J B Lippincott Company 1947 Cloth $5 00.

This is a fine brief textbook on diseases of the

blood Together with short summaries of diseases, excellent color plates are shown to illustrate cell types There is a fine chapter on bone marrow, also an admirable section on technic, together with a summary of the findings of the many diseases in which a knowledge of blood changes may be helpful This book is warmly recommended to students and physicians also

ANDREW BABEY

Food and Health By Henry C Sherman, Sc D New Edition Octavo of 290 pages New York, Macmillan Company, 1947 Cloth, $4 00

This is a new edition, the original of which appeared in 1934 Much of the valuable empirical knowledge of foods has since been proved experimentally The author brings this knowledge up to date He stresses the importance of natural foods containing all nutrient elements as against refined impoverished foods This book, though written for the layman, is recommended to all interested in nutrition

MORRIS ANT

Gynecology With a Section on Female Urology By Lawrence R Wharton, M D Second edition Octavo of 1,027 pages, illustrated Philadelphia, W B Saunders Company, 1947 Cloth, $10

In this edition the author has revised his text to include the advances made in gynecology The sections on embryology and congenital malformations have been almost completely rewritten As in the first edition female urology is presented in detail, and in this section are new chapters on the female urethra and water cystoscopy The revisions have considerably increased the value of the text and it is highly recommended to the profession

ALEXANDER H ROSENTHAL

Fundamentals of Clinical Neurology By H Houston Merritt, M D , Fred A Mettler, M D , and Tracy Jackson Putnam, M D Octavo of 289 pages, illustrated Philadelphia, Blakiston Company, 1947 Cloth, $6 00

This well-written handbook by three prominent authors contains a wealth of information, including neuroanatomy, neurophysiology, and clinical neurology The reviewer recommends this book for every clinician as a valuable reference volume

A M RABINER

Dermatologic Clues to Internal Disease By Howard T Behrman, M D Octavo of 165 pages, illustrated New York, Grune & Stratton, 1947 Cloth, $5 00

This book of 161 pages is an attempt to correlate many dermatoses with visceral dysfunction The author discusses over 150 conditions, dermatologic or otherwise, arranged alphabetically It is written entirely too concisely for the nondermatologist to grasp Some of his statements are not up to date He places contact dermatitis and the tuberculin type of hypersensitiveness as manifestations in hypersensitive individuals, such as asthmatics They occur just as frequently in nonatopics In many of the conditions mentioned no internal connection is shown by the author

The whole subject matter can be grouped under four headings (1) Dermatoses with no known internal connections as scleroderma and pemphigus (2) Dermatoses associated with similar internal involvements as Kaposi's sarcoma, Recklinghausen's disease, sarcoidosis (3) Internal conditions occasionally showing skin manifestations as leukemia, Hodgkin's disease, and colitis (4) Dermatoses due to internal diseases as endocrine disturbances, avitaminosis, and xanthoma In general it can be stated that the book only partially (the last two groups) gives "dermatologic clues to internal diseases"

ABRAHAM WALZER

Atlas of Cardiovascular Diseases Correlation of Clinical Electrocardiography and Cardiac Roentgenology with Clinical History and Autopsy Findings By Irving J Treiger, M D Quarto of 180 pages, illustrated St Louis, C V Mosby Co , 1947 $10

This *Atlas* is especially valuable for the fine x-ray pictures, necropsy specimens, and electrocardiograms which accompany each case It contains a good deal of information which will prove very helpful for students and practitioners

ANDREW BABEY

Urology in General Practice By Nelse F Ockerblad, M D Second edition Octavo of 392 pages, illustrated Chicago, Year Book Publishers, 1947 Cloth, $5 75

This, the second and up-to-date edition, contains nearly four hundred pages of valuable clinical material both in diagnosis and treatment The work is clear, concise, comprehensive, and well illustrated, and represents a valuable contribution by an outstanding urologist The book, while intended for the general physician, can be well used by medical students and by residents-in-training for the specialty

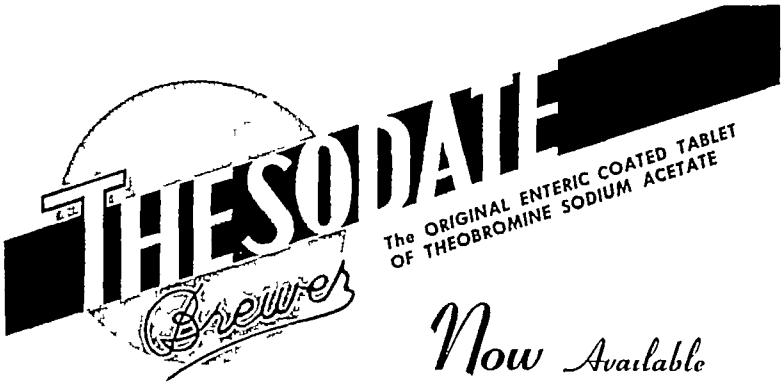
AUGUSTUS HARRIS

Mental Mischief and Emotional Conflicts Psychiatry and Psychology in Plain English By William S Sadler, M D Octavo of 396 pages St Louis, C V Mosby Company, 1947 Cloth, $6 00

The nervous patient almost invariably suffers rather than profits from reading literature concerning the mechanisms of the mind However, for the normal lay reader this excellent book written by a psychiatrist with forty years of experience offers a wealth of information

LAURENT FEINIER

Rehabilitation Through Better Nutrition University of Cincinnati Studies in Nutrition at the Hillman Hospital, Birmingham, Alabama By Tom D Spies, M D Octavo of 94 pages, illustrated Philadelphia, W B Saunders Company, 1947



This small volume describes proved vitamin deficiencies and the anemias The physician is given pointers in diagnosis and treatment The contents are the result of many years of observation and are a practical application of present-day knowledge The book is recommended for every practicing physician

M ANT

Gastritis By Rudolf Schindler, M D Octavo of 462 pages, illustrated New York, Grune & Stratton, 1947 Cloth, $10

The author, a pathologist and pioneer gastroscopist, attempts to present in his monograph the

[Continued from page 1638]

subject of gastritis from the pathologic, gastroscopic, and clinical points of view He thoroughly covers the literature on the subject and expresses his own opinion backed by case presentations and pathologic demonstration wherever possible

Dr Schindler, with his vast experience in gastroscopy, fills the gap where gross pathology fails The book should be part of the internist's, as well as of the pathologist's, medical library

JAMES TESLER

Bone and Bones Fundamentals of Bone Biology By Joseph P Weinmann, M D , and Harry Sicher, M D Octavo of 464 pages, illustrated St Louis, C V Mosby Company, 1947 Cloth, $10

This book is obviously a labor of love by an anatomist and pathologist, teaching in the College of Dentistry of the University of Illinois It is superbly illustrated, and has an extensive bibliography Fundamentals of bone growth and disease are stressed, radiographs are rare while histologic illustrations are abundant One important omission is "march fracture," so common in military life and an exception to the author's statement that "fractures of bones are caused by trauma of short duration" Nor is the osteoporosis of the senile and that of women after the menopause thoroughly discussed, but adequate references are supplied in this field For the pathologist and internist, as well as for the dentist, this book serves its purpose well

WILLIAM DOCK

The Medical Clinics of North America Nationwide number March, 1947 Octavo Philadelphia, W B Saunders Company, 1947 Published Bimonthly (six numbers a year) Cloth, $16, net, Paper, $12 net

The March number of the *Medical Clinics of North America* is a nationwide survey of diabetes Most of the articles are from New England, several are from Philadelphia and the Mayo Clinic There are brief references to juvenile diabetes, insulin mixtures, the glucose tolerance test, pregnancy and diabetes, and management of coma As usual, the *Clinics* are worth reading with care

ANDREW BABEY

Essentials of Endocrinology By Arthur Grollman, M D Second edition Octavo of 644 pages, illustrated Philadelphia, J B Lippincott Company, 1947 Cloth, $10

Here is a thoroughly literate and scientific chart of the vast "sea of endocrinology" A bewildering literature on this subject has grown rapidly in recent years, replete with assumptions, vocabulary and many, many pieces of data Out of all these emerges Dr Grollman's cool appraisal—a lucid, fascinating, accurate, and documented text

The interrelationships among the glands of internal secretion are drawn as honestly as present facts allow The charts and illustrations are clear and to the point The clinical scientist will appreciate the rational and specific therapies that are advised The research scientist will find ready reference to the basic physiologic and pathologic facts

MAURICE TULIN

Recent Advances in Clinical Pathology By Various Authors Produced under the Auspices of the European Association of Clinical Pathologists General Editor, S C Dyke, D M (Oxon) Duodecimo of 468 pages, illustrated Philadelphia, Blakiston Company, 1947 Cloth, $5 50

This is an excellent number of the *Recent Advances* series published from time to time in England It reflects the practice of the best clinical pathologists in that country Section I covers bacteriology, and Section II biochemistry There are two other parts on hematology and histology

The book covers well a big field It is clearly written, to the point, and avoids the annoying practice so common in many books of quoting innumerable references

ANDREW BABEY

The 1946 Year Book of Neurology, Psychiatry, and Neurosurgery Neurology edited by Hans H Reese, M D , and Mabel G Masten, M D Psychiatry edited by Nolan D C Lewis, M D Neurosurgery edited by Percival Bailey, M D Duodecimo of 732 pages, illustrated Chicago, Year Book Publishers, 1947 Cloth, $3 75

This is by far the best of all the year books published of this series Endocrinology no longer is included as a special division and has been replaced by neurosurgery The papers abstracted are thoroughly evaluated and the material is so rich that any attempt to emphasize specially any of the reports would require space not available for this review This is a book that should be on the shelves of every practicing physician of every specialty and would be a valuable source of information for the general practitioner

A M RABINER

The Medical Clinics of North America. New York Number May, 1947 Octavo Philadelphia, W B Saunders Company, 1947 Published Bimonthly (six numbers a year) Cloth, $16 net, Paper, $12 net

This issue contains an instructive compilation of material for the pediatrician as well as for the general practitioner The reviewer was impressed especially with the following articles "Meningococcemia", by Bakwin and Lecks, "The Employment of Gamma Globulin in Pediatrics", by Morris Greenberg, "The Management of Syphilis in Children", by Yampolsky, and "Feeding Difficulties", by Ruth Bakwin

The entire collection deserves careful reading, the subject matter is of a practical nature and is handled by men of experience who tell their respective stories in a direct way and to the point

HARRY APFEL

Rh Its Relation to Congenital Hemolytic Disease and to Intragroup Transfusion Reactions By Edith L Potter, M D Octavo of 344 pages, illustrated Chicago, Year Book Publishers, 1947 Cloth, $5 50

This book is devoted to a comprehensive study of the Rh factor and its relation to congenital hemolytic disease and to intragroup transfusion reactions The author is to be complimented on the full and discriminating collection of the loose ends of so vast a subject within the limits of this short treatise and at a time when the field is so beclouded with confusion There appears a tendency to over-dogmatism, in view of the lack of complete knowledge It will take a few years before all the data can be pieced together to form a clearer picture of the subject, presented in such scholarly fashion by the author

MAURICE MORRISON

do not in our judgment detract from the main thesis, neither do they invalidate the conclusions

The report is indicative of the keen interest which the Committee on Public Health Relations has taken in the problems facing the Department of Mental Hygiene and of the thought given to them The soundness of the Committee's statements and recommendations is attested to by the Secretary of the Board of Visitors of one of the State mental hospitals, who has informed us that the report was read at a meeting of the Board whose members "were all tremendously interested" He requested that copies of it be made available to the Executive Board of the Association of Members of Boards of Visitors

The Long and Short of digitalis therapy!

With Digitaline Nativelle, cardiotonic influence usually becomes apparent within *three* hours. Full digitalization can be accomplished as rapidly as *six hours —instead of in days!*

Only such effectiveness brings the patient the desired, *quick relief* of air hunger and discomfort—and with virtual freedom from side effects. The physician will welcome the ease of administration as well as the considerably greater accuracy in therapy.

Simplicity of administration

RAPID DIGITALIZATION 1.2 mg. in equally divided doses of 0.6 mg. at three hour intervals

MAINTENANCE 0.1 or 0.2 mg. daily depending upon patient's response

CHANGE OVER 0.1 or 0.2 mg. of Digitaline Nativelle may advantageously replace present maintenance dosage of 0.1 gm. or 0.2 gm. of whole leaf

Current references and comprehensive brochure "Management of the Failing Heart" available on request. Also, if you wish, we will send a full digitalizing dose. Simply address Research Division, Varick Pharmacal Company, 75 Varick Street, New York 13, N. Y.

Digitaline Nativelle

active glycoside of digitalis purpurea (*digitoxin*)

For a lady in distress

'Dexedrine' Sulfate relieves much of the distress of the menopause .. by reawakening the patient's optimism and mental alertness . by restoring her feeling of energy and well-being by reviving her interest in life and living

Unlike d-desoxyephedrine, 'Dexedrine' produces a uniquely "smooth" anti-depressant effect It can be depended upon to improve the mood and brighten the outlook without giving the patient the uncomfortable feeling of "drug stimulation".

Experience is the Best Teacher

Richard Bright *(1789-1858) proved it in anatomy*

Richard Bright a renowned physician of his time, made many fundamental contributions to medical science. Besides his many brilliant anatomical observations, he was among the first to describe acute yellow atrophy of the liver and to point out that dropsy with albuminuria was the result of kidney disease. Bright's detailed studies still are important additions to the collected experience of medicine.

R. J. Reynolds Tobacco Co. Winston-Salem N. C.

Experience is the best teacher in cigarettes, too!

YES! Experience counts in medicine—and in choosing a cigarette too. Thousands and thousands of smokers who have tried and compared many different brands of cigarettes have learned from experience that Camels suit them to a "T". Result? More people are smoking Camels than ever before.

Try Camels! Discover for yourself how the rich full flavor of Camel's choice properly aged and expertly blended tobaccos pleases your taste. See if Camel's cool cool mildness isn't mighty welcome to your throat.

See for yourself why, with millions of smokers, Camels are the "Choice of Experience."

According to a Nationwide survey:

More Doctors Smoke CAMELS

than any other cigarette

Three independent research organizations in a nationwide survey asked 113,597 doctors what cigarette they smoked. The brand named most was Camel!

SMOOTH APPROACH

In golf, it's not the erratic hard hitters who are tough to beat but the chap who keeps coming up with a consistent smooth approach time after time

That's why Zymenol is a consistent winner—a smooth approach to effective bowel management without erratic drugs or irritants Zymenol (1) influences restoration of an aciduric condition favorable to beneficial intestinal bacteria (2) normalizes bowel motility In a teaspoon dose Which is an advantage

Zymenol

DUODENAL-GASTRIC ULCER

Treatment Antacid Rx —CA-MA-SIL Powder, in ½ glass water (preferably hot)
2 tspfls *before* and after meals and upon retiring

Clinical observations of the merits of CA-MA-SIL Antacid Powder are convincing in the treatment of excess gastric hyperacidity associated with DUODENAL and GASTRIC ULCER. Successful management with CA-MA-SIL assures the patient of 3 nearly normal meals, prompt relief and aids rapid healing The longer neutralizing period makes it especially effective in Duodenal Ulcer Therapy *

PRESCRIBED BY PHYSICIANS EVERYWHERE

CA-MA-SIL COMPANY, 700 Cathedral Street, Baltimore 1, Md

* ALSO UNEXCELLED FOR NAUSEA OF PREGNANCY
* DOES NOT INDUCE ANOREXIA—CONTAINS NO SODA OR ALUMINUM HYDROXIDE

Formula New Magnesium Silicate Special (not trisilicate) Calcium Carbonate Diammonium Hydrogen Phosphate
Samples Available

HAY FEVER *relief* day and night...

The extra long action of Neo-Synephrine hydrochloride makes possible control of hay fever symptoms with infrequent dosage thus enabling the patient to be comfortable during the day and obtain sleep at night

Average dose: 2 or 3 drops in each nostril

No appreciable interference with ciliary action. Virtually no side reactions.

FOR NASAL USE: ¼% solution (plain and aromatic) 1 oz. bottles; 1% solution, 1 oz. bottles; ½% water soluble jelly ½ oz. tubes.

FOR OPHTHALMIC USE: ¼% low surface tension, aqueous solution isotonic with tears, 15 cc. bottles.

Report of the Committee on Therapy of

THE AMERICAN ACADEMY OF ALLERGY

on HYDRYLLIN

The results of the study

		60% to 100% EFFECTIVE (Regarded as "Good")	40% to 60% EFFECTIVE (Regarded "Fair")	0% to 40% EFFECTIVE (Regarded as "Poor")
Hay Fever	790 CASES	304 (38%)	234 (30%)	252 (32%)
Asthma	397 CASES	119 (30%)	82 (21%)	196 (49%)
Pollen Asthma	226 CASES	73 (32%)	55 (24%)	98 (44%)
Vasomotor Rhinitis	130 CASES	20 (16%)	42 (32%)	68 (52%)
Urticaria	24 CASES	4 (17%)	8 (33%)	12 (50%)
Eczema	3 CASES			3
TOTAL	1570 CASES			

Side Reactions

No Reactions	1,219 Cases (72%)
Moderate Reactions	314 Cases (20%)
Severe Reactions	126 Cases (8%)

Conclusion From these figures it would seem that the preparation has a fair degree of effectiveness in hay fever and asthmatic cases, both those with asthma due to pollen and those having asthma from other sources, the figures of the effectiveness of the drug are more impressive than those of other antihistaminics.

ON THE basis of the study made by the Committee on Therapy of The American Academy of Allergy, HYDRYLLIN is an effective and well tolerated antihistaminic for use in the treatment of allergic manifestations.

HYDRYLLIN®

Each tablet contains: DIPHENHYDRAMINE (Searle) 25 mg. AMINOPHYLLIN (Searle) 100 mg.

Hydryllin is also available in elixir form. Each 4 cc. (1 teaspoonful) is equivalent to one-half tablet of the drug.

Children say

"it tastes good!"

Because it tastes so good, children actually like to take Eskadiazine Important, too, this *fluid* sulfadiazine relieves tired parents and busy nurses of the chore of crushing tablets and coaxing a sick child to swallow an unappealing mixture

Still another advantage is rapid absorption With Eskadiazine desired serum levels are attained in two hours, rather than the six hours required for sulfadiazine in tablet form

Eskadiazine

The outstandingly palatable fluid sulfadiazine

In treating Para-nasal Infection

Avoid RHINITIS MEDICAMENTOSA

℞ ARGYROL for decongestion without rebound

Rhinitis Medicamentosa—a result of repeated rebound congestion-is attributed solely to the use of vasoconstrictors

Use of ARGYROL accomplishes the main purpose of treatment—the restoration of normal nasal function—without danger of inducing this chronic condition

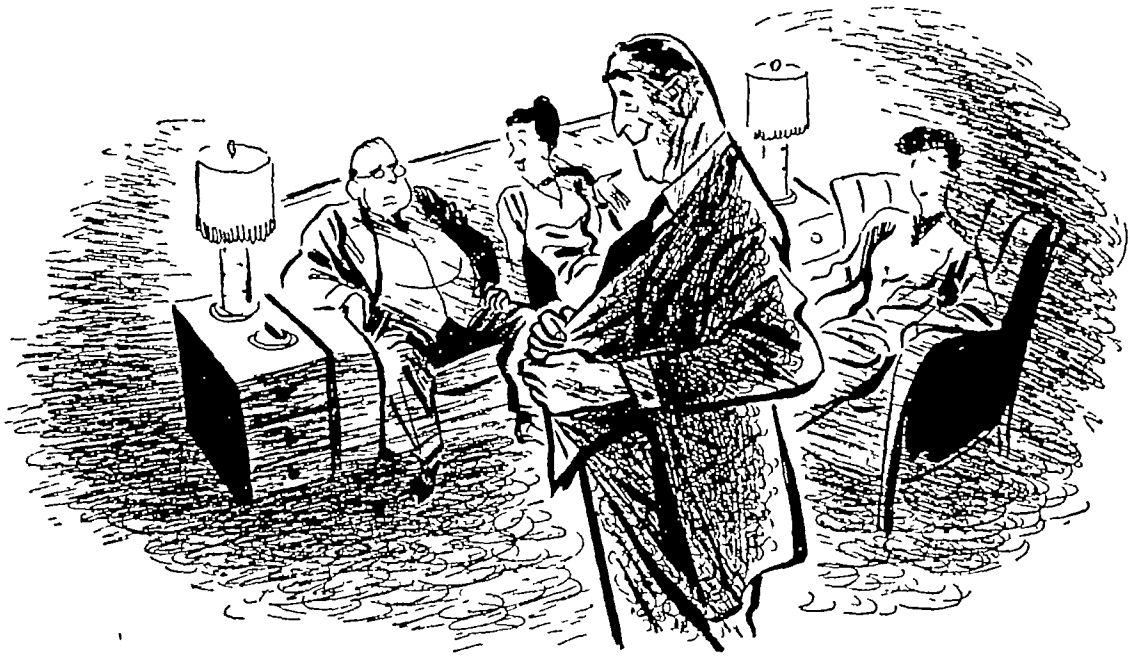
The ARGYROL Technique

1. The nasal meatus by 20 per cent ARGYROL instillations through the nasolacrimal duct.
2. The nasal passages with 10 per cent ARGYROL solution in drops
3. The nasal cavities with 10 per cent ARGYROL by nasal tamponage

Its Three Fold Effect

1. Decongests without irritation to the membrane and without ciliary injury
2. Definitely bacteriostatic yet non toxic to tissue
3. Cleanses and stimulates secretion thereby enhancing Nature's own first line of defense

ARGYROL *the*



Medication of Choice in treating Para-nasal Infection

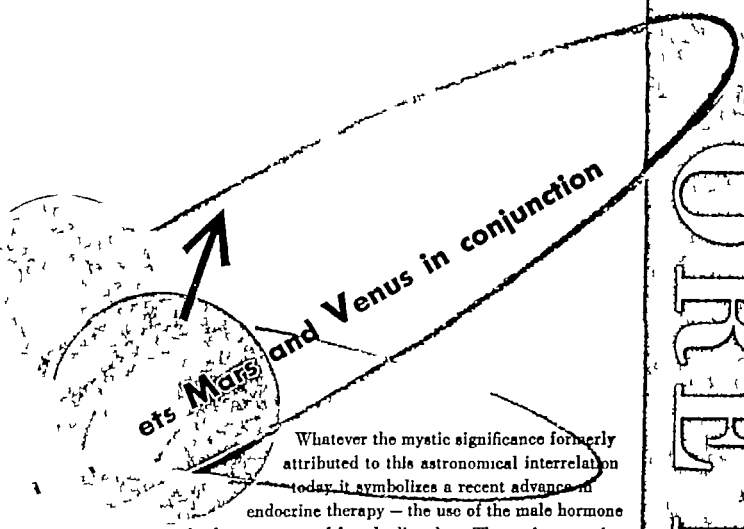
The ethical way to make him a GOOD LOSER

After the novelty of reducing wears off, the obese patient is all too apt to revert to his former eating habits To stay on the prescribed diet until new habits are established, he may need the help of an appetite depressant such as DESOXYN Hydrochloride Under medical supervision, DESOXYN is safe and dependable for this purpose DESOXYN further aids the therapeutic reducing program by increasing the sense of well being and desire for activity Small doses are adequate—a 2 5 mg tablet an hour before breakfast and lunch, possibly another in mid afternoon if it does not cause insomnia DESOXYN is also useful in a number of conditions requiring cerebral stimulation Clinical studies show its effectiveness in smaller doses, its faster onset and more prolonged action with fewer side effects in comparison with other sympathomimetic amines New literature on DESOXYN is now available through your Abbott representative, or write to ABBOTT LABORATORIES, NORTH CHICAGO, ILLINOIS



TABLETS:
2 5 mg and 5 mg

ELIXIR:
20 mg per fluidounce

AMPOULES:
20 mg per cc

Specify **Desoxyn**® Hydrochloride

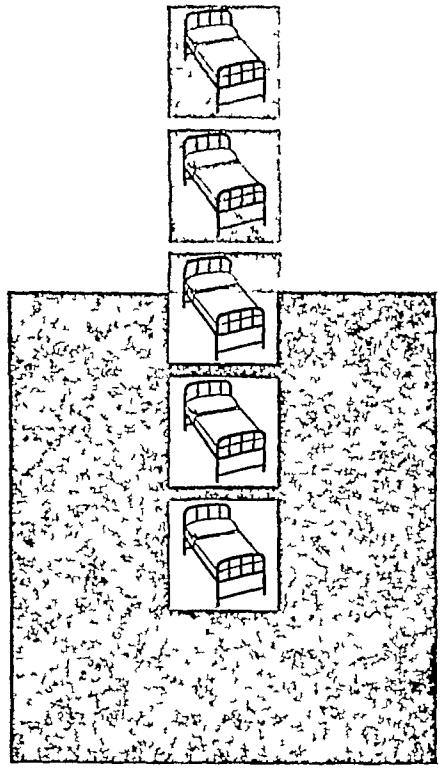
(d Desoxyephedrine Hydrochloride, Abbott)

Whatever the mystic significance formerly attributed to this astronomical interrelation today it symbolizes a recent advance in endocrine therapy — the use of the male hormone in the treatment of female disorders. The antiestrogenic action of the male hormone including its inhibiting effect on the uterine musculature facilitates control of gynecologic disturbances.

ORETON-M

METHYLTESTOSTERONE U.S.P XIII *tablets*

are effective — by mouth — in the management of dysmenorrhea and premenstrual distress functional uterine bleeding and the menopause In the puerperal patient ORETON M* relieves breast engorgement, abolishes after pains and inhibits lactation



DOSAGE: *Dysmenorrhea and premenstrual distress* — Three 10 mg tablets or one 25 mg. tablet daily for 10 days preceding menses. *Functional uterine bleeding* — Three 25 mg tablets every other day for 3 or 4 doses to control bleeding *Menopause* — One 10 mg tablet or more daily Breast engorgement — Three 10 mg tablets daily for 2 or 3 days while continuing nursing *After-pains* — Three 10 mg. tablets at end of labor repeating in 8 hours if necessary *Inhibition of lactation* — Three 25 mg tablets twice daily for 2 days beginning immediately postpartum.

ORETON M Tablets of 10 mg in boxes of 15, 30 and 100; or 25 mg in boxes of 15 and 100

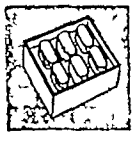
puerperal morbidity reduced

Pelvicins*

[penicillin vaginal suppositories Schenley]

In a recent controlled study [1] of 1,573 obstetrical patients, the incidence of genital tract infections was reduced from 5 3 per cent to 2 3 per cent. when penicillin vaginal suppositories were used *A decline of 56 6 per cent!*



ADDITIONAL ADVANTAGES PELVICINS (penicillin vaginal suppositories Schenley) shorten the hospitalization period, reduce nursing care required, are completely painless and nonirritating These advantages suggest the value of their routine use in obstetrical procedure

SIMPLICITY OF TECHNIQUE Insert 2 PELVICINS (total, 200,000 units of penicillin) into posterior fornix of vagina with a sponge forceps, immediately after delivery of the placenta

SUPPLIED Boxes of 6 and 12 PELVICINS, 100,000 units each

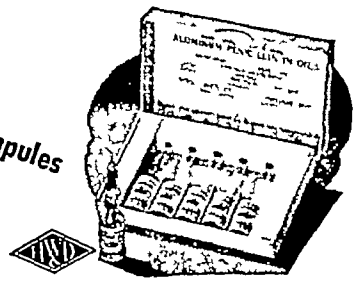
Aluminum

PENICILLIN.*

Aluminum Penicillin Oral Tablets provide for maximum utilization of the dose administered Low solubility of the aluminum salt renders it much less liable to inactivation in the stomach Destruction in the intestinal tract is inhibited by the addition of sodium benzoate



Aluminum Penicillin in Oil for intramuscular injection is a bland suspension of the new relatively insoluble aluminum salt of penicillin in peanut oil alone Fluid at body temperature, it has the outstanding advantages of not causing pain or sterile abscesses. Slow absorption is accomplished by the slight solubility of the drug itself

Aluminum Penicillin Oral Tablets 12 tablets, 50,000 units each

Aluminum Penicillin in Oil 1 cc size ampules, 300,000 units per cubic centimeter

* Patent applied for

FERROUS
GLYCINATE
-MRT
(an original MRT
contribution)

Ferrous Glycinate-MRT provides approximately 8% more available ferrous iron than ferrous sulfate in addition to glycine, found to be essential for the production of pyrrole rings which in turn form protoporphyrin, the precursor of hemoglobin [1]

Capsules Ferrous Glycinate-MRT contain ferrous glycinate suspended in an edible oil assuring passage through the stomach without reaction and subsequent gastric distress Positive absorption in the intestine.

Elixir Ferrous Glycinate-MRT is so free from astringency that it will not curdle milk Ideal as an admixture Especially recommended for children.

Each Capsule Ferrous Glycinate-MRT contains ferrous glycinate 100 mg (in oil) equivalent to 25 mg ferrous iron. Each teaspoonful (5 cc.) of Elixir Ferrous Glycinate-MRT contains 183 mg ferrous glycin te (corresponding to 50 mg of ferrous iron) and 10 grains of glycine.

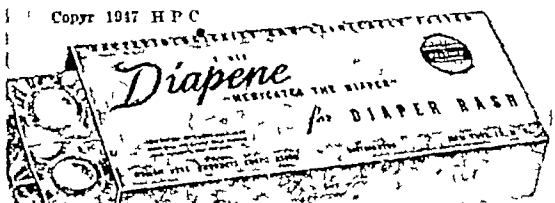
"MEDICATES THE DIAPER"



The cause of *ammonia dermatitis* is ammonia liberated by bacterial decomposition of urinary urea DIAPENE — impregnated into the laundered diaper merely by rinsing — checks the particular bacillus which releases ammonia from the baby's urine DIAPENE, therefore, prevents and relieves diaper rash **by eliminating the cause**

IMPORTANT —DIAPENE is as basically necessary as baby oil, powder or ointment, because chafing, prickly heat, allergy rashes, etc, are often aggravated by ammoniacal urine DIAPENE is a prophylactic MUST for every baby!

For prevention, medicate only "night" diapers
For treatment, medicate all the diapers
One tablet to 2 qts water, a rinse for 6 diapers

Bacteriologically and Clinically Tested for Doctor's Use —

Mr. Micawber was only half-right!

MR MICAWBER'S financial advice to young David Copperfield is justly famous

Translated into United States currency, it runs something like this

> *"Annual income, two thousand dollars, annual expenditure, nineteen hundred and ninety-nine dollars, result, happiness Annual income, two thousand dollars, annual expenditure, two thousand and one dollars, result, misery'*

But Mr Micawber was only half-right!

Simply *not* spending more than you make isn't enough Every family must have a cushion of savings to fall back on and to provide for their future security

U S Savings Bonds offer one of the best ways imaginable to build savings

Two convenient, automatic plans make the systematic purchase of Savings Bonds both sure and trouble-free

1. If you work for wages or salary, join Payroll Savings—the *only* installment-buying plan

2. If you're in business, or a farmer, or in a profession, and the Payroll Savings Plan is *not* available to you, then sign up at your bank for the Bond-A-Month Plan

Each helps you build a nest egg of absolutely safe, 100% government-backed U S Savings Bonds And these bonds make more money for you while you save For after only ten years, they pay you back $400 for every $300 you put in them

Join the Plan *you're* eligible for today! As Mr Micawber would say "Result, security!"

Draft Boards Again

With the passage of the first selective service legislation to operate in the United States in a time of putative world peace (the selective service bill of September 7, 1940, was signed by President Roosevelt September 16, 1940, after the war in Europe was well under way, Poland having been invaded September 1, 1939), the physicians of this country will once again be called upon to implement the mechanism of the draft [1] Inductions will commence September 22 of this year, a date which precedes the start of the academic year of virtually all colleges All men of the ages of eighteen to twenty-six must register, probably in the month of August

> Proposals to extend the draft for physicians and dentists to age forty-five were not passed Yet there are few doctors available younger than twenty-six, and the draft contains provision stating that no person shall be inducted 'until adequate provision" has been made for medical care and hospital accommodations "[1]

In this day and age of super speeds and elaboration of mechanisms of all kinds, the public is made aware of the perfection of things, devices, artifacts, structures These things can be photographed pictorialized, described Especially with respect to medicine, there exists the tendency to overemphasize the importance of drugs, apparatus, buildings, and machinery and to minimize the essential—the doctor, the *deus ex machina*, who must prescribe intelligently, interpret the product of the apparatus knowingly, for instance the x ray film, and make the machinery of the draft of any value.

Once again the doctors of the nation are to be called upon far in advance of the date inductions will start, to provide that expert knowledge and skilled medical service without which recruitment for the National

[1] New York Times, June 28 1948, p 6

Guard and the processing of selectees for the armed forces would be useless Technical personnel can take x-ray pictures, electrocardiograms, give enemas and hypodermic injections, make electroencephalograms, operate diathermy machines, and do laboratory procedures, but, to interpret all these things in terms of health or morbidity, there is no substitute for the doctor, and the better trained and more experienced the doctor, the better it will be for all concerned

We hope that this will be emphasized in the new selective service program and be brought home to the families of the nation

Current Editorial Comment

Chemical Tests for Alcoholic Intoxication The too common practice, by those on duty in responsible positions often involving the use of machines in industry or on the highways, of drinking alcoholic liquor has raised many questions When is one drunk? At what point does it cease to be amusing comedy and become instead potential tragedy? What are the certain signs and symptoms of drunkenness? What is a good definition of "under the influence of intoxicating liquor?" Are there tests and established standards that point the way to answers? In a recent issue of *Industrial Medicine*, R N Harger brings together the latest data on this live subject [1]

Interesting bits of information include the following (1) normal body alcohol is infinitesimal and may be disregarded, (2) from the gastrointestinal tract of dogs, the absorption of alcohol is more than half complete in 15 minutes, and complete in two hours, (3) in the body, alcohol is stored in proportion to the water content of each tissue, (4) more than 90 per cent of this stored alcohol is burned by the body to carbon dioxide and water, less than ten per cent is excreted in the urine, sweat and breath, (5) the average adult can destroy in the body about one-third fluid ounce of pure alcohol per hour, (6) while the effects of alcohol on the digestive tract, heart, liver, kidneys, muscles, and the blood vessels of the skin are important, the chief effect is depression of the central nervous system With increased concentration of alcohol in the brain, the following stages of central nervous system depression may be recognized (*a*) impaired judgment, (*b*) muscular incoordination and more marked loss of self control, and (*c*) marked central nervous system depression ranging from slight stupor to surgical anesthesia

As in serious or fatal cases of poisoning with any one of many drugs, it has become the established practice, indispensable to accurate diagnosis, to determine the amount of the drug or poison in various tissues, so also it has become the accepted practice to test for alcohol the tissues of those suspected of intoxication This substitutes facts for opinions The facts are useful in confirming well based opinions In 1935, the Arizona Supreme Court gave a definition which has been copied by many other state courts "The expression 'under the influence of intoxicating liquor' covers not only all the well known and easily recognized conditions and degrees of intoxication, but any abnormal mental or physical condition which is the result of indulging in any degree in intoxicating liquors, and which tends to deprive him of that clearness of intellect and control of himself which he would otherwise possess If the ability of the driver of an automobile has been lessened in the slightest degree by the use of intoxicating liquors, then the driver is deemed to be under the influence of intoxicating liquor The mere fact that the driver has taken a drink does not place him under the ban of the statute unless such drink has some influence upon him, lessening in some degree his ability to handle said automobile"

With that definition in mind, the American Medical Association Committee on Street and Highway Accidents and the National Safety Council's Committee on Tests for Driver Intoxication made careful studies of the interpretation of the results of these chemical analyses Both committees followed three general principles (1) chemical tests should protect not only the nondrinker, but also the mild drinker who has not imbibed enough to be definitely affected, (2) any errors should favor the person being tested, and (3) allowance

[1] Harger R. N Industrial Medicine 17 52 (February) 1948

must be made for the fact that some people "carry their liquor" better than others In accordance with these principles, the committees selected two points in the blood alcohol scale 0 05 and 0 15 per cent (50 mg and 150 mg per 100 cc) Those two points divide drinking drivers into three groups, or zone I, zone II, and zone III The recommendations of the committees for the three zones are as follows Zone I, with a blood alcohol of 0 0 to 50 mg per 100 cc , shall be considered prima facie evidence that the driver is not under the influence, Zone II, with a blood alcohol of 50 mg to 150 mg per 100 cc —some drivers will be under the influence, but not all Here the recommendation is that the evidence be considered relevant, but not prima facie, and Zone III, with a blood alcohol above 150 mg per 100 cc , shall be considered prima facie evidence that the driver is under the influence With concentrations of blood alcohol of 400 mg per 100 cc most people would be unable to drive at all, and 500 mg per 100 cc is near the lethal point

Of two methods to determine the level of body alcohol, the first is a laboratory procedure in which the distillate from a body material is oxidized with dichromate in 1 1 sulfuric acid, and the excess of dichromate then titrated with a red reducing fluid containing methyl orange and ferrous sulfate in the same concentration of sulfuric acid The method has a sharp end point, possesses a good degree of accuracy and has been widely used The scarcity of trained chemists in most police departments, however, prompted the author and his coworkers to develop a simple method of testing the alcohol content of the breath It is a portable apparatus, jokingly called a "drunkometer," in which the expired air is allowed to bubble through a purple fluid composed of 1 cc of twentieth normal potassium permanganate in 3 4 sulfuric acid The purple fluid absorbs all alcohol from the breath, reacting quantitatively with the alcohol at room temperature The volume of alveolar air is measured by simultaneously determining the carbon dioxide, since normal alveolar air contains close to 5 5 per cent of carbon dioxide The alcohol content of 2,000 cc of alveolar air is equal to that in 1 cc of blood

Testing subjects for steering and braking, Newman of Stanford University found those with blood alcohol above 150 mg per 100 cc showed decreases of skill ranging from 16 to 24 per cent Goldberg of Sweden found universal detrimental effects of blood alcohol above 150 mg per 100 cc , and definite adverse effects with concentrations considerably below that point The studies of Holcomb at Northwestern University show that a driver with a blood alcohol in zone III (above 150 mg per 100 cc) has increased his probability of an accident fifty-five-fold, on the average

Where Is It? $10,200,800,000 has been paid into the Social Security Administration in eleven years and $849,000 000 collected in interest Benefits paid total $1,689,600,000 and administrative costs $246,000,000 The kitty remaining is over nine billion Where do you suppose it is?—*From the News Letter, American Medical Association, April 8, 1948*

There Is a Need A report from the New York State Nurses Association calls attention to the lamentable need for men nurses in the profession The covering letter states, "We believe that the survey shows that more young men should be recruited into the profession of nursing" With this conclusion we agree

World War II has acquainted all ranks of life with the fact that men are as capable of looking after men as women are, and, in many instances, far better qualified to do so

We are constrained to point out that the nursing profession starts out with a handicap It is, in the public mind, a unisexual profession In the dictionary's order of definition a nurse is primarily a "wet nurse." Secondarily, a nurse is the woman employed in a nursery to keep squalling brats in order She then ministers, with various good offices at the bedside of the dying In every one of these capacities, she is a woman The few instances, with some reservations, in which a man is employed in a nurse s capacity are in insane asylums, in this case he is hired because of his superior physical strength A profession handicapped with such a title is not likely to appeal to a normal man He

will not wish to bear a title that suggests that he is either a woman or a bruiser

In the armed services it is less embarrassing, when in need of the attention that the early hours of the morning call for, to shout for "Sister," rather than for "Miss" or "Lieutenant" Such ministrations should be as impersonal as possible, and, after a few tries, "Sister" comes trippingly off the tongue

The report points out that in the nursing profession, as in many another, men were the first practitioners They were friars who left their monasteries to go into the highways and byways to seek out and minister to the sick They brought them into the shelters that they could provide Such were known as "hospices," later as "hospitals," or "friendly places for the reception of guests" The friars were known as "Brothers"

We do not think men can be recruited to the ranks of nursing by reverting to their medieval appellation of "Brother" However, most of our readers will probably agree that few men will wish to enter a profession in which they are called "Nurse"

The nursing profession is as firmly entrenched in the hands of women as the medical profession, fifty years ago, was in the hands of men Men have let the bars down, at least to a certain extent, to women In the case of the nursing profession we urge women to do likewise There are many things that men can do for men that women cannot We submit that certain sex prejudices are not only right but proper There are services that men only should do for men Everyone who served in the recent war will testify to what the Medical Corpsmen, under the direction of their women officers, did for the sufferers of their own sex

The profession of a male nurse should fill many wants that are now outstanding Training should lead to continual advancement in his profession provided the candidate engaging in it comes in contact with men and women of sympathetic comprehension

The problem is one for the New York State Nurses Association Admit men to work with you on equal terms, invent a title for them that does not make them feel inferior, and you will have done something real for the improvement of society

THE INCIDENCE OF PULMONARY TUBERCULOUS "SPREADS" FOLLOWING THORACIC SURGERY AND ANESTHESIA

WILLIAM M PARKE JR M D * EDWARD R LOFTUS M.D , and HAROLD F BISHOP, M D , Valhalla, New York

(From the Divisions of Anesthesiology and Tuberculosis, Grasslands Hospital)

IN A previous report, the effects of anesthesia and surgery on patients with pulmonary tuberculosis were analyzed in reference to postoperative dissemination of the pulmonary disease [1] Two hundred eighty two anesthetic administrations for nonthoracic procedures were studied The incidence of postoperative spread was found to be 10 9 per cent.

This paper is a similar statistical review of the incidence of pulmonary tuberculous spreads following thoracic surgery Figures will be stated in reference to patient groups However most of the statistical percentages were determined on the basis of numbers of operations (rather than numbers of patients) Eight hundred five anesthetic administrations were performed on 367 patients between the years 1932 and 1947 in one hospital All the procedures were done on patients with active, moderately or far advanced, cavitary disease.

The criterion selected for determining the presence of a spread of the disease in the lung is x-ray evidence of an infiltration that persists or progresses over a period of at least a month postoperatively This criterion has been employed in the entire study Sputum volume and bacillary count are inaccurate measurements of the presence or extent of dissemination. The beginning collapse of tuberculous cavities, in which large numbers of organisms are present, and the resultant emptying of these cavities increase, at least temporarily the sputum volume and the Gaffky count. This response may be transient. Persistently positive sputum for several months into the postoperative period may indicate dissemination or residual cavitation These responses have been considered indicative of dissemination, but the correlation between effect and significance has caused them to be discarded on the basis of inaccuracy

Literature

In the past a great deal of controversy has existed regarding anesthesia for patients with pulmonary tuberculosis particularly those with active disease such as the patients who present themselves for thoracoplasty

Prejudice has existed against the use of ether in this regard. Apparently, the basis for that prejudice against ether for such patients arose from papers written three decades ago and were based on observation of open cone or drop ether Beecher has amply pointed out that the prejudice against ether is unwarranted and that three groups of workers have attacked this problem experimentally, and not one was able to substantiate the prejudice against ether [2]

Very little has appeared in the literature regarding dissemination of pulmonary tuberculosis following surgery The four following authors have mentioned this complication in relation to thoracoplasty

In 16 (10 7 per cent) of the 150 patients undergoing 430 thoracoplasties, Harrison and Berry found that there was some degree of spread of the disease following operation (accounting for two deaths) and a total of eight deaths during several months postoperatively [3] They state that the majority of these spreads were transitory that four spreads were ipsilateral, nine contralateral, and three not stated In 1941 Adams and Dufault observed 12 pulmonary exacerbations (4 9 per cent) within two months of 241 consecutive thoracoplasties [4] Seven were ipsilateral, and five were contralateral. In three of these cases, contralateral disease was present preoperatively Schaffner and Found, in discussing their use of spinal anesthesia for 335 thoracoplasties encountered ten postoperative spreads (3 per cent) [5] Eight of these spreads occurred in the

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City Section on Anesthesiology May 19 1948.

opposite lung, and two occurred in pre-existing disease In 1941, Cullen and his associates reported on their experiences with nitrous oxide anesthesia for 148 thoracoplasties on 73 patients [8] Two spreads (1 4 per cent) and two deaths occurred in this small series

Spreads

In this series of 805 procedures, 81, or 10 per cent, showed evidence of various degrees of spread in the postoperative period Eleven of those that spread died within a month following operation because of the spread Twenty-eight had extensions of major proportion, while another 19 showed slight but definite evidence of dissemination The remaining 23 had x-ray evidence of spread within one month which began to clear shortly thereafter

Tubercle bacilli were found to be present in the sputum at the time of operation 609 times (75 6 per cent) Of the 81 instances of spread, 74, or 91 3 per cent, had positive sputum at the time of operation In other words, 74 spreads occurred following 609 operations on patients with positive sputum, an incidence of 12 per cent Seven spreads occurred following 196 operations in patients with negative sputum, an incidence of 3 6 per cent

A slightly higher incidence of spread is noted in men than in women Ten and six-tenths per cent of the men showed postoperative dissemination, while 9 3 per cent of the women spread

A review of racial distribution revealed that most of the patients are white, with an incidence of spread of 8 8 per cent The Negro patients made up 16 per cent of the total number and had a higher incidence of spread (18 9 per cent) Also, it was observed that the spreads found in the Negro group were more extensive and of a more malignant character Only eight Oriental patients were in the series Three of these spread in the postoperative period

Postoperative Deaths

In the entire series, 27 patients (3 3 per cent) died in the postoperative period (up to forty-seven days) No patient died during operation In 11 of these cases, extension of the pulmonary tuberculosis was considered the cause of death In this group, death occurred from the third to the forty-seventh postoperative day All but two of these had positive sputum at the time of operation and developed bronchogenic spreads, usually massive in character The two patients with negative sputum developed hematogenous dissemination, which caused tuberculous meningitis in one case and generalized miliary tuberculosis in the other, and death occurred approximately five weeks postoperatively in each case The next largest group, five, died in shock on the first to the third postoperative day Four of the five deaths in this category occurred over ten years ago, when blood was not readily available and oxygen was not used routinely postoperatively Three patients developed bronchopneumonia and died within one week

The remaining eight patients died as a result of various complications, as follows

1 One patient had a sudden hemorrhage into the bronchotracheal tree, causing obstruction eight hours postoperatively

2 One patient developed a gradual obstruction of the bronchotracheal tree with mucopurulent material in spite of persistent endobronchial aspiration The patient refused to cough and died on the fourth postoperative day

3 Sudden death in one patient on the sixth postoperative day was due to pulmonary artery thrombosis

4 A sudden fatal hemorrhage in one patient occurred on the forty-first postoperative day caused by erosion and rupture of the left axillary artery

5 One patient developed pulmonary edema on the third postoperative day, and in spite of therapy he expired on the eleventh postoperative day

6 One patient developed mediastinal emphysema, most marked on the fifth day, which failed to respond to treatment This patient died on the tenth postoperative day

7 One patient died on the fourth postoperative day with marked paradoxical respiration and mediastinal herniation following the resection of five ribs

8 One patient with poor respiratory reserve developed marked dyspnea, refused oxygen therapy, and died on the twenty-sixth postoperative day

Chronologic Review

As it has been stated, 805 major thoracic surgical procedures were carried out on patients with pulmonary tuberculosis in the sixteen-year period from 1932 through 1947 A majority of these (755) consisted of various stages of thoracoplasty, while the remaining 50 included lobectomies, cavernostomies, thoracotomies, and extrapleural pneumothorax

Thirty-six different combinations of anesthetic agents and technic were employed Many were tried only once or twice and were discarded because they were not safe, adequate, or satisfactory in some respect In general, four definite phases of anesthesia procedure may be seen in reviewing this series

The first phase lasted four years (1932 to 1935), during which time 158 procedures were done Local anesthesia alone was used at first, but soon this was used in conjunction with nitrous oxide and/or avertin, and by the end of this period the local infiltration was eliminated except occasionally when it was used alone for "poor risk patients." The incidence of spread in this period was 9 5 per cent.

In the second phase, lasting two years (1936 to 1937), 113 operations were recorded Cyclopropane was introduced and used with avertin on most of these occasions Also, for the first time in this series, endotracheal tubes were employed. Eight and eight-tenths per cent showed spread in the immediate postoperative course in this two-year period

In the third phase, which lasted eight years (1938 to 1945), 410 operations were performed with an incidence of spread of 10 0 per cent. Although there were some variations, inhalation technic employing an endotracheal tube and cyclopropane was the anesthesia for most of these procedures It was at the midpoint in this eight-year period that the hospital opened its own blood bank and blood became more readily available. Up until this occurred, patients were often transfused preoperatively in preparation for surgery, but no blood was given postoperatively or during operation, unless other attempts at replacement failed. Since that time, blood has been made available to the patients not only preoperatively but has been administered during and after operation

The fourth and last phase of this chronologic review lasted two years (1946 to 1947) and includes 124 procedures. The change in anesthesia which typified this particular period was the use of ether as the chief agent for maintenance during surgery following a cyclopropane induction. Endotracheal tubes were used routinely The use of intravenous procaine during and after operation was initiated in this period to afford relief from postoperative pain with retention of cough reflex. The incidence of spread during the immediate postoperative course in this two-year period was 8 per cent.

Anesthesia

Thirty-six different combinations of anesthetic agents and technics were employed Seven hundred eighty three were general in type, while 22 were regional or local without any supplementary general anesthesia. No spreads occurred in the latter group

Endotracheal tubes were used in 494 anesthetic administrations with an incidence of 10 9 per cent spread. No tube was employed in the remaining 289 general anesthetics. In this group, the incidence of spread was 9 3 per cent

Anesthetic drugs used included cyclopropane, avertin, nitrous oxide, ether, ethylene, chloroform, sodium pentothal, evipal, and procaine.

In an effort to determine which agent, if any, was associated with a particularly high incidence of spread of the pulmonary disease, the anesthetic drugs were considered separately The following analysis indicates the number of times that a particular drug was used alone or in conjunction with other agents

Cyclopropane was used 598 times with an incidence of 10.2 per cent spread. Avertin was used 221 times with an incidence of 11.3 per cent spread. Nitrous oxide was used 168 times with an incidence of 10 0 per cent spread Ether was used 107 times with an incidence of 5 6 per cent spread. Procaine (local, etc) was used 117 times with an incidence of 11 1 per cent spread The remaining agents, ethylene, chloroform, sodium pentothal, and evipal were used too seldom to evaluate their effects

Summary and Conclusions

1 An analysis of 805 anesthetic administrations for thoracic surgery in the treatment of pulmonary tuberculosis is presented

2 These procedures were completed during the sixteen-year period from 1932 to 1947

3 Chronologically, the series fell into four phases, each characterized by a particular form of anesthesia. These phases and results are described

4 In an effort to determine whether postoperative pulmonary disseminations are related to the use of specific drugs or technics, these various factors were analyzed and the results are presented

It was found that 10 per cent of the entire series of anesthetic administrations showed evidence of varying degrees of dissemination, although there was no appreciable difference in the percentage of dissemination between men and women. However, the incidence of spread in Negroes was approximately twice that found in white patients.

5 The predominant number of spreads were found among those patients with tubercle bacilli in their sputum at the time of operation

6 No particular anesthetic drug or technic was found to be responsible for spread

7 The incidence of pulmonary tuberculous spreads following 805 thoracic operations was found to be the same as the incidence following 282 nonthoracic procedures in patients with pulmonary tuberculosis

Discussion

Edward R. Loftus, M D ,*Valhalla (By invitation)* —Patients undergoing thoracic surgery do, of necessity, accept a greater risk of dissemination than in other types of procedures The most common form of dissemination is bronchogenic This form of extension is facilitated by overmedication preoperatively with loss of cough reflex and pooling of infected secretions to the dependent, healthier lung The position that must be assumed by the patient on the operating table allows drainage, carrying infected sputum, to the healthier lung The early popularity of local anesthesia was in great part due to preservation of the cough reflex

The presence of secretions, which may be appreciably increased postoperatively following collapse of cavitational disease, is a most important reason for bronchogenic dissemination Thus, the special importance of frequent suction during surgery with complete evacuation of the tracheobronchial tree postoperatively, preferably by endotracheal tube or by bronchoscopic means, is realized

There is another mechanism in operation which is not emphasized as much as these well-known factors The risk of dissemination is also dependent in part upon altered respiratory physiology and changes in the mechanics of respiration With the loss of a portion of the thoracic cage, there is present in every case some degree of paradoxical respiration The intrapulmonary pressure in the diseased lung is transiently decreased over that of the contralateral lung at the beginning of expiration There is also a lag of air flow to this region on both inspiration and expiration, which is attributed to the lack of support of the chest wall

This allows infected material to be carried farther out into the pulmonary parenchyma With the loss of normal lung resiliency due to disease, therefore, neither expiration nor inspiration will facilitate expulsion of infected sputum If the mediastinum is labile and the chest wall firmly supported, wide fluctuations of the mediastinum may occur, resulting in flutter or pendulum breathing This tends to diminish the ventilatory efficiency of the healthier lung, placing it under greater strain and allowing infected sputum to remain in the bronchial tree even in the presence of an active cough reflex In reality this process is a problem for the surgeon It functions dangerously only when the chest wall loses its support after the resection of more than four ribs

The type of anesthesia apparently does not play a major role in the cause of dissemination Ether has been condemned by some on the basis that it markedly increases the amount of secretion The incidence of postoperative dissemination has been variously quoted from 4 to 15 per cent In a recent report of the Veterans Administration, the incidence of extension of pulmonary tuberculosis in moderately advanced and far-advanced disease on bed rest alone was approximately 8 per cent Therefore, an overall percentage of 10 per cent would warrant the risk when the possibility of complete control of the disease now approaches 85 per cent

In the chronologic review of thoracic surgery and anesthesia over the past sixteen years, the major advances have been in technic

Perhaps now another phase has been entered in which the emphasis will be placed upon preoperative and postoperative use of streptomycin in selected cases This drug will probably alter the existing percentages of dissemination to some degree It should not, however, be used routinely in preparation for thoracoplasty It has been shown that 90 per cent of patients operated had not had postoperative dissemination, and it would appear unwise to use a drug with limited value and toxic manifestations and run the risk of developing a resistant strain of organism when the use of the drug may be valuable at a later date

However, streptomycin appears to have a definite place in the control of exudative disseminations before surgery and in those instances in which a spread may occur postoperatively

ARMY SYPHILIS RECORDS

The Veterans Administration has in its custody the majority of syphilis records of those Army personnel who were treated for this disease while in active service and in many instances can procure informative data from the syphilis records of other than Army personnel. It is thought that many physicians treating veterans for syphilis as private patients would find a résumé of the syphilis record useful, since the details of treatment, results of spinal fluid examinations, and blood serologies are incorporated in the records Résumés of these records are available to physicians who are treating such veterans, provided authorization for the release of the data is given by the veteran Requests for the résumés, accompanied by an authorization for the release of the data, dated and signed by the veterans, should be addressed to the Dermatology and Syphilology Section, Veterans Administration, Munitions Building, Washington 25, D C It is most important that the veteran's service serial number and other identifying information, such as the date of enlistment, the date of discharge, rank, and organization be included

Ordinarily, the résumés can be furnished in approximately two weeks from the date of the receipt of the request and signed authorization

THE INTRATHECAL USE OF PITRESSIN FOR THE PROLONGATION OF SPINAL ANESTHESIA

OSCAR H STOVER, M D Buffalo, New York

(From the Deaconess Hospital)

THE ATTEMPT to find a drug which may be added to a solution of a local anesthetic to prolong its action is certainly not new From the very early days of local anesthesia it was soon apparent that this was a desirable attainment The anesthetic action of a solution may be prolonged by any means which delays its absorption from the area in which it has been placed

The most obvious way to accomplish this was by mechanically decreasing the blood supply to the area In the case of the extremities this could be done through the use of a tourniquet In other locations it was far more difficult to accomplish Also this method was unpleasant for the patient and tended to engorge the operating field

At one time, local applications of cold, produced by an ethyl chloride spray, were successfully used to prolong cocaine anesthesia This was merely another way of reducing the blood supply to a certain localized area, thus keeping the solution concentrated in the locale where it was injected Not only was the action of cocaine lengthened, but a decided increase in its action was produced Wiener, Schleich, and others used this method to produce anesthesia for the extraction of teeth It was also discovered that under these conditions more dilute solutions could be used

Another way to lengthen the effect of a local anesthetic is to add some substance to the solution which will delay absorption of the drug Braun used suprarenin in 1903 to lengthen anesthesia and reduce toxicity It produced an area of local anemia, thus delaying the absorption of the anesthetic solution, thereby increasing its length and also reducing its toxicity In Shield s English translation of Braun s work *Local Anesthesia*, many of these early experiments are described [1] In summing up the results of his experiments Braun says that the anesthetic properties of novocaine are enormously increased by the addition of suprarenin

To anyone who administers spinal anesthesia, the period of action of the drug used often becomes the factor determining whether or not spinal anesthesia shall be employed There are a number of drugs used to produce spinal anesthesia These drugs differ somewhat as regards margin of safety and duration of action It is well known that other agents produce longer spinal anesthesias than procaine, but it has been established that of all the agents used, procaine is one of the safest Southworth and Hingson state that a duration of time up to one hour may be obtained using procaine as the anesthetic agent [2] A great many operations exceed this time Often because of this, the operator must hurry or must use an agent other than procaine He may be forced to supplement some other type of anesthetic to complete the surgical procedure An increased anesthesia time using procaine as an anesthetic would definitely be desirable.

Suprarenin was the first substance used intrathecally to prolong the duration of anesthesia This was done many years ago by Doenitz when he compared the action of cocaine solutions with that of cocaine and suprarenin injected into the spinal canal of cats [1] He felt that the anesthesia time was lengthened and that the toxic reactions of cocaine solutions were not only delayed but diminished

In 1927 Pitkin introduced spinocaine in a successful attempt to increase the length of time of spinal anesthesia through the use of novocaine. This increased length of anesthesia was accomplished by the addition of starch in the form of gliadin, which had the effect of slowing the diffusion of the solution in the spinal fluid and delaying its release to the nerve tissues The duration of anesthesia was prolonged over that of plain solutions of procaine The recommended dose was, however, considerably greater than the ordinary plain solution and this may in part account for the increased length of anesthetic time

In 1940 Lemmon reported a method of continuous spinal anesthesia by the injection of additional doses of procaine as needed through a needle left in the canal [3] By this method anesthesia was prolonged indefinitely It requires a special technic and apparatus however Associated with this method are always the possibilities of complications such as the displacement of the needle, the introduction of trauma or infection

In 1947, Romberger and Ratcliff mention using adrenalin and, subsequently ephedrine in a series of cases.[4] They report a measurably prolonged

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York, N w York City Section on Anesthesiology May 19 1948.

anesthesia time by the addition of these drugs Anesthesia, however, came on slowly

In 1935, I became interested in the possibility of prolonging the effects of procaine intrathecally Adrenalin was used in a few cases, but I was concerned about producing too great an ischemia in the cord and thus doing some permanent damage There was also a question of the possibility of an excessive rise in blood pressure

About this time I was interested in pitressin Pitressin is an aqueous solution of the pressor-diuretic-oliguric fraction of the posterior pituitary It is standardized to correspond to twice the pressor activity of the U S P Pituitary Solution (20 Parke Davis and Company units per cc) The pitressin used was from the regular ampules manufactured by Parke Davis and Company

Upon raising a wheal with a solution of procaine and pitressin, certain facts are soon evident, namely, that the local ischemia produced by pitressin is not nearly as marked as that produced by adrenalin under similar circumstances Also, the length of anesthetic time of a procaine-pitressin solution is much longer than that of a procaine solution alone This prompted further investigation

I searched for some consistent way to demonstrate the holding power of pitressin I determined the minimal lethal dose of strychnine per Gm for rats, which, upon injection, would produce a convulsion within a few minutes The same volume of solution was always injected in the same location intramuscularly If pitressin actually had the power to decrease the rate of absorption of a fluid, its addition to the strychnine solution should delay the onset of convulsions

The calculated dose of strychnine was always dissolved in the same amount of water When pitressin was used, 1 cc of pitressin, or 20 units, was added to 100 cc of water This stock solution was used as the solvent for the strychnine in the same volume as the plain water and strychnine solution Injections were made intramuscularly in the same area When adrenalin was used, the same procedure was followed There was an adrenalin concentration of 1 50,000 in the injected solution In all, several hundred injections were made, those listed in Fig 1 are regarded as typical

From these experiments it was evident that the addition of both adrenalin and pitressin delayed the onset of convulsions caused by the injection of a minimal lethal dose of strychnine in rats Part A of Fig 1 shows the time variations after injection of the plain strychnine solution before the onset of the first convulsion These variations may be due either to differences of sensitivity in various rats to strychnine, inability to make the injection intramuscularly, or a combination of both The average time for the onset of the first convulsion was approximately seven and one-half minutes

Part B of Fig 1 shows the ability of a 1 50,000 solution of adrenalin to delay the onset of convulsions The average time was approximately twenty-nine and one-half minutes Part C of Fig 1 shows the effect of the addition of pitressin in delaying the onset of convulsions The effect was greater than that of adrenalin by an average of ten minutes This method of studying holding time is more accurate than using adrenalin or pitressin in solutions of procaine and trying to determine the presence or absence of anesthesia The onset of a convulsion can be accurately timed, whereas the determination of the presence or absence of anesthesia may involve certain personal equations

Having, to my mind, satisfactorily established that pitressin had the power to delay absorption of a drug, I now became interested in the possibility of untoward side reactions According to Sollman, an injection of pitressin causes a rise in blood pressure [5] This rise is not as great as the rise following the injection of epinephrine The rise in blood pressure, however, lasts longer due to vasoconstriction This vasoconstrictor action is peripheral, because it will occur in perfused organs The muscle fibers of the capillaries are more sensitive than the arterial muscle, where

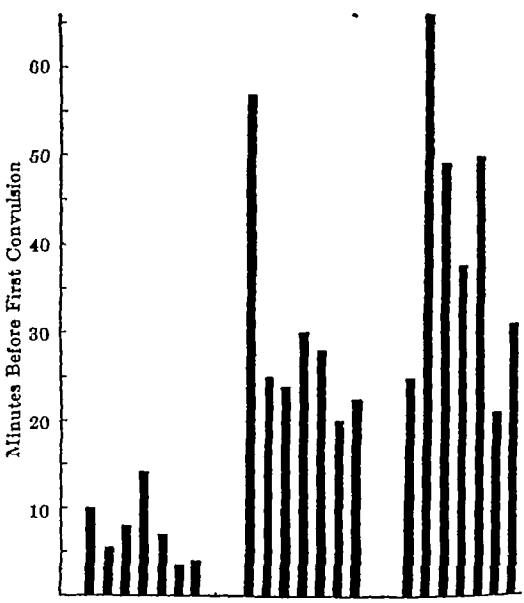

FIG 1 Effect of pitressin and adrenalin on delaying the onset of convulsions due to the injection of strychnine in rats

most of the action of ephinephrine takes place Thus vasoconstriction by pitressin extends to the coronary arteries The contractions of an excised heart are strengthened by pitressin, but the intact heart is weakened, due, undoubtedly, to coronary constriction.

A number of investigators have studied the effects of an injection of pitressin on the human circulation Graybiel and Glendy studied the circulatory effects of the intravenous administration of pitressin in normal persons, hypertensive patients, and those suffering from angina pectoris [4] The dose they employed was far greater than the dose I employ in my use of pitressin in spinal anesthesias I shall take the liberty of quoting them directly in some of their conclusions

Significant cardiovascular symptoms were observed neither in the normal persons nor in the patients with heart disease. There was evidence of marked constriction of the minute vessels and of the large arteries but not of the arterioles There were only slight changes in the pulse rate, blood pressure metabolic rate, and cardiac output.

Anginal pain was not reproduced in two patients with severe coronary heart disease who received sufficient pitressin to cause uncomfortable abdominal cramps. A minute amount of adrenalin when given to one of these patients produced anginal pain It is suggested that in certain respects pitressin and adrenalin act in an opposite manner the former causes coronary vasoconstriction but a decrease in the work of the heart, while the latter causes coronary vasodilation but an increase in the work of the heart.

Pitressin in therapeutic amounts may be given without fear of untoward cardiovascular effects.[4]

Since 1038 I have used pitressin routinely in 2,500 spinal anesthesias with procaine as the anesthetic agent Most of these cases were done at the Deaconess Hospital, Buffalo The only cases of spinal anesthesia in which pitressin is omitted are those in which the shortest possible spinal anesthesia is desired This would indeed represent a very small number

The technic employed is very simple. Ampules containing 200 mg of procaine (Abbott or Squibb) or novocaine (Winthrop) are used The 200 mg are dissolved in 5 cc of distilled water, to which are added five drops of pitressin from a 23-gauge needle Each cc. of solution represents 40 mg of procaine and approximately 1/4 unit of pitressin. Thus, an average dose of 3 cc of solution would represent 120 mg of procaine and 3/4 unit of pitressin In actual practice two to three minutes prior to making the spinal tap either 50 mg of ephedrine or 20 mg of methedrine are injected intramuscularly in the region of the buttocks. This helps to counteract any blood pressure drop Injection of the anesthetic solution is made in the usual way A dose of 120 mg of procaine and pitressin will usually give up to one and a half hours of operative anesthesia for abdominal work.

The dose of procaine varied from a low dose of 90 mg to a high dose of 130 mg For operations not involving the abdomen, 80 to 90 mg of procaine and pitressin will give two hours of operative anesthesia For abdominal work to umbilicus 120 mg., with 130 mg for work above the umbilicus will give better than one and one-half hours of operative anesthesia. In each case an average preclinic injection of morphine and atropine was used It has been my custom to supplement spinal anesthesia with sodium pentothal when the patient displayed unusual nervousness The dose is usually so small that long before the operation is over the patient is fully conscious so that there can be no doubt that operative anesthesia is present One can also observe that anesthesia comes on quickly fully as quickly as with procaine alone. Clinically, these patients are usually very comfortable, and ordinarily, there have been no serious blood pressure disturbances and little nausea. There have been no deaths on the operating table and none caused directly by the spinal anesthetic.

When this method was first employed, no preanesthetic blood pressure stimulant was used During this period blood pressure drops were far more frequent Ephedrine was first used routinely, mainly because it dilates coronary vessels and might therefore, counteract any possible coronary constrictor effects of pitressin It was very satisfactory However, we now also use methedrine in about one-half of our cases, and this works equally as well

The longest spinal anesthetic with procaine and pitressin was for a nephrectomy The operative time was three hours This was a longer operative time than can usually be obtained I have not made any attempt to determine routinely how long these patients had satisfactory operative anesthesia beyond what was needed to complete the surgical procedure. From my experience with pitressin, however, I can safely say that one can obtain one and one-half hours of satisfactory operative anesthesia for upper abdominal work with an increase in duration of anesthesia for work in the lower abdomen

Conclusion

I have found pitressin to be a drug that has the ability to delay the absorption of procaine from the tissues It may be used safely with procaine or novocaine in spinal anesthesia. By using it in spinal anesthesias with procaine, one can obtain a considerably longer anesthetic effect than by using this drug alone

Discussion

John H Geckler, M D , *Buffalo* —It was during my last year of residency in 1941 that Dr Stover first suggested this pitressin technic of prolonging procaine spinal anesthesias I was not very hopeful because I had already tried all the vasoconstrictor drugs with which I was familiar at the time—epinephrine, ephedrine, paredrine, and neosynephrine None of them, in the concentration I used, had been particularly promising The literature, however, showed that pitressin had its greatest effect on the capillaries, and so was worthwhile trying The coronary constriction did not concern me too much because my routine at the time consisted of prespinal ephedrine administration Moreover, the actual amount of pitressin used was only about a minim (There are more than 80 drops per cc through a 25-gauge needle)

The first case was a nephrectomy and lasted an hour and twenty minutes The second was a cholecystectomy, and when it was finished in a scant hour and a half, the effect of the 120 mg I used was still holding very well. Since then, I have used the technic whenever I thought that more than three-quarters of an hour of anesthesia was required

There is very little difference in the way procaine acts with or without pitressin other than in the duration of anesthesia There is no delay in the onset of anesthesia, but I believe there is a prolonged fixation time One seems to be able to influence the height of anesthesia by tilting the table for at least fifteen minutes after injection My approach has not been too scientific, for I hesitate to annoy any patient with a series of pinpricks when the results will influence neither the conduct of that particular case nor of any other My attitude is more than a clinical impression, however I might call it a clinical conviction

With good, longer-acting anesthetics like pontocaine, nupercaine, and metacaine, perhaps a continual search for technics to prolong procaine anesthesia is not necessary However, I should think that the majority of spinal anesthetics are given by men who are not full-time anesthetists A good many, I am sure, either do not have the volume of cases necessary or perhaps have not bothered to master the use of the other drugs Procaine may be their standby, and a good one it is

For them, and for any one, a drug which will prolong anesthesia without appreciably influencing one's own particular technic is worth trying This "one's own particular technic" factor is important. When one has used a drug with uniformly good results he feels strangely not so confident in others under the same conditions I have a colleague who prefers pontocaine, and the circulating nurse is almost as surprised when he asks for procaine-pitressin as when I ask for pontocaine

I have wondered how pitressin would act with the other drugs, pontocaine, for instance However, we do not do enough two- to four-hour operations under spinal anesthesia to make it practical to test the drug, and the test of its adequacy is in the operating and not in the persistence of anesthesia to pinprick.

In short, I like the technic, and I hope the procaine users will try it

PLANT-FRUIT EXTRACT AIDS HEART DISEASE PATIENTS

A "powerful drug" for treating heart disease was announced at the meeting of the Inter-American Cardiological Congress, in Chicago

"Distinct improvement" in 140 of 250 patients and "moderate improvement" in another 85 patients given daily doses of the drug were reported by Dr M R Kenawy of Cairo, Egypt Only 25 of the group showed no benefit

The drug is called khellin It is extracted from the fruit of a plant growing in the Middle East The fruit is called Amni visnaga

Khellin is a powerful dilator of the blood vessels of the heart Constriction of these blood vessels, with decreased blood supply to the heart muscle, is the trouble in some kinds of heart disease Khellin's dilating action is very prolonged, lasting for many hours It is apparently nonpoisonous

Because of its antispasmodic action, khellin also has been found suitable in treatment of bronchial asthma

For clearing the swelling, or dropsy, in advanced heart failure, lots of water, some acid and a moderate reduction in salt are needed, Dr F R Schemm, of Great Falls, Montana, declared

This treatment scheme succeeded in four fifths of 322 instances But in 160 other instances, the swelling was not cleared when only two of the three measures were used No two succeeded alone, even when salt was completely removed from the diet, or as much as eight quarts of water were given daily, or when heavy doses of acids were given with one or the other measure But much less drastic salt restrictions, acid doses, and water drinking when used together produced "dramatically" good results —*Science News Letter, June 19, 1948*

INTRAVENOUS PROCAINE IN THE MANAGEMENT OF THE INJURED HAND

DAVID J GRAUBARD, M D , MILTON H WALDMAN M D , New York City and MILTON C PETERSON, M D ,* Kansas City, Missouri

(From the Traumatic Surgical Service Reconstruction Hospital Unit New York Post-Graduate Medical School and Hospital, and the Department of Anesthesia, Research Hospital, Kansas City Missouri)

THE THREE cardinal principles in the treatment of the injured hand are the reconstruction of the anatomic structures, the prevention of sepsis, and the maintenance of function.[1] Adequate surgery and the judicious use of antibiotics and chemotherapeutic agents usually produce satisfactory results However, in some cases, even though reconstruction has been competent and infection prevented, complete or partial loss of function persists It is in this small group that the use of intravenous procaine has produced gratifying results

It is beyond the scope of this paper to review the many types of trauma to the hand or to evaluate the modifications of surgical procedures used It is our desire to describe a single method and the results obtained by it in the management of the injured hand

Pathologic Physiology

Disturbance of function is as a general rule an expression of a structural lesion but it is generally agreed that functional disturbances do not always accompany every discernible anatomic lesion Research by Claude Bernard and Maurice Raynaud in the physiology and pathology of the autonomic nervous system has demonstrated that the imbalance of the sympathetic and parasympathetic systems develops those polymorphic clinical symptoms which, in their early state, are independent of structural changes. As a result of repetition of stimulation, however an anatomic lesion may appear, manifesting not the cause of dysfunction but its consequence At first the structural changes are discrete and reversible being fused and irreversible later [2]

Trauma initiates an excitation of nerve impulses along vasomotor afferent neurons This may produce excessive vascular disturbances accompanied by edema, muscular spasm and pain In our previous reports on the pathologic physiology of inflammation and trauma, we suggested that the pain syndrome is produced by the dysfunction of the capillary unit the pathologic changes in the sympathetic ganglia, and the disturbance of the humoral balance [3-5]

It has been suggested that there is a shunt of efferent sympathetic impulses into the sensory somatic fibers at the site of injury to a nerve [6-8] The stimulation of the peripheral or primary neuron by direct injury or by an irritative process at the disturbed axon reflex arc will produce a causalgic state [9] It has been stated that lesions of peripheral nerves may produce the signs of causalgia without any of the symptoms [10] Identical vasomotor disturbances have been classified as Weir Mitchell's causalgia, Vulpeau's 6tat physiopathique Sudeck's atrophy Leriche's post traumatic osteoporosis, peripheral trophoneurosis, and chronic traumatic edema [11] Evans suggests that these entities be grouped as reflex sympathetic dystrophy [12]

Peripheral pain is intimately related to disturbances in the capillary bed The control of the distribution of blood in the capillary bed depends primarily on functional activity and the inherent neurogenic and humoral balance A traumatic or inflammatory stimulus will produce vasomotor disturbances of decreased capillary function, which in turn produces hypoxia With hypoxia and hydrogen ion concentration changes, capillary porosity takes place. It is at this stage that pain becomes noticeable [3] If an irritative process persists at this level a pathologic state of the sensory nerve fibers develops, which in turn produces a central disturbance at spinal and even cerebral levels

It is evident that the interruption of pain impulses, immediately following trauma, will help prevent a vicious circle of reflexes and in an established case of reflex sympathetic dystrophy will not only limit the pain impulses from spreading to a higher level but will also depress the irritable focus

When procaine is administered intravenously, it reaches the dysfunctioning capillary bed and anesthetizes the irritated nerve endings. The resulting relief of pain is usually accompanied by increased mobility and improved circulation.

Method

Since our preliminary report on the use of intravenous procaine, the only change that we have made in the preparation of the solution has been the addition of vitamin C either as sodium ascor

* By invitation.

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City Section on Anesthesiology May 20 1948.

bate or ascorbic acid [3 5 13 14] One gram of vitamin C is added to 1,000 cc of isotonic saline solution containing 1 Gm of procaine hydrochloride **

The dosage prescribed is based on the "procaine unit" 4 mg procaine hydrochloride per Kg of body weight to be given in twenty minutes [3 15] To obviate the necessity of counting drops, the "flowrator," an instrument which accurately measures the rate of flow of intravenous fluids, is used [15] In a small percentage of cases, because of the patient's apprehension, it is advisable to give, as the initial infusion, one-half of the dosage prescribed by decreasing the length of time to a period of ten minutes None of our cases are premedicated with barbiturates

Addition of vitamin B complex to the procaine hydrochloride-vitamin C solution has not proved satisfactory Clinical evidence seems to indicate adsorption of the procaine radical to the vitamin B complex, thus inhibiting the action of procaine [16]

In over 3,000 infusions of procaine hydrochloride, we have encountered no untoward reactions It should be noted that when intravenous procaine is used in a 0 1 per cent concentration, it is an analgetic and not an anesthetic Variations which have been observed in the general analgetic effect of procaine administered to the same individual in the same dosage but on different occasions seem to be dependent on the status of the humoral balance Although the relief of pain is the sole guide to the effectiveness of this treatment, we have noted physical signs and radiologic changes indicative of recovery ,

Clinical Data and Case Reports

This report is based on 28 cases in which trauma involved the fingers, the hand, or those contiguous structures which produced hand symptoms Two cases of phantom limb are included in this series Eighty-five infusions were given to these patients Table 1 lists the number and types of cases, the number of infusions administered, and the results obtained

Reflex Sympathetic Dystrophy —The causative factors in the 21 cases of reflex sympathetic dystrophy are as follows Colle's fracture, 5, metacarpal fracture, 3, carpal fracture, 2, tenosynovitis, aseptic, 4, contusion of palm, 1, laceration of median nerve, 1, traumatic arthritis, 1, laceration of finger, 2, puncture wound of finger, 1, and abscess of finger, 1 Mitchell, Moorehouse, and Keen were the first to present a clear and complete description of this clinical entity [17] The pain syndrome can be produced by even a minor injury, and its intensity may vary from the most trivial burning to a state of torture The reaction on the body economy is such that the general health is often seriously affected

The following cases which are illustrative of the classic description of this condition typify the results that we have obtained by the use of intravenous procaine

Case 1 —J S is a 59-year-old elevator operator who, on November 25, 1946, caught his left hand in an elevator gate He had some pain in the hand but continued to do some work A week later he developed a felon of the distal phalanx of the left index finger which was treated by surgery and antibiotics The wound healed within two weeks. However, he complained of a severe burning pain arising from the scar and radiating up the hand and forearm. Touch and weather changes aggravated the pain. Physical therapy during the following four-month period produced no amelioration of signs or symptoms

When first referred for intravenous procaine therapy, the patient was extremely apprehensive and nervous and walked about with his right hand shielding the left Only a superficial examination was done because of the reluctance of the patient to withstand additional pain The skin over the left index finger was shiny and cyanotic Motion in the finger and the rest of the hand was limited Figure 1 shows the appearance of the injured hand and the maximum extent of flexion at the time of examination, September 9, 1947 Figure 2 is a radiograph revealing the extent of osteoporosis present

The patient received a total of four procaine infusions given at three-day intervals Physical therapy was instituted after the second infusion to hasten muscular recovery He was discharged and able to return to work three weeks after institution of treatment. Figure 3 shows the improvement in mobility at the time of discharge, when there was no pain, diminished cyanosis, and no vasomotor disturbances

TABLE 1

Type of Case	Number of Cases	Number of Infusions	Relief of Pain Good	Fair	Poor	Increased Function Positive	Negative
Reflex sympathetic dystrophy	21	62	17	3	1*	20	1*
Phantom limb	2	16	1	1			
Fracture	2	2	2			2	
Contusion abrasion, and laceration	2	2	2			2	
Trigger finger	1	3			1		1
Total	28	85	22	4	2	24	2

* This patient received only one infusion of procaine and did not return for further treatment.

**The procaine hydrochloride used was the product "Novocain" donated by the Division of Medical Research Winthrop-Stearns, Inc., New York City

FIG. 1. Case 1, J S Maximum amount of flexion of fingers prior to treatment.

FIG 3 Case 1, J S. Improvement in mobility at time of discharge September 30 1947

Prior to treatment, this man's disability was valued on the basis of a hand The final award was reduced to a partial permanent disability of a finger

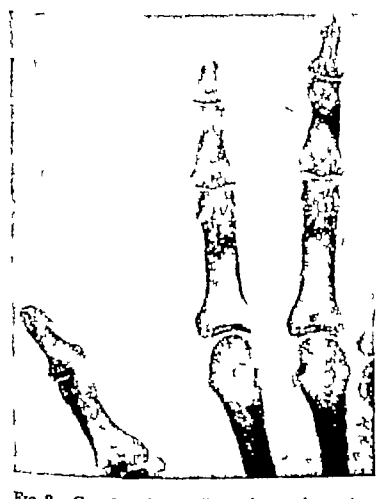

FIG 2. Case 1 J S Radiograph revealing osteoporosis of left index finger

Case 2.—C B a 32-year-old seamstress sustained a puncture wound on the ulnar side of the distal phalanx of the left index finger on August 28, 1947 Following surgical exploration, two fragments of a broken needle were removed. The wound healed by primary intention. Soon afterwards, pain developed in the finger and spread up the hand. At the time of referral on December 11, 1947 the patient exhibited limitation of motion severe pain, cyanosis of the fingers, and marked hyperhidrosis of the hand. Radiographic study showed osteoporosis of the affected digit.

This patient received a total of seven intravenous procaine infusions over a four-week period She made a good recovery signified by the absence of pain, increased mobility and ability to return to work. As in the preceding case, the original disability was computed on the basis of a hand, whereas final settlement was made on the basis of a finger

Case 3.—L. J is a 50-year-old housewife who about four weeks prior to her admission on June 6 1946 pounded the palm of her right hand repeatedly against a spade she was using in her garden. The hand and wrist became swollen, painful and disabled. On admission the patient complained of pain, swelling, redness, excessive sweating of the hand, and inability to use her right hand. A diagnosis of contusion sprain of the wrist and hand was made, and the hand was immobilized. Radiographic examination at that time revealed no abnormality (Fig 4)

The patient returned three weeks later June 27 1946 complaining of the same signs and symptoms Radiographic examination revealed osteoporosis,

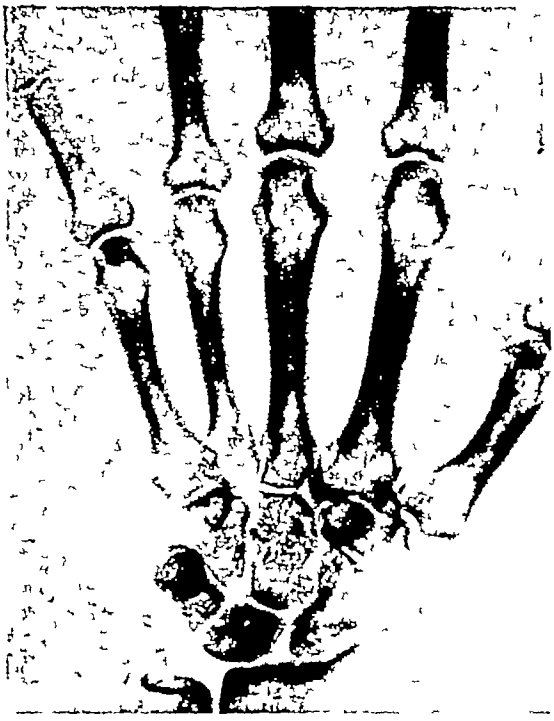

FIG 4 Case 3, L J Radiograph of the right hand, revealing no evidence of abnormality

(Fig 5) Intravenous procaine therapy afforded immediate relief of pain The patient received a total of four infusions in the following three-week period

When discharged on September 9, 1946, the patient had made an uneventful recovery A radiograph at the time of discharge revealed moderate recalcification (Fig 6)

Phantom Limb —It is difficult for us to understand the complaint of an amputee who states that he has sensation in his absent extremity However, 95 per cent of these patients make this complaint [18] If this sensation is painless, it disappears in time But a small percentage of amputees suffer from a severe burning, boring pain with the feeling of compression, or constriction or malposition of the amputated parts [19] The following case is characteristic

Case 4.—A L, a 58-year-old woman factory worker, sustained a crushing injury of the left hand and wrist in 1942 Following amputation at the upper third of the forearm, the patient complained of severe burning pains in the palm with extreme dorsiflexion of the wrist of the absent extremity The pain, which came on in spasms, was so severe that it was necessary to resort to opiates In April, 1947, a revision of the stump was done, and several neuromata were removed Although surgery relieved some of the lancinating pain, the sensation of clenched fingers remained Six infusions of intravenous procaine were given beginning on October 23, 1947 Although some mild parasthesia persisted at the time of discharge, the patient was sufficiently relieved to enable her to obtain a clerical position

FIG 5 Case 3, L J Radiograph revealing osteoporosis (Sudeck's atrophy)

Fractures —Bunnell considers post-traumatic stiffness of the hand to be the major problem in the treatment of fractures and dislocations of the hand [20] This post-traumatic loss of mobility may depend on the age of the individual, impairment of the nerve supply and the resulting trophic changes in the skin, or circulatory disturbances which produce edema, osteoporosis, and atrophy [21] The use of intravenous procaine in this type of case is very satisfactory, for the relief of pain encourages the mobility of the digits

Case 5 —P G, a 28-year-old bartender, was injured on March 28, 1947, when a barrel crushed his right hand Radiographic examination revealed a fracture of the fifth metacarpal bone at its proximal portion There was severe pain, swelling over the dorsum of the hand, and loss of mobility Following reduction and immobilization, the pain persisted, and increasing edema necessitated the reapplication

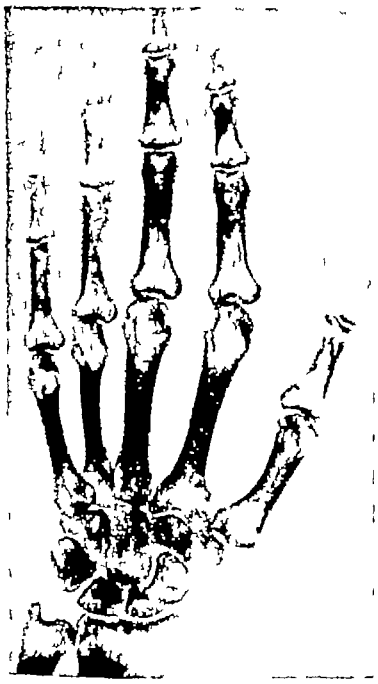

FIG 6 Case 3 L J Radiograph revealing redisposition of calcium.

of a bandage On March 31 1947 three days post trauma, an infusion of procaine was given There was immediate relief of pain Within two days the edema subsided Mobility of the fingers was encouraged and on the tenth post-traumatic day the patient returned to work pain-free Three weeks after the accident he was discharged with no residual defect.

Contusion, Abrasion, and Laceration —The use of intravenous procaine in these cases afforded us the opportunity to perform a rather painless debridement Its use allows for pain free procedures in the repair and dressing of superficial tissues

"Trigger" Finger —We have included this one case in our report to demonstrate the inability of intravenous procaine to overcome the pain initiated and maintained by a *mechanical factor* Three infusions, given during a period of two weeks, produced no change in the patient s condition.

Comment

Most physiologists agree that for the repair of injured tissues the following requirements are necessary adequate amounts of ascorbic acid equilibrium of serum proteins, and normal carbohydrate metabolism However, when a pathologic process develops, signified by vasospasm, capillary dysfunction, and pain, the function of these three factors in the normal process of repair is inhibited Any method, therefore, which *suppresses the development of the symptom-complex* of pain and allows normal healing to take place, is the method of choice

It has been shown that the restoration of the normal circulatory integrity to the extremity depends upon the release of the sympathetic vasoconstricting mechanism [22] This release can be accomplished by the use of intravenous procaine, which, by its analgetic and anticholinergic actions both relieves the pain and releases the vasospasm [22]

In cases of reflex sympathetic dystrophy, restoration of function has been hastened by the use of intravenous procaine Clinical observations lead us to believe that, if this condition is diagnosed in its early stages or is even anticipated, the prompt institution of procaine therapy may well prevent and will certainly reduce, the marked disabilities characteristic of this clinical entity The preventive action of intravenous procaine may be illustrated by the prompt relief of pain, early restoration of function, and early rehabilitation achieved by its use in the two fracture cases presented in this report.

In passing we may note that 30 per cent of all industrial accidents involve injuries to the fingers and hands. Nineteen per cent of all compensation paid is awarded to this group [24] The results obtained by the use of intravenous procaine in the management of selected cases seem to indicate that early rehabilitation and restoration of function can be attained by this method, thus reducing the over-all cost of medical care

Summary and Conclusion

Relief of pain early restoration of function, and early rehabilitation may be achieved by the use of intravenous procaine in the treatment of the injured hand

Discussion

Henry H. Ritter, M.D *New York City* —I feel that I have not seen a sufficient number of cases to make any positive statement as to the value of intravenous procaine *in the treatment of hand injuries.* I can say that we have seen some remarkable results and we have seen some cases in which it has been of no value

Causalgia is a reflex sympathetic dystrophy characterized by sharp burning pain, redness or pallor, swelling, sweating, and often atrophy and demineralization of bone Atrophic changes in the skin and muscles do follow

Often trigger points are present and injection of these trigger points with procaine in mild causalgias does give relief for a very short period of time, but in severe causalgias I have seen no good results from the injections alone Sympathetic blocks or sympathectomies are important adjuvants to trigger-point injection If the sympathetic block gives the patient relief from pain for a while and repeated injections are followed by the same results, then sympathectomy is certainly indicated

We have seen more causalgias in the upper extremity resulting from mild injuries such as bruises or sprains than from fractures The pain in causalgia is aggravated by moving the part, touching of the part, noise, and emotional excitement The pain of causalgia may subside spontaneously

About twenty-five years ago we began doing periarterial sympathectomies for causalgia, and, while at first we were enthusiastic about the results, we soon began to see recurrences For the most part, I believe periarterial sympathectomies are now seldom done, at least in this country

The signs of the value of treatment are relief of pain, either complete or in part, relief of sweating, increased warmth, and sense of well-being

We have seen three cases of definite Sudek's syndrome which was relieved by the intravenous administration of procaine and with radiographic reappearance of normal bone We have been able to dress some severely burned hands and treat such injuries, without general anesthesia, following the intravenous administration of procaine In our first case treated in this way, we were astonished by the complete absence of pain. In subsequent cases we have not had complete absence of pain

I should like to cite one case of an adult, white man, 38 years old, who was injured January 31, 1947, when his left hand was caught in a large gear He sustained a comminuted, transverse fracture of the lower end of the radius, fracture of the styloid process of the ulna, separation of the inferior radio-ulnar joint, fracture of the greater multangular, dislocation at the carpometacarpal articulation of the second and third fingers, and fractures at the bases of the proximal phalanges of the second and third fingers

He was immediately taken to a hospital, in a town not far from New York, where attempts at closed reduction failed On February 3, 1947, he was referred to me An attempt at closed reduction again met with failure We could not reduce the fractures and the dislocations If one was reduced, the other recurred The hand was extremely swollen, and patient was in considerable pain

On February 6, 1947, an open operation was performed, and a good correction of all displacements was obtained On the day following the operation the patient's hand was markedly swollen and cyanotic, the patient complained of a great deal of pain Daily injections of intravenous procaine were begun Immediately after the first injection the color of the fingers was improved, as was motion of the hand Treatment was continued for one week Soon the patient was moving his fingers The color of the hand was improved, and he made a rapid and splendid recovery He was discharged from the hospital on February 27, 1947

This experience was particularly stimulating, as this man's avocation was the piano He is a pianist of no mean ability, and two months after his injury he was again playing the piano, actively moving the part

I have not been able to reduce any fractures with intravenous procaine I do not believe sufficient relaxation can be obtained Further intensive study of the value of intravenous injection of procaine, particularly in hand injuries, is definitely indicated Its value has not been definitely established

STUDY DAYS NEVER END

The busy general practioner should never forget that his days of study and learning are never over The medical schools are again all giving excellent postgraduate courses Don't let any man think he can be a success in his office or hospital if he does not take a few weeks occasionally to bring himself up to date on the work he enjoys —*California Medicine, April, 1948*

INTRAVENOUS ANESTHESIA

PAUL W SEARLES, M D , and ROSE M. LENAHAN, M D , Buffalo, New York
(*From the University of Buffalo, School of Medicine*)

THE ADMINISTRATION of anesthetic drugs intravenously has advanced so far beyond the experimental stage that one might call this "The Era of Intravenous Anesthesia" Certainly with the introduction of pentothal sodium in 1934 by Lundy and Tovell, the intravenous route of administration has steadily gained in popularity and taken its proper place with inhalation and spinal technics [1] Intravenous anesthesia may also be combined satisfactorily with inhalation, spinal, and local agents to produce a more highly desirable type of anesthesia from the surgeons', patients , and anesthesiologists' viewpoint

Disregarding some of the earlier drugs administered intravenously, such as avertin, sodium amytal, ether, and alcohol some of which have a limited use in present-day anesthesia, the essential agents which are to be discussed are pentothal sodium, curare (intocostrin), and d tubocurarine chloride, procaine, and nembutal

Pentothal Sodium

Pentothal sodium is the most widely used intravenous anesthetic at present It can be administered alone for minor procedures of short duration requiring no muscular relaxation Frequently, pentothal sodium is given in the room of the thyrotoxic patient not only to prevent the anxiety of the patient's journey to the operating room but also to avoid knowledge of the impending surgery [2] The ease and speed of induction makes this drug particularly desirable in certain groups of patients, for example, alcoholics, highly nervous individuals, those who fear a mask, and patients who have had previous unpleasant anesthetic experiences It must be remembered that deep or prolonged anesthesia can be obtained only by administering an overdose Therefore, it is wiser to combine pentothal sodium with other anesthetic agents for those cases which require marked relaxation.

Certain dangers, inherent in the use of pentothal sodium, are worthy of consideration Errors, both in the selection of patients as well as in the administration of the pentothal sodium, may lead to the occurrence of a severe anoxia Patients with marked anemia, especially that caused by loss of whole blood, tolerate pentothal sodium poorly because the barbiturates in themselves tend to cause a dilution of the blood as previously reported by one of us (P S) [3] This dilution may further decrease the oxygen-carrying capacity of the blood Likewise respiratory obstruction from any cause can be responsible for the development of anoxia during the administration of this anesthetic agent This respiratory obstruction may be complete or partial and may be caused by improper support of the jaw, laryngospasm, tracheal obstruction, bronchospasm, emphysema, or pulmonary edema. Furthermore sodium pentothal is contraindicated in operations on the head and neck where respiratory obstruction may be caused by an accumulation of mucous secretions in the throat, where a reflex stimulation of the carotid sinus may cause a laryngospasm, or where the airway is actually obstructed in such conditions as Ludwig's angina Even during the actual administration of this intravenous barbiturate, when no respiratory obstruction is present anoxia may be produced by a depression of respiration This oxygen lack may cause a stimulation of respiration, and a false impression may be gained, if respiratory depression alone is taken as a warning sign In addition, anoxia, so produced, may cause an increase in the carbon dioxide of the blood with a subsequent elevation of the blood pressure.

Curare

Curare was first used in anesthesia by Griffith and later by Cullen in combination with cyclopropane [4 5]

The forms of curare which are available on the market are intocostrin and d-tubocurarine chloride D-tubocurarine in contrast to intocostrin is soluble in pentothal sodium and is measured in milligrams For example 3 mg are contained in each cc of d-tubocurarine whereas there are 20 units per cc of intocostrin Curare is not an anesthetic per se since it does not produce analgesia but is primarily a relaxing agent for skeletal muscle its site of action probably being the myoneural junction. [6–8] This action of curare is thought to be accomplished by raising the threshold to any stimuli brought to it

The only actual contraindication to the use of curare is myasthenia gravis but it is not wise to give curare to patients whose respirations are already depressed or impaired by other causes. The most serious hazard in the administration of this agent is the occurrence of anoxia, which may

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York, N w York City Section on Anesthesiology May 20 1942.

be the result of a marked respiratory depression or an overdosage of the drug However, in most instances this respiratory depression with its resultant anoxia may be overcome by instituting "reinforced or controlled respirations" In rare instances, a bronchospasm may occur This is especially true when curare is used with pentothal sodium or cyclopropane which in themselves are prone to produce bronchospasm, especially in allergic or asthmatic individuals Bronchospasm is evidenced by an inability to ventilate the lung adequately, even in spite of "reinforced or controlled respirations" Neo- or prostigmine are theoretically the agents of choice to counteract this spasm, but, in practice, administration of either neo- or prostigmine may only accentuate the condition The treatment of bronchospasm is essentially the providing of a clear airway, institution of artificial respiration, the inhalation of oxygen, and the administration of atropine sulfate intravenously in 0 01 grain dose

It is doubtful whether neo- or prostigmine have any place in the treatment of an overdose from curare This statement is made reservedly, because a simple respiratory depression, uncomplicated by bronchospasm, can be treated with prostigmine However, atropine sulfate should be administered intravenously with the prostigmine to prevent a flood of mucus which might occur from its use It would seem best then to counteract any type of curare-like overdosage with the method outlined in the previous paragraph, i e, artificial respiration, oxygen, and atropine, and thus avoid any possibility of encountering undesirable effects from the prostigmine

The dose of curare is extremely variable However, the most important fact to bear in mind is that only a minimum dose should be administered This amount should be just sufficient to produce relaxation and not apnea Experience has shown that "reinforced or controlled respirations" are more apt to produce anoxia and to ventilate the lungs less adequately than the patient's own respirations

Another reason for avoiding an excess dosage of curare is the possibility of the liberation of histamine in the skin and muscles [9] Also, large amounts of curare may cause a peripheral vascular collapse because of the depressive action on the sympathetic ganglion It should be emphasized that curare is eliminated in twenty to thirty minutes, and, therefore, sufficient time should be allowed to lapse to use up even the smaller doses before subsequent injections are administered

Procaine

The use of novocaine intravenously for relieving pruritus in jaundice cases was first suggested by Lundy [10] While overseas in 1943, one of us (P S), through the efforts of Colonel R M. Tovell, undertook the investigation of the effects of the intravenous administration of procaine and administered 1 Gm of procaine in 1,000 cc of saline solution with no ill effect Subsequently, other workers found intravenous procaine to be useful in burns and other painful conditions The use of intravenous procaine as an anesthetic in itself, as reported by Allen, has not been tried extensively by many anesthesiologists at the present time [11] There is a danger that convulsions, caused either by a sensitivity or an overdosage, may occur This reaction limits its usefulness

Fraser has successfully used a combination of procaine and pentothal sodium [12] His proportions are 1 Gm of pentothal sodium and 1 Gm of procaine added to 1,000 cc of 5 per cent glucose and saline solution He has stated that this combination tends to decrease the irritability of the heart to cyclopropane, reduces the incidence of anuria, and provides postoperative analgesia

Burstein believes that intravenous procaine administered during anesthesia, especially in thoracic operations, diminishes the hyperirritability of the cardiac conducting system and reverts a shifted pacemaker to the sinus node [13]

Anesthetic Drugs in Combinations

Pentothal Sodium, Nitrous Oxide, and Oxygen — The combination of pentothal sodium, nitrous oxide, and oxygen, in cases where no relaxation is required, is one of the most popular methods employed today This method which was used extensively both in England and in this country is proof of its efficiency The vast majority of war wounds were amenable to this combination It is highly recommended as both safe and satisfactory when relaxation is not of prime importance The pentothal sodium serves to maintain a well-oxygenated patient, providing a 50 50 mixture of nitrous oxide and oxygen are administered with it

Pentothal Sodium, Nitrous Oxide, and Ether — One of the most interesting combinations, reported by one of us last year at the 141st Annual Meeting, is the combined use of pentothal sodium, nitrous oxide, and ether Used as the inducing agent, pentothal sodium is also administered during the operation to desensitize the respiratory center and thereby enable the anesthetist to introduce to the patient the desired amount of ether safely and rapidly and at the same time avoid high ether concentrations This method has enabled us to secure rapid relaxation during the operation which has proved most satisfactory to the surgeon There has been a minimum of postoperative anesthetic complications with this combination of pentothal sodium, nitrous oxide,

and ether, and the amount of ether required is less than that required with nitrous oxide, oxygen, and ether alone We have encountered fewer difficulties with this type of anesthesia than any other tried up to this time

Local Block and Pentothal Sodium —Pentothal sodium is extremely useful when performing a painful local block. The sleeping patient has no memory of the performance of the block and, in addition, the antagonistic action of the barbiturate tends to lessen any toxic reaction to the injection of the local anesthetic drug We have found pentothal sodium extremely useful in brain surgery where it has been combined with a regional block. The success of using pentothal for long operations, such as a craniotomy, lies in administering very small doses and in limiting the total dose to 1 to 2 Gm. *for a four to five hour operation* The patient is held in an analgesic state, the only indication for additional doses of pentothal during the operation consists of an actual movement on the part of the patient The air way is patent because the patient's jaw is not completely relaxed, *and, therefore, the patient* maintains his own airway This method is not amenable to the head-down position or if the patient's head is inaccessible to the anesthetist In this latter instance, in addition to the administration of the pentothal sodium, an intratracheal tube, *through which nitrous oxide and oxygen* mixture is administered, is absolutely essential In our experience, ether, even with the addition of an intratracheal tube, results in cerebral edema far more often than with the use of a combination of regional anesthesia and pentothal sodium.

Curare and Nitrous Oxide —The use of large doses of curare 150 to 200 mg , with nitrous oxide and oxygen was first reported by Harroun, Beckert and Hathaway [15] This method introduces a large dose of curare on induction and may lead to severe complications in unskilled hands The use of cyclopropane added in small doses to this combination, as reported by Holaday, provides a slightly deeper plane of anesthesia and tends to decrease the dose of curare [16]

Curare and Cyclopropane.—Curare was first used in combination with cyclopropane as previously mentioned [4 5] This method is employed successfully by many anesthesiologists The cyclopropane provides a light plane of anesthesia which leads to the safe conduct of the anesthetic. We have administered these drugs for many cholecystectomies, choledochostomies, and other major abdominal cases. It has been found that less curare is needed when cyclopropane and oxygen are administered than when nitrous oxide and oxygen are used

Ether and Curare —One-third less dose of curare is required when using ether This fact is mentioned only as a condemnation of the method.

Nembutal and Curare —The combination of nembutal given intravenously with curare to facilitate intubation, as recently reported by Carron, Stoelting and Cullen, revives the use of a longer-acting barbiturate than pentothal [17] Drugs such as nembutal and sodium amytal had been disregarded previously because of the long postoperative sleep following their use To avoid this danger, the dose of nembutal should always be small. *Their method of maintenance* consists of administering nitrous oxide and curare and occasionally pentothal sodium This technic has not had sufficient trial and is certainly open to criticism if a long postoperative depression follows the use of nembutal and curare.

Curare with Spinal Anesthesia —Curare can be used satisfactorily to supplement spinal anesthesia either when relaxation is not complete or when the duration of the operation has outlasted the anesthesia. The dose of curare necessarily should be small, and a word of warning should be interjected to the effect that a general anesthetic, such as pentothal, nitrous oxide, or cyclopropane, should be administered along with the curare so that the patient is not awake or suffering pain.

Pentothal Sodium, Curare, and Nitrous Oxide.— The combination of pentothal sodium, curare, and nitrous oxide is as nearly an ideal combination as any of the methods which employ curare. This method has been more refined by the development of d tubocurarine which has been perfected by Baird [18] Baird and his associates have administered this combination of anesthetics for practically all types of operations In their hands, d-tubocurarine, when mixed with pentothal sodium, produces a more uniform anesthesia than when the two drugs are used separately

Summary

We have tried to evaluate the various common drugs used in intravenous anesthesia and to point out some of the salient features embodied in their administration

With the administration of either pentothal or curare, it must be borne in mind that the occurrence of anoxia is an ever present hazard Avoiding the use of pentothal sodium or curare in conditions leading to respiratory obstruction will prevent to a large degree, the calamity of an asphyxiated patient

Pentothal sodium has proved to be a most valuable intravenous anesthetic agent for induction and, when combined with other agents, can be used advantageously in the maintenance of deeper planes of anesthesia.

Curare, a more recent addition, does relax

skeletal muscle but is still used cautiously by most anesthesiologists The place of curare then rests with a more thorough clinical trial and a sensible evaluation of its usefulness and danger

Procaine, intravenously, has a place in controlling arrythymias and auricular ventricular tachycardias during anesthesia There is some reason to believe that procaine can be used intravenously to improve general anesthesia However, more work is needed to justify this statement

The use of the intravenous route in anesthesia has greatly augmented the speed with which pain relief, unconsciousness, and relaxation can be obtained It must be remembered that no one intravenous agent possesses all the characteristics of the ideal anesthetic Therefore, many combinations of anesthetics have been, and are being, used to secure the most suitable type of "balanced anesthesia"

Discussion

Samuel L Lieberman, M D, *Buffalo*—The intravenous route of administration has enabled the anesthetist to bypass the respiratory tract Surgical anesthesia is dependent on the establishment of certain blood concentrations of the various agents Any inadequacy of the respiratory tract thereby produces a barrier between the inhalation anesthetic and the patient's blood stream Breath-holding, laryngospasm, or inadequate ventilation due to excess morphine are common problems which produce this respiratory barrier between the gas machine and the patient's blood stream Often when one uses cyclopropane, anesthetic concentrations in the blood stream can be achieved and maintained only by controlled respirations Thus, the more direct intravenous route for drug administration is preferable

The various combinations just analyzed by Dr Searles indicate that today any one agent is but a part of a total anesthetic When used in combinations, one agent cannot only make up for the deficiency of another agent but may also counteract some undesirable effect of this agent Although pentothal bypasses the respiratory tract in its route of administration, its most undesirable effects are manifested in the respiratory system Thus, while this drug is used in more and more patients for a pleasant and rapid induction, one strives to use less and less of it in any one case The anesthetist who wishes his patient to react promptly upon completion of surgery shies away from large doses of pentothal At times even a gram of pentothal will result in prolonged sleep, characteristic of barbiturate poisoning There exists the possibility of respiratory depression, hypoxia, and pulmonary complications A note of warning is in place for the house staff in this situation Morphine and pentothal potentiate the action of each other If morphine is administered to a patient who has received a large dose of pentothal when this patient is showing signs of restlessness in the postoperative ward, this dose of morphine may very well put such a patient back into a deep coma

The second major problem of pentothal anesthesia is that of the hyperactive throat and laryngeal reflexes One must be wary of using this drug in patients presenting evidence of throat and laryngeal irritations, most common being the chain smoker with a throaty voice It is desirable to cocainize these cases as a prophylactic measure, curare must be available to break a laryngospasm, and the endotracheal tube may be needed

The intravenous route is an accepted advance over the inhalation route Greater use of it is dependent on resolving the inadequacies of the agents which are available at present Perhaps future technics will introduce anesthetic agents even closer to their site of action, bypassing not only the lungs but the peripheral vascular system as well

STREPTOMYCIN SENSITIVITY

Rubber gloves should be worn when handling streptomycin or the syringes and needles used Dr Solomon M. Rauchwerger and associates of the Veterans Administration Hospital at Oteen, North Carolina, report that six nurses had erythema followed by pruritus and papulovesicular eruptions after administering the drug to patients In two cases skin was denuded over the tips of thumbs and index fingers, probably from the syringes and needles used for streptomycin injections Intradermal tests may be advisable for determining sensitivities of persons who work with the drug When 100 units of the drug were administered intradermally to each of 97 members of the nursing staff, seven had positive reactions—*Modern Medicine, June 15, 1948*

PULMONARY PATHOLOGY AS RELATED TO INFANT RESUSCITATION

W Schwab M.D *H D Eastman, M D , and B Etsten, M D , Albany, New York

(From the Department of Anesthesiology and Pediatrics Albany Hospital and Albany Medical College)

THE INITIATION and maintenance of respiration in the apneic newborn infant has been of profound interest not only to the obstetrician and pediatrician but also to the anesthesiologist because of his intimate concern with respiratory problems Numerous resuscitative methods have been advocated Most of these were originally based on clinical experience but have come to be evaluated more upon a physiologic and pathologic basis

According to the statistics of the birth registry, about 80,000 infants die annually at birth in this country, and 30,000 more die in the first day from causes which are mostly of natal origin [1] The principal causes of infant mortality during the first twenty four hours are prematurity cerebral hemorrhage and asphyxia The cause of asphyxia as reviewed by Russ and Strong is clearly classified as follows (1) various forms of toxemia of pregnancy, (2) prematurity, (3) prepartal analgesia, (4) postpartal anesthesia, (5) type of delivery, and (6) type of labor [2]

Many newborn infants have abnormalities and pathologic conditions which do not give clinical findings. Davis and Stevens in a radiographic study found that 55 per cent of newborn babies show some abnormality, 26 per cent of the group showing abnormalities of the lungs, including spontaneous pneumothorax increased hilar densities Increased peribronchial markings and ateleotasis [3]

The purpose of this paper is to investigate by means of the roentgenogram the status of the thoracic cage and its contents in the newborn, before pulmonary aeration and the changes that take place during resuscitative measures and after the establishment of voluntary respiration.

Method

All x rays of the newborn babies were taken in the delivery room, utilizing standardization of technic. The investigation in no way interfered with the form of anesthesia or obstetric delivery Attempt was made to take roentgenograms of the newborn infants under conditions that ordinarily prevailed in any series of cases on the obstetric service Prepartal analgesia consisted of demerol 50 to 100 mg and scopolamine $^1/_{100}$ to $^1/_{200}$ grain when the cervix was 4 to 6 cm dilated The time of premedication to delivery varied from one-half to eleven hours Prepartal anesthesia was open drop ether, and the majority of these cases were lightly anesthetized The average length of time of anesthesia was twenty-five minutes The equipment consisted of a heliosphere portable x-ray, 14 by 17 inch cassettes and an accessory table of the same height as the standard one used by the obstetrician The exposure time of $^1/_4$ second the voltage of 60 kilovolts, and the distance of 30 inches from x ray table to baby were constant throughout the entire series

A 14 by 17 inch cassette was placed at one corner of the obstetrician's table under the sterile drapes One half of the cassette was covered by a lead plate Immediately after birth the obstetrician, without taking time to ligate the umbilical cord, placed the baby in the anteroposterior position upon the sterile covered, exposed portion of the cassette Roentgenograms were taken in the following order immediately at the time of birth, after initiation of respiration, one hour after active respiratory effort, and the last one five days later In some instances, roentgenograms were taken during the various phases of artificial resuscitation. The initiation of respiration in any baby was not delayed to take the roentgenograms

Results

A total of 33 newborn babies were investigated Twenty three did not need any resuscitative measures Ten required resuscitation and of this number seven received gentle external stimulation two mouth-to-mouth inflation and one mouth to endotracheal tube inflation.

A total of 109 roentgenograms were obtained Twenty-one were taken of babies before they started to breathe, and they all had similiar and typical roentgenographic characteristics The x ray negatives show that the ribs form an acute angle with the spinal column and the intercostal spaces are narrow The x ray density throughout the thoracic area is uniform, and there is no delineation of the intrathoracic structures The thoracic cage is constricted superiorly and flares out inferiorly to a relatively enlarged abdomen These features give the appearance of a 'funnel shaped contour' of the thoracic cage (Fig 1)

Roentgenograms of twelve newborns were ob-

By invitation.

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City Section on Anesthesiology May 20 1948.

FIG 1 Contour of the thoracic cage of the newborn before the onset of respiration

tained after the initial respiratory effort (Fig 2) These x-rays show varying degrees of expansion of the lung fields The lateral borders of the lungs are the first portions to be aerated The roentgenographic clarity of outline of the intrathoracic structures parallels the amount of air inspired and the degree of aeration

All the roentgenograms of the babies that were taken after active breathing show striking changes of the chest in contrast to those taken before the initiation of respiration (Fig 3) At this time it can be seen that the thoracic cage appears larger in all dimensions and loses its preventilatory "funnel shape" The structures of the chest and mediastinal contents are clearly defined Air is present in the gastrointestinal tract, and the amount is in direct proportion to the degree of respiratory effort and active crying of the newborn Subsequent roentgenograms taken one and five days after birth show no demonstrable changes in the lung fields as compared with those that were taken immediately after active respiration on the day of birth The only difference in this group is the increased amount of air throughout the gastrointestinal tract

The cases described below are offered to demonstrate the following (1) atelectasis of the newborn, resuscitation by mouth to endotracheal tube insufflation, and the recurrence of partial atelectasis although the baby gave the impression of complete expansion of the lungs, (2) bilateral

FIG 2 X-ray negative of newborn baby immediately after making one respiratory effort. Note slight aeration of the lung field and maintenance of the "funnel-shaped" thoracic cage

atelectasis of the premature baby with a pneumothorax on the right side, onset of clinical symptoms appearing four hours after delivery, and (3) clinical impression of marked respiratory obstruction in a newborn one hour after birth with negative roentgenograms of the chest and a patent tracheobronchial tree

Case Reports

Case 1—A full-term baby delivered via perineal route, who made no respiratory effort after birth, was resuscitated by the introduction of an endotracheal tube and endotracheal suction with gentle mouth-to-tube inflations Spontaneous respirations occurred within twenty minutes of resuscitation The patient then presented a clinical picture of normal respiratory effort The first x-rays, taken immediately after birth, indicated no pathology (Fig 4) The roentgenograms taken during mouth to endotracheal tube insufflation reveal bilateral massive atelectasis (Fig 5) After adequate endotracheal suction and continuous insufflation for twenty minutes, the baby made voluntary respiratory efforts The clinical impression at that time was that both lungs were fully expanded Another roentgenogram was taken, and it shows that the right upper

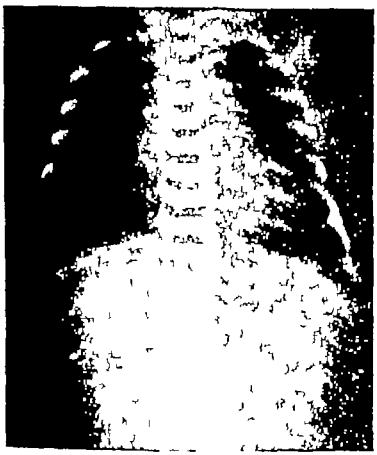

FIG 3. Typical roentgenogram of the marked change in chest cage following active breathing by the newborn baby Note increase in diameter of the apex and the complete aeration of the lungs. Photograph was taken six minutes after birth, and air was now evident in the stomach.

lobe remained collapsed. The infant was intubated and the lungs reinflated by insufflation for the second time (Fig. 6) Subsequent x rays demonstrate that

FIG 4. Initial x-ray of Case 1

FIG 5 Roentgenogram of Case 1 taken during resuscitation.

the atelectatic lobe did not fully re-expand until about seven hours after the second resuscitative attempt and only then four hours after the baby initiated vigorous crying

Case 2.—Four hours after delivery by cesarean section a premature infant of seven and a half months gestation which breathed and cried sponta

FIG 6 Return of atelectasis in right upper lobe, even after active endotracheal suction and inflation.

Fig 7 X-ray of a premature baby revealing a pneumothorax on the right side and bilateral massive atelectasis

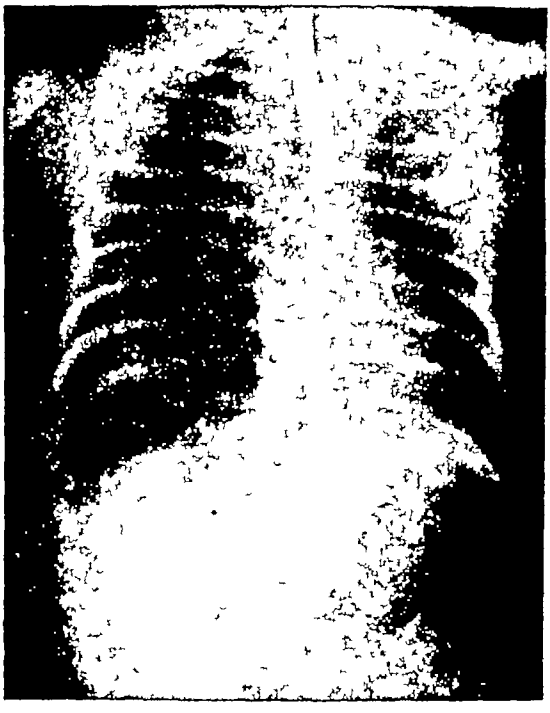

Fig 8 This photograph shows that inflation of the lungs was impossible in this case

neously after birth, presented the clinical picture of central depression There were intermittent periods of apnea followed by repressed tidal exchange Although this baby was not resuscitated, a roentgenogram revealed bilateral massive atelectasis with a pneumothorax on the right side (Fig 7) The baby expired twenty-four hours after birth, immediately after its death an endotracheal tube was introduced, and oxygen was administered by positive pressure for the purpose of seeing the degree of expansion of the chest wall and the questionable degree of expansion of the lungs Although the thoracic cage fully expanded during this measure, the roentgenogram showed that there was a slight amount of air only in the upper left lobe, and there was no change in the upper lobe and the pneumothorax At postmortem examination both lungs were found to be liver-like in appearance and showed the fetal type of atelectasis (Figs 8 and 9)

Case 3 —This full-term baby demonstrated clinical symptoms of marked respiratory obstruction one hour after birth Roentgenograms of the chest presented no evidence of tracheal compression or of pulmonary pathology The baby was placed in an oxygen tent, and during the subsequent ten days the clinical symptoms gradually disappeared

Comment

The contour of the thoracic cage of the newborn infant before it makes respiratory efforts is funnel-shaped in appearance as shown in Fig 1 The greatest degree of expansion occurs in the upper portion of the chest cage after the baby breathes (Fig 2) Pathologic thoracic entities cannot be revealed by a roentgenogram taken at this time of life before the initiation of respiration Air enters the stomach immediately after the onset of breathing, and the amount of air in the entire gastrointestinal tract is in direct proportion to the amount of crying and the degree of respiratory exchange made by the baby In those newborn infants, where the breathing is depressed

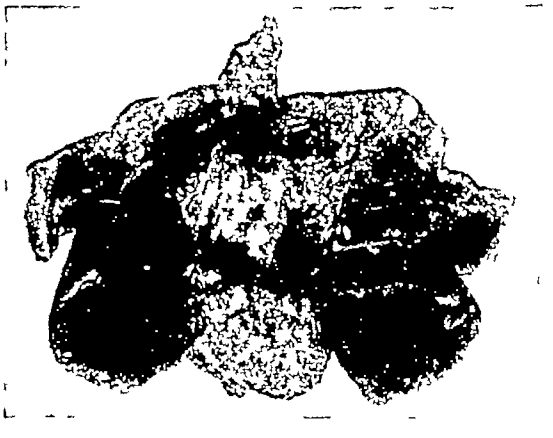

Fig 9 Gross pathologic specimen of Case 2 demonstrating an emphysematous bleb in the left upper lobe, mediastinal emphysema, and solid, neonatal lung tissue

very little air is visible in the gastrointestinal tract.

Evidence is produced to show that the degree of expansion of the chest wall during artificial resuscitation is no indication of the degree of expansion of the lung. This factor is of vital importance when considering the technic of resuscitation by endotracheal tube plus insufflation or positive pressure. In those cases that have a fetal type of atelectasis, gentle prolonged insufflation is a safer method than direct application of positive pressure. By insufflation the individual resuscitator can determine the degree at the time when the slightest amount of resistance is experienced irrespective of the extent of thoracic expansion. Numerous writers have designated definite degrees of positive pressure that are within safety limits, but this procedure should not apply to the cases of atelectasis in the premature baby, because the lungs have not fully developed and may rupture.[4-6]

The differentiation between asphyxia pallida and asphyxia livida should be made before attempting artificial respiratory efforts by any method. In those cases which present the picture of asphyxia pallida, the method of 'mouth-to-mouth insufflation may be quite ineffective because of the atonic pharyngeal and laryngeal musculature. In these instances, most of the insufflated air would enter the gastrointestinal tract rather than the pulmonary bed. It would be advisable therefore, to introduce an endotracheal tube and thus inflate the lungs directly.

Careful clinical diagnosis of respiratory abnormalities can be found to be inaccurate according to roentgenographic evidence. Active resuscitative measures in those cases that have no pulmonary pathology can often produce more damage than good. Spontaneous pneumothorax can be present during the newborn period this condition occurring even in those cases that did not have any form of resuscitative measures. However, if the respiratory effort of the newborn with a spontaneous pneumothorax need be augmented, it is important first to obviate the pneumothorax.

Atelectasis of the full term baby can be actively treated by endotracheal suction and insufflation. In many instances the atelectasis will be alleviated for a short period of time but can recur and will clear up after active crying.

Conclusions

1. Roentgenographic studies demonstrate the changes in the thoracic cage before and after the onset of respiratory effort of the newborn.
2. Spontaneous pneumothorax can occur during the newborn period.
3. The degree of expansion of the chest wall during artificial resuscitation of the fetus does not indicate the extent of pulmonary inflation.
4. This study reveals the value of roentgenograms of the newborn baby having respiratory difficulties.

Discussion

H. D. Eastman, M.D., *Albany*.—To me, the most striking feature of this paper is the rapid and roentgenographically complete aeration of the lungs with a hearty cry and its associated deep breathing. The report of Wasson, referred to in the paper appears to emphasize a time element with complete aeration in some cases within five minutes and in others, particularly in those babies with prolonged difficult delivery, within from five minutes to two weeks. Seemingly, the phenomenon may occur promptly and depends directly on the activity of the baby and indirectly on other factors only in so far as they affect this activity. It is not to be denied that small atelectatic areas may persist microscopically *in the lung for one or two weeks after birth without* being demonstrable on roentgenograms.

The typical shape of the newborn chest demonstrated by x-rays taken before initiation of respiration may be observed on gross physical examination particularly in babies with little subcutaneous tissue. Close clinical observation of the change in shape of the thoracic cage with breathing gives information relative to the probable aeration of the lungs.

Apparent respiratory distress certainly does not necessarily mean pulmonary pathology. In the newborn period, this symptom should always suggest as well the possibility of intracranial injury. X-ray of the chest is a necessity in distinguishing pulmonary from nonpulmonary entities.

The first requisite in resuscitation of the apneic newborn is the establishment and maintenance of a free airway. External stimulation may then be tried. The major point to be emphasized with such stimulation is gentleness; the risk of causing visceral trauma, increased shock and cerebral hemorrhage is very real. Oxygen is to be administered and warmth maintained. Utilization of technics of artificial respiration such as endotracheal intubation and insufflation requires a considerable amount of training and a high degree of practical skill. Considering the ease with which the newborn's tissues may be traumatized and the respiratory distress increased rather than relieved, such technic should be performed only with great care and gentleness despite the urgency of the situation.

The methods and the results of artificial respiration in atelectasis in prematurity vary from those in atelectasis in a full-term newborn. The small amount of oxygen absorbed through the walls of the trachea and larger bronchial radicals may sustain a baby's life for a relatively short period in some cases, but without alveolar aeration, death invariably results. Without immediate availability of x-ray facilities, as is the case in many hospitals, the efficiency of resuscitation must be evaluated in the light of clinical response. The apparent evidences of ade-

quate oxygenation and the maintenance of respiratory activity by the baby without external aid are the guides

We have found that the best results parallel the cooperation and coordination of the obstetric, pediatric, and anesthesiology departments Coordinated training and standardization of technics of resuscitation are prime requirements in the successful handling of respiratory difficulties in the newborn

We wish to acknowledge the support of this investigation by the Winthrop Research Fund

WAY FOUND TO LESSEN EAR DAMAGE FROM STREPTOMYCIN

Inner ear damage that sometimes is caused by streptomycin treatment might be prevented by desensitization, two Columbia University ear researchers reported at the meeting of the National Tuberculosis Association in New York They are Dr Edmund P Fowler, Jr , and Carl R Feind

Since tuberculosis patients getting streptomycin treatment must take the drug for weeks or months, the dizziness and other symptoms from its toxic effects on the inner ear may be troublesome Some patients are extremely susceptible, others very resistant to this effect of the drug In rare cases the hearing mechanism is also affected, but this is often reversible

In experiments with cats and salamanders, Dr Fowler and Mr Feind found that the toxic effect of streptomycin on the vestibular system of the inner ear can be modified by desensitizing the animals before giving a toxic dose —*Science News Letter, June 26, 1948*

HOUSE DUST MAY CAUSE INFANTILE ECZEMA

The possibility that house dust is an important cause of atopic dermatitis, or infantile eczema, was advanced by Jerome Glaser, M D , of Rochester, in a recent issue of the *Journal of the American Medical Association*

Infantile eczema is an allergy disease which, it is believed, is caused by direct contact of the skin with certain allergens, as well as by allergens which have been inhaled and which reach the skin through the blood stream An allergen is any substance which is capable of inducing allergy or specific susceptibility

Among the characteristics of atopic dermatitis are watery sores, scales and crusts, and itching or burning sensations The affliction is commoner in infants and children because their tender skins are more easily penetrated by allergens than those of adults

According to Dr Glaser, "the characteristic distribution of atopic dermatitis, with lesions worse on the face, the area of the arms below the elbows, and the area of the legs below the knees, suggests a possible contact origin" In view of this, he said, "it is tempting to consider that such lesions might be caused by a ubiquitous and powerful allergen, house dust, which could act either by contact or inhalation"

As further evidence of the importance of house dust in causing infantile eczema, Dr Glaser pointed out that "the often remarkably beneficial results of hospitalization are commonly attributed to avoidance of house dust as well as of other environmental allergens," adding that good results in the alleviation of the condition have also been attained by treating patients with injections of house dust extract

According to the article, there is no completely satisfactory treatment of infantile eczema and, therefore, "the problem is to do the best one can with a disease which is usually self-limited, with a tendency to spontaneous remissions and eventual recovery regardless of therapy"

Prophylactic, or preventive measures, such as avoidance of dust or irritating wool clothing, are considered important in the orthodox treatment of the disease Special baths, prepared by adding a cup or two of cornstarch to a tub of tepid water, are also recommended for early stages of the disease

The local application of paste of resorcinol, made up of one part zinc oxide, one part corn or arrowroot starch, and two parts white petrolatum, is highly satisfactory in more advanced or chronic stages In all cases of atopic dermatitis, the article says, it is well to put the patient on a simple elimination diet, which includes substitutes for cow's milk and the administration of vitamins A, D, and C

ESOPHAGEAL INTUBATION FOR REPAIR OF PHARYNGO ESOPHAGEAL DIVERTICULUM

RICHARD N TERRY M D , Buffalo, New York

(From the Buffalo General Hospital)

PHARYNGO-ESOPHAGEAL diverticula, constituting about 98 per cent of all diverticula associated with the esophagus, are known to originate quite consistently at the same location [1-3] Specifically, the herniation occurs at a weak point in the posterior wall (pharyngeal dimple) at the juncture of the inferior constrictor and cricopharyngeus muscles.

Etiologically, the sac is presumed to form as a result of muscular incoordination Constrictors of the pharynx attempt to pass food by a spastic upper esophagus, with the result that the mucous membrane knuckles out posteriorly at the weak point between the two above-mentioned muscles Eventually weight of food in the sac causes it to angulate downward, displacing the esophagus to the left (most commonly) and placing the diverticulum opening directly in the path of the swallowed food

Repair of esophageal diverticuli is an exacting surgical procedure, made more difficult for the surgeon by the relative infrequency of the lesion Any maneuver which will identify the offending sac readily is apt not only to shorten the procedure but also to add to its safety Once the esophageal defect is located, a further complication arises from the fact that the enormously elastic esophageal wall, irregularly plicated in its relaxed state, offers little suggestion as to its disposition when distended It is obviously desirable to provide some means of distending the esophagus during repair Moreover, Shallow and Clerf point out the desirability of maintaining the pharynx and upper esophagus in their anatomic position during ligation of the sac neck and transplantation of the stump [4] To achieve this end they prefer to keep an esophagoscope in the esophagus during the entire period of repair

The anesthesiologist, employing familiar techniques is able to provide the means for identifying the sac, as well as for anchoring and distending the esophagus without the intervention of a third party, the endoscopist

As far back as 1900, Kocher and J S Mixter observed the constant displacement of the esophagus produced by a growing diverticulum, noting that a tube in the pharynx directed anteriorly and to the right would bypass the diverticulum and enter the slitlike esophageal orifice [5] Likewise, when the tube was directed posteriorly and to the left, it would enter the diverticulum As a matter of practical importance, so large is the diverticular orifice that any tube directed into the lower pharynx will find its way into the diverticulum, whereas, usually, it is only with great difficulty that a tube may be induced to enter the esophagus itself

Following the suggestion of Dr J Sutton Regan, of Buffalo, New York, these principles were employed in intubating the diverticula and esophagi of the two patients described

Technic

Anesthesia was induced with a minimal quantity of pentothal, followed by curare in amount sufficient for easy exposure of the glottis. Under direct vision, the esophageal diverticulum, whose orifice is in continuity with the lower pharynx, was thoroughly aspirated of food content to minimize the likelihood of aspiration as well as to simplify surgical removal Cocaine in 10 per cent concentration was then sprayed liberally over the pharynx and glottis (The Macintosh blade provides the widest angle of vision.) A small light on a flexible shaft (Cameron) was then placed in the diverticulum by directing it along the posterior wall of the pharynx until gentle resistance was met. Lastly, the trachea was intubated and the patient was then ready for draping Glottic intubation is reserved until last, since the tracheal tube would obscure the hypopharynx from the best view of the sac orifice In one of the patients, a retching movement during laryngoscopy caused the hypopharyngeal sphincter to open widely, presenting a full view of both the sac and the true orifice of the esophagus.

When the surgery has progressed to the point where the superficial fascia has been opened, exposing the structures of the neck, the light (previously placed) is turned on, brilliantly illuminating the diverticulum. The surgeon then proceeds to free the sac throughout its extent However, before the diverticulum is cut from its parent structure the light is withdrawn and the esophagus blindly intubated by directing a large Magill tube anteriorly and to the right down the pharynx. At this point the surgeon is in an advantageous position to facilitate the traversing of the small, slitlike esophageal orifice by gentle

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York New York City Section on Anesthesiology May 19 1948.

manipulation of the now delineated structures The tube need be passed only three or four inches beyond the orifice to anchor these structures for maintenance of their anatomic position, a factor of major importance in accurate repair according to Shallow and Clerf [4]

Obviously, the greatest care must be exercised to anchor the tube against loss into the stomach, since recovery would constitute a major procedure

Discussion

Several factors are to be considered specifically in the management of anesthesia for esophageal diverticula (1) danger of aspiration of diverticulum content, (2) trauma to recurrent laryngeal nerves, and (3) facilitation of sac identification for the surgeon

Regional block anesthesia (advocated by Harrington and formerly by Lahey) fulfills all three requirements in that (1) swallowing reflex is maintained to guard against aspiration, (2) talking during the dissection offers information as to the state of the laryngeal nerves, and (3) the patient is usually able to fill the diverticulum with air by swallowing, and thus aid in its identification [1 5] However, Lahey has discontinued regional block anesthesia for this procedure after reporting its use in 118 cases, stating that it is a trying ordeal for the patient and "far from satisfactory even in competent hands" [2]

General anesthesia, with a cuffed tube in place in the trachea, protects against aspiration and, with the technic employed here, assists in location of the diverticular sac Although general anesthesia fails in respect to the third point, offering no protection against laryngeal nerve damage, it must be noted that in one large series (140 cases) operated exclusively under regional block there were six temporary cord paralyses and one permanent paralysis, suggesting that regional anesthesia does not, in itself, guarantee the integrity of the laryngeal nerves [1]

Esophageal Intubation

Knowing that the distensibility of the esophagus permits passage of a food bolus of tremendous size, one may appreciate the difficulties of accurately closing a rent in its wall while the esophagus is in the relaxed state Swallowing in the immediate postoperative period places great stress upon the suture lines As might be expected from these features, the principal complications of this surgery, recurrences, fistula formation, and obstruction result from leakage by an unsatisfactory closure In the series of 140 cases referred to previously, 11 developed temporary fistulas, 10 developed angulation requiring dilatation, and five had recurrences [2] Others observed similar complications, and so frequent is postoperative obstruction that it is recommended that a string be left in the esophagus to aid in dilatation at a later date [3 5] The virtue of esophageal intubation is twofold first, during the actual repair, maintenance of the normal anatomic position of the pharynx and esophagus eliminates the distortion produced by a long-present, large diverticulum, second, in distending the esophagus itself, suture lines may be placed in the tissues corresponding to the disposition taken by the esophagus during swallowing, thus reducing the likelihood of stress during immediate postoperative swallowing By esophageal intubation, it is hoped that the chief cause for postoperative complications, i e , unsatisfactory apposition of edges of the sac neck, can be largely eliminated

Summary

Employing familiar technics, the anesthesiologist is able to assist the surgeon in the repair of pharyngo-esophageal diverticula by providing positive identification of the diverticulum sac and by anchoring and distending the esophagus during coaptation of cut edges, permitting more anatomic closure, and, it is hoped, thereby reducing postoperative complications

AVITAMINOSIS B AFFECTS LIVER

Chronic deficiency of vitamin B complex may produce liver injury unless supplemented by a high-protein diet Doctors Victor A. Drill and Ted A Loomis of Yale University, New Haven, Connecticut, observe that dogs deprived of vitamin B complex and given a usual 20 per cent casein diet develop functional and histologic hepatic changes within twenty-seven weeks When 41 per cent casein is given such changes do not occur even after fifty weeks —*Modern Medicine, June 15, 1948*

STUDIES ON THE PHARMACOLOGIC PROPERTIES OF PROCAINE AND DI-ETHYL AMINO ETHANOL

E M Papper, M.D , Bernard B Brodie, Ph.D , Philip A Lief, M D , and E A Rovenstine M D , New York City

(From the Departments of Anesthesia and Biochemistry New York University College of Medicine)

EXTENSIVE clinical usage has established the importance of procaine as the basic standard in the field of local and regional anesthesia In recent years this agent, injected intravenously, has been used in the therapy of a wide variety of painful disorders and other alterations of normal function in man, among them the disorders of cardiac rhythm observed during surgical anesthesia.[1-4] Despite the rapid accumulation of clinical experience with intravenous procaine fundamental knowledge concerning mechanisms of action, the distribution of the drug in the body and the precise mode of destruction or elimination has not been available. Furthermore, the necessity of withholding adequate quantities required for the desired therapeutic effect has been imposed upon the clinician by some of the unfavorable toxic properties of procaine

For these reasons, Brodie and his collaborators undertook a systematic study of the pharmacology of procaine with the aid of specially devised chemical methods for the identification of the parent material and the products of its hydrolysis, di-ethyl-amino-ethanol and para-amino-benzoic acid [5] In addition to establishing the manner of disposition of procaine in vivo it was desirable to determine whether the observed toxic effects were associated with procaine itself or with some product of its normal degradation It was entirely possible on the other hand, that the therapeutic action of procaine was exerted by a metabolite which was less toxic than the parent drug or if this were not the case that procaine itself could be altered by chemical substitution in the molecule to make it a more stable and effective drug

In studies upon normal man Brodie and his coworkers demonstrated that procaine is rapidly hydrolyzed to di-ethyl-amino-ethanol and para-amino-benzoic acid after intravenous administration [6] They found, further that urinary excretion is almost negligible as a method of disposition of the injected procaine Since 70 to 95 per cent of the para-amino-benzoic acid (free and conjugated) in procaine is recovered in the urine it was apparent that this material was largely unaltered in the body On the other hand amounts of di-ethyl-amino-ethanol equivalent to 20 to 35 per cent of the original procaine can be isolated from the urine When para amino-benzoic acid and di-ethyl-amino-ethanol are injected as such, quantitative recovery in the urine is identical with that described when these substances are administered in the esterified form as procaine It is evident therefore that the di-ethyl-amino-ethanol product of the hydrolysis of procaine is further metabolized in vivo in a manner as yet undetermined

The fact that the concentration of procaine in the plasma does not increase with continuous intravenous administration while that of the alcohol does, as clinical effects are noted suggests that the latter may be the pharmacologically active agent rather than the parent drug The role of para-amino-benzoic acid has not been completely investigated but the previously known behavior of this substance offers little support for the possibility that it exerts many of the actions commonly attributed to procaine Burstein *et al* suggested its possible efficacy in the prophylaxis against cyclopropane-epinephrine arrhythmias in the dog [7] No other studies are as yet available

It seemed desirable therefore to investigate the pharmacologic effects of di-ethyl-amino-ethanol upon man and laboratory animals. Observations early in the course of these studies indicated that the toxic effects were qualitatively similar to procaine, but large doses could be given intravenously before these were apparent. The margin of safety was significantly greater than with procaine The relative lack of toxicity of this material and its greater flexibility with regard to route of administration pointed the way to a comparison with the orthodox actions of procaine Comparisons were directed toward the properties which have been reported for procaine.

Procaine and many other tertiary nitrogenous compounds have several pharmacologic actions in common

Local Anesthesia —Procaine represents the basic example of the type of drug which produces anesthesia in tissues into which it is directly injected Appropriate anesthesia is obtained readily upon deposition about a nerve trunk Di ethyl-amino-ethanol appears to mimic procaine in this respect but is considerably less efficient in the production of significant local anesthesia

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York New York City Section on Anesthesiology May 10 1948.

far more effective clinical applications This preliminary report has given only the briefest indication of what has now become the expected attitude toward the pharmacologic investigation of a new drug It is virtually a new pharmacology with newer, more exacting and extensive criteria It is worthwhile to call attention to this, inasmuch as Dr Shannon and Dr Brodie have been leaders in developing these criteria

Of the evidence that has been mentioned, the possible role of di-ethyl-amino-ethanol as the effective ingredient of procaine certainly warrants a systematic study of its activity It is yet too soon, from the data presented here, to evaluate its use in cardiac arrythmias, vascular spasm, or painful states We hope that by the next annual meeting the authors will be able to report detailed results of the work of the group

One other factor the speaker mentioned deserves comment It is the second handicap in the study of procaine or any analgesic drug This is the existing weakness in our ability to define and study pain experimentally and quantitatively Most of us have long experienced the vagaries of pain syndromes via our use of therapeutic nerve block Clinical pains virtually defy experimental reproduction, particularly in laboratory animals Seemingly, human subjects with pain, either spontaneous or experimental, vary in their responses as widely as they vary in looks, personality, and mental make-up, making such studies infinitely more complex than the orthodox concept of pain threshold alteration apparently allows

DOCTORS SAY BONE BANK HAS GREAT POSSIBILITIES

Bone preserved in a frozen state for weeks is of "definite value" in bone-grafting operations, Dr Leonard F Bush, Danville, Pennsylvania, and Dr C Zent Garber, New York, reported in the June 12 issue of the *Journal of the American Medical Association*

In an article entitled "The Bone Bank," the two doctors said that "if foods, serums, and other perishable substances could be kept in a low temperature freezing cabinet, we decided that perhaps this method could be used to preserve bone so that a constant supply would be available at all times" Experiments were undertaken, and it was found that human bone can be preserved, apparently indefinitely, in a freezer at minus 20 to 30 C

"Spinal fusions for scoliosis (abnormal curvature of the backbone) and disorders in the lower part of the back, the filling of large bone cysts, and the replacement of defects in bone are a few of the common problems in which large quantities of bone are necessary," the doctors stated in their article

In their experiments large chinchilla rabbits were used Control studies were made Thirty-two bone transplantations were made by 28 operations on 19 animals There were no casualties, and in only one wound was there a superficial infection

The experimental bone-grafting studies on rabbits showed that freezing at low temperature is a safe method of prolonged preservation of bone for grafting purposes Bone grafts three to six weeks after implantation proved successful Some of the bone used had been frozen from twenty-eight to eighty-four days

"Having proved that this method of preserving bone was successful in animals, we felt it was safe to attempt it in man," the article said "Thus all available clean fresh bone was placed in bottles and frozen at minus 25 C Because infection developed in one case, the bone is now kept for two weeks before using, while the donor remains under observation for evidence of developing wound infection" The doctors explained that by "exercise of diligence," considerable bone may be accumulated from many sources

In discussing the clinical results, the doctors stated that homogenous (having a similarity of structure) bone has been used in 126 operations in 104 patients "Of these, 24 operations were by direct transfer, refrigeration at plus 2 to 5 C was used in 37 instances, and the bone was stored in a deep freezer for 43 operations"

In the 104 cases in which donor bone was used, there were only four complications "The donor bone furnished a framework for the formation of new bone by substitution and by furnishing the necessary calcium for this new bone," the article stated

In discussing the paper, Dr J R Cobb says that from his experience at the Hospital for Special Surgery in New York, bone can be preserved indefinitely if it is kept sealed at a sufficiently low constant temperature without contamination

THE HISTORY OF INTERCOSTAL MUSCULAR PARALYSIS AS A PHENOMENON OF ANESTHESIA

GEORGE EDGAR BURFORD M D , New York City

(From the Departments of Anesthesiology, St. Luke's and Woman's Hospitals)

DURING deepening anesthesia respiration undergoes progressive deterioration In the human this regressive process is readily observed and serves as a guide during the administration of anesthesia.

In the first place the activity of the intercostal muscles becomes impaired In the supine position the anterior chest wall fails to become elevated at the instant the diaphragm contracts This is due chiefly to impairment in the efficiency of the contraction of the intercostal muscles Later, the elevation expansion of the anterior chest wall occurs only during the latter part of the diaphragmatic contraction Second, the chest wall fails to rise at all and later actually sinks This happens because the diaphragm working unopposed by the inactivated intercostal and certain accessory inspiratory muscles, indirectly pulls the upper anterior chest wall down while contracting

In the third place, as respiratory impairment progresses, the diaphragm itself falters The contraction becomes of shorter duration and assumes a jerky gasping character which later becomes ineffectual for ventilating the lungs The jerky descent of the diaphragm pushes the contents of the abdominal cavity against the anterior abdominal wall The wall is thrust upward with each corresponding contraction of the diaphragm The term abdominal respiration is used to describe this phase of respiratory activity during deep anesthesia

Finally, with respiration now greatly impaired primitive accessory respiratory muscles although no longer effective, become activated In general these are muscles developed embryologically from branchiomeres and associated in phylogeny with the development of the mouth and the related intestinal tract and lungs. The mylohyoid and anterior belly of the digastric serve as examples These muscles have an accessory function *of opening the mouth, which accounts for* their association with respiration

At this stage of anesthesia, occasionally at a much lighter plane resumption of activity in the mylohyoid produces a funnelling or trough-forming movement in the tongue and floor of the mouth in rhythm with each inspiratory discharge This movement can be directly observed or felt by the hand placed below the chin. Further increase in depth of anesthesia is soon followed by complete respiratory failure.

In 1925 Dr Albert Miller independently discovered and discussed paralysis developing in the intercostal muscles during deepening anesthesia [1] The importance of his observations was immediately grasped by Waters, Guedel, and others who were active in teaching anesthesia at the time As a result of work done chiefly by these three, intercostal paralysis as described by Miller became the constant guide to the commonly used levels of surgical anesthesia

The importance of Miller's observations should not be minimized He uncovered and made available for immediate useful application what was probably the most fundamental single observation in the teaching and understanding of anesthesiology Yet to attribute the discovery of intercostal paralysis to Miller in the year 1925, as is quite regularly done, is incorrect Moreover, it is interesting to note that isolated observations on this matter were made by several physicians including the first medical specialist in anesthesia, John Snow

Snow took up the study of anesthetics immediately after their introduction into England early *in 1847 After much observation, experimenta*tion and appraisal, in 1858 he published his famous book, "On Chloroform and Other Anesthetics [2] Snow judging by the wealth of original information on anesthesia recorded in this book, was an astute observer His facts were the more remarkable because there were no other books and few scientific papers on anesthesia at the time

On page 42 this statement appeared "There are some further effects of chloroform with which one becomes acquainted in experiments on lower animals If inhalation is continued after the *symptoms just described* (stertorous breathing, dilated pupils, relaxed muscles) are produced the breathing is rendered difficult feeble or irregular and is sometimes performed only by the diaphragm *whilst the intercostal muscles are paralysed*'

Again on page 90, Snow remarked that the administration of too much chloroform to humans resulted in quieting other respiratory muscles leaving the diaphragm to act alone muscular

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City Section on Anesthesiology May 20 1948

tone failed to fix the chest wall against the activity of the diaphragm, and, consequently, "abdominal respiration" developed At this point he did not specifically mention the intercostal muscles

Snow failed to interpret the value of his observation properly, a matter which was quite understandable He was exploring a new area wherein the most obvious happenings lacked an explanation The establishment of anesthesia required of the administrator, and undoubtedly of the patient, the ability to surmount a series of recurring and sometimes terrifying crises These major matters pre-empted the attention of the early administrators The nuances of respiratory activity, however fundamental to a proper understanding of anesthesia, had to await a later date for adequate emphasis

Paul Bert was the next to make relevant observations on this subject Bert was one of the great early respiratory physiologists and the successor to Claude Bernard in the chair of physiology at the French Academy of Sciences in Paris His book, *La Pression Barometrique*, published in 1879, reported about 600 experiments concerned with altitude physiology This work established Bert as the unchallenged pioneer in that field It is now considered a scientific medical classic Yet sixty years and the emphasis on aviation engendered by a second World War were required to achieve adequate recognition for the author A complete translation into English was made available in 1943 during the period of intense scientific activity in flight physiology

Beside his major interest, Bert conducted many studies in anesthesia, chiefly on animals under laboratory conditions He worked with nitrous oxide at increased atmospheric pressures Later he made studies of the effects on animals of carefully measured anesthetic mixtures of air with chloroform and ether In the middle 1880's he published a series of papers on the latter subject which showed his broad insight into problems related to anesthesia Beyond reporting sound observations on respiration and circulation, these papers showed concern with matters that have only recently come under intensive study by the anesthesiologist These interests of Bert included the effect of anesthetics on metabolism, on reflexes, and on other neurogenic phenomena

In a paper appearing in 1885, Bert made these remarks relating to thoracic movements, "abdominal respiration," and the dissociation of the two types of respiration under deepening anesthesia

"If we apply on a dog three pneumographs the first one at the level of the upper ribs, the second one over the lower ribs, the third at the umbilicus, we get the following results The upper costal respiration decreases little by little in depth progressively from the disappearance of the corneal sensitivity to death The lower costal respirations, predominant during the phase of stimulation, decreases considerably in depth at the moment of corneal anesthesia and becomes definitely inferior to the two other respirations The thorax collapses, and the pneumographic belt is no longer tight as in the beginning As death approaches, the lower costal respiration is practically zero On the contrary the abdominal respiration, whose depth decreased during the period of stimulation (light anesthesia), becomes predominant and very much so when anesthesia is well established The difference becomes more and more accentuated to its (abdominal respiration) advantage Up to the time of death abdominal respiration maintains its predominance

"Cutting the phrenic nerves arrests abdominal respirations and immediately the thorax, up to then almost immobile, resumes respiratory movements "[3]

The limited knowledge contained in the writings of Snow and of Bert constitutes the background of the subject up to 1899 In that year the distinguished neurologist, J Hughlings Jackson, and a young assistant, James Collier, aided by suggestions from Risien Russell and Howard Sturge, contributed an original and informative paper The title, *Remarks on Loss of Movements of the Intercostal Muscles in Some Cases of Surgical Anesthesia by Ether and Chloroform*, showed clearly the intent of the authors [4]

Since Jackson did not show preoccupation with problems related to anesthesia at any other time in his distinguished career, it is interesting to learn the manner in which he was led to write this paper The work resulted from the stimulation of a chance remark falling upon a trained and inquisitive mind

In 1895, Howard Sturge, a neurologist, remarked in Jackson's presence that Sturge had observed the breathing become "abdominal" under chloroform anesthesia Jackson, sensing a fresh problem in the behavior of the central nervous system, or possibly a solution to one already under his consideration, was quick to investigate He studied patients undergoing anesthesia and soon confirmed the fact that under deep anesthesia the breathing showed alterations, which he carefully described, that were related to paralysis developing in the intercostal muscles From Hewitt's first edition of *Anesthetics* he uncovered Snow's remarks on the subject that have already been quoted

Convinced now that he was on the track of an important observation, Jackson assigned to his young associate, James Collier, the task of pursuing the subject both by animal experimentation and further observations on humans

For his part Collier reported detailed observations on 60 humans subjected to deep anesthesia He noted the development of intercostal paralysis and described it as pictured today He mentioned the free reversibility of the paralysis as anesthesia lightened and deepened

At Jackson's suggestion and with the help of Dr Rusien Russell, he demonstrated the phenomenon on a dog and on a monkey It is interesting that the experimenters took the precaution to insert a tracheotomy tube in order to prevent respiratory obstruction and the confusion in interpretations of the chest movements that might otherwise have resulted Finally, he exposed the intercostal muscles directly and observed them actively contracting under light anesthesia and unresponsive when anesthesia was carried to the deeper planes

Except for the matter of establishing the relationship of intercostal paralysis to the various planes of anesthesia, this paper set forth every thing concerning intercostal paralysis that is of general knowledge today The exact description, the significance as a landmark of deep anesthesia, the ready reversibility the possibility of confusion with respiratory obstruction, and finally the demonstration of the phenomenon as a matter of *comparative physiology* were carefully set forth To Jackson and Collier belongs great credit for these many accurate observations

From this point only a few additional observations are necessary to bring the story up to date. Miller's independent discovery in 1925 has already been mentioned Guedel worked out the presently accepted description of planes and stages of anesthesia. He used Miller s observations on respiration as the primary fact to which the anesthesia scale was anchored

There has been discussion as to the manner in which this progressive and graded muscular and central nervous system paralysis takes place Miller referred to the phenomenon in 1925 as an ascending cord paralysis More recent neurophysiologic evidence would suggest that the respiratory changes of deepening anesthesia are related to a graded sensitivity existing in the cells of the respiratory reticulum. A given degree of narcosis would inhibit impulses arising from certain central neurones which were destined for respiratory musculature of lesser importance The same depth would merely alter, or scarcely affect at all, the impulses originating in the more fundamental respiratory neurones Modern conceptions attribute the deleterious effects of anesthetics and other poisons on the respiratory neurones to either a direct cellular depression or an impairment of synaptic transmission Finally, and quite recently Cassels and his associates have thrown some doubt on the absolute constancy of the progress of impairment and paralysis of intercostal muscular function under deepening anesthesia.[4] They observed 15 instances in 18,000 administrations where diaphragmatic paralysis developed without any concurrent impairment of intercostal muscular activity In connection with Cassels' observation, an earlier one by Paul Bert quoted in this paper is, at the least, of some interest Bert showed that if the phrenic nerve was exposed on an animal under going deep anesthesia and thoracic paralysis, immediately on cutting the phrenic nerve the previously paralyzed intercostal muscles resumed activity

Summary

The history and significance of the phenomenon of paralysis of the intercostal muscles as it occurs in deepening anesthesia have been outlined Several well known medical personalities are referred to in the sketch A major part was shown to have been played by the neurologist J Hughlings Jackson

BIRTH RATE IN 1947 HIGHEST IN A GENERATION

The birth rate in the United States has displayed marked recuperative power since 1933 when it reached the lowest point in our history From the minimum of 16 6 per 1 000 population in 1933 the recorded birth rate rose 56 per cent to 25 9 per 1 000 in 1947 the highest in a generation. The actual figure for last year including unreported births was 27 1 per 1 000 This increase may be attributed largely to the favorable economic conditions and to the special psychologic factors engendered by the war In the prewar years, that is, from 1933 to 1940 the birth rate in the United States increased only 8 per cent whereas from 1940 to 1947 it rose 45 per cent.

TREATMENT OF CUTANEOUS ANTHRAX WITH PENICILLIN

JOSEPH R GRIFFIN, M D , ROBERT H SHANAHAN, M D , and CARMELO E DEANGELIS, M D , Yonkers, New York

(From the Departments of Medicine and Pathology, St John's Riverside Hospital)

FORTUNATELY, anthrax of humans in this country is rare, except in those locations where there are industries that handle hides, wool, and animal products, mainly from cattle, sheep, and horses, and, to a lesser extent, from swine, mice, fox, guinea pigs, and rabbits The occurrence is particularly high in factories using wools from foreign countries

In spite of the many sources of infection, the incidence of anthrax in humans is low in this country According to an analysis made by Smyth, 60 to 80 cases of anthrax occur yearly in the United States with a fatality rate of 17 to 22 per cent [1] A study of collected data shows that, between 1935 and 1940 in Massachusetts, there were 34 cases of anthrax with four deaths, a mortality of 12 per cent, while from 1940 to 1945 there were 21 cases with seven deaths, a mortality of 33 per cent [2] However, it was felt that the high mortality rate was due to ignorance of the disease on the part of physicians outside those serving in tanneries in Massachusetts

It is surprising to the authors that more cases do not occur in this country when one considers that anthrax spores are found in the soil and on the animals of all but five states in this country, Texas, Louisiana, South Dakota, and California being the most heavily contaminated regions In Russia and China, anthrax takes a heavy death toll among horses In Asia Minor, it particularly attacks the angora goat from which a great deal of wool and mohair is obtained Anthrax has proved to be an occupational hazard, especially among wool and leather workers, and sporadic cases have occurred from the use of shaving brushes

The organism, a gram-positive spore-forming, slender and nonmotile rod, is very resistant and can survive for fifteen years Even when buried deep in the ground for years, active spores can be brought to the surface by worms [3] To destroy the organism without injuring the products harboring it is still a major problem The carpet industry has tried various methods of disinfection, but all have proved either ineffective against the organism or so destructive as to make the fibers of the wool impractical for the manufacturing of carpets Even after dyes have been fixed in the fibers, the organism may remain alive Surprisingly, the highest incidence of anthrax at a local carpet manufacturer in Yonkers, New York, occurred in the spinning mill after the wool had been washed and dyed

In view of the increased incidence of anthrax in this country within comparatively recent years, direct federal legislation has been introduced for the prevention of the disease [4] Furthermore, the law requires that all material coming from infected centers must be properly disinfected, or otherwise treated, to reduce or remove the danger of anthrax infection It is felt that no procedure is, at present, entirely satisfactory Some have suggested the wearing of rubber gloves, the changing of clothes to and from work, and the cleaning of exposed parts before eating and after work, and the wearing of masks while on duty at such places in which wool products are manufactured As one can readily see, some of these procedures are quite impractical

Three types of anthrax exist among humans, cutaneous, intestinal, and pulmonary The cutaneous type is the most common and has a mortality rate of 16 to 23 per cent, while the other types, the least common, have carried a mortality rate of almost 100 per cent We are aware of only one case of anthrax meningitis that fully recovered This case was treated with antianthrax serum and penicillin and is included in this report A résumé of the last 82 cases of human anthrax from a local carpet manufacturer revealed 66 cases treated with antianthrax serum, one treated with penicillin and serum, nine treated with penicillin and sulfonamides, and six with penicillin solely There were four deaths one case was complicated with diabetes mellitus, and the other three died of anthrax meningitis The mortality rate in this group was 4 9 per cent Four of the deaths were in cases treated with antianthrax serum, while there were no deaths in patients treated with penicillin

The cutaneous form of the disease usually begins as a single lesion without pain but having a slight itching and burning sensation In approximately twelve hours, a vesicle is formed, about 0 4 cm in size, having a central umbilication and containing brownish fluid Soon the center is replaced by a necrotic, blackish eschar which spreads in all directions and is surrounded by an edematous, purplish skin, producing subjective symptoms of weight and pressure of the part involved The regional lymph nodes may be affected, and, if treatment is not immediately

instituted the anthrax organisms gain access into the blood stream, causing death in three to eight days

Years ago, excision of the cutaneous lesion was generally practiced, but at present such a procedure is thoroughly condemned Human antianthrax serum has been considered very effective and curative in most cases, but the frequent serum reactions are unpleasant to patients and the product is no longer manufactured

Gold, reporting on the treatment of 60 cases of human anthrax, states that sulfonamide compounds are a safe and reliable substitute for antianthrax serum.[6] However, he presents several cases in which sulfonamides appeared ineffective, and serum was required for recovery Of 48 patients with anthrax Lucchesi and Gilder sleeve treated 19 with serum ten with neoarsphenamine 15 with serum and neo-arsphenamine three with sulfanilamide, and one with sulfanilamide, serum and neo-arsphenamine [6] They found that neo-arsphenamine gave the best results in selected cases. They gained a definite clinical impression that patients treated with sulfanilamide did not fare as well as the others and complained of more discomfort which disappeared only after the drug was discontinued

In 1929, Dr Flemming announced his discovery of penicillin [7] He observed that the growth of Bacillus anthracis was inhibited in vitro by a penicillin concentration of 1 10 Thus compared with the inhibition of Staphylococcus aureus at a concentration of 1 40 and lack of inhibition of some gram-negative bacilli at a concentration of 1.5 Heilman, using penicillin inoculated 40 mice with Bacillus anthracis [8] Of the 40 mice 20 received treatment and 20 received no treatment. All the treated mice survived, and all the untreated died within ninety-six hours after receiving the inoculation Miller, Scott, Noe Madin, and Henley tested the efficacy of streptomycin penicillin, and sodium sulfadiazine in experimental anthrax infections in mice [9] They obtained a 92 per cent maximal survival rate with streptomycin, 58 per cent with penicillin, and only 5 per cent with sulfadiazine

Not until 1944 were the first cases of cutaneous human anthrax treated with penicillin. Murphy LaBocetta and Lockwood treated three cases solely with penicillin with a rapid and definite clinical response.[10] In each instance the inflammatory reaction about the lesion showed very prompt regression and the lesion itself underwent rapid involution They felt that 100 000 units was certainly the minimum effective dose, and a total of 200 000 to 400 000 units per day should evoke a satisfactory therapeutic response in the average uncomplicated case of cutaneous anthrax. Ellingson, Knaddull, Bookwalter, and Howe reported 25 patients with cutaneous anthrax treated with penicillin in total dosages from approximately 1,000,000 units to over 4,000,000 units.[11] Three patients also received sulfadiazine. In no instance was B anthracis isolated from the blood after twenty-four hours or more of treatment

The following are 17 consecutive cases of cutaneous anthrax in employes in a local carpet factory who were successfully treated with penicillin at this hospital during the past year (Table 1) Sixteen of the patients were men and one a woman When one considers that there is only a slight predominance of men over women workers at the factory the incidence of susceptibility among the former is much higher The disease occurred mainly in middle-aged individuals, but anthrax respects no age and can attack the very young as well as the very old Although more cases were seen in October, it is felt that there is no seasonal incidence and that this occurrence is nothing more than a matter of chance. More cases elsewhere have occurred in winter and early spring. Anthrax lesions occur mainly on the exposed parts of the body, and our report conforms with this observation. Ten of the 17 cases showed the lesions on the right side and it must be assumed that this side of the body in the right-handed individual is more apt to be exposed than the left

Sixteen cases showed both positive smears and cultures, and one case was negative on smear with a positive culture twelve hours later It was felt that obtaining a smear with a swab was unsatisfactory as insufficient material was obtained by this method In all cases the surface of the lesion was first swabbed with alcohol and then penetrated with a thick, short, platinum wire followed by a stout short platinum loop then smeared on a clean slide In some cases a superficial black crust had to be removed, followed by slight penetration with a platinum loop The contents of the deeper portions of the lesions contained more bacteria than the surface areas. In three cases blood cultures were done and in two of these a growth of anthrax was obtained. The average admission temperature in 17 cases was 99.8 F, and varied from 97 4 to 101.2 F After the administration of penicillin the average highest temperature during the patients' stay in the hospital was 100 7 F and varied between 99 and 103.8 F The average lowest temperature was 97 6 F The red blood cell counts on admission were essentially normal. The white blood cell counts showed an average figure of 8 101 with the highest 13,300 and the lowest 5 100 There was an average segment percentage of 63 Six cases out of 16 revealed slight traces of albumin in the urine

The average number of hospital days in the cases studied was twelve days, with the shortest five and the longest thirty-three

It is a policy of the medical department of the local carpet manufacturer to warn all employes of the danger of anthrax infection and to report all skin lesions promptly to the medical personnel The average time elapsing between the onset of the lesion to reporting to the physician was two days The suspicion of anthrax, the promptness in reporting to the physician, and the immediate institution of treatment were the three factors which made a malignant infectious disease a rather benign innocuous one with a relatively uneventful course in the hospital

All 17 cases were treated with heavy doses of penicillin, supplemented in seven cases by sulfadiazine, in two by sulfathiazole, and in one by sulfadiazine and antianthrax serum In general, each patient received from 100,000 to 300,000 units of penicillin every three hours intramuscularly, with a total average of 12,882,940 units during the hospital course All face and head lesions received, in addition to penicillin, sulfonamides because of the proximity of the lesion to the brain, where there was always a

possibility of meningitis occurring and also the possibility of the ineffectiveness of the penicillin, administered intramuscularly, reaching the meninges in strong enough concentration. In one case, in which there appeared to be meningeal irritation, penicillin was administered intramuscularly and intrathecally in addition to sulfadiazine by vein, and in a second case with definite meningitis, antianthrax serum, penicillin, and sulfadiazine were given. In view of the decreased sensitivity of some strains of B. anthracis to penicillin in vitro and the reported cases treated with this antibiotic being insufficient to draw definite conclusions it was felt safer to administer large doses of penicillin. No ill effects were noted during the course of treatment.

Summary

1. Anthrax of humans in this country is rare except in those localities where industries exist that handle hides, wool, and animal products mainly from cattle, sheep, and horses. It is definitely an occupational hazard, especially among wool and leather workers.

2. Federal law requires that all material coming from infected centers must be properly disinfected, or otherwise treated, to remove the danger of anthrax infection. However, it is felt that present procedures of prophylaxis are not entirely satisfactory.

3. During the past year, 17 consecutive cases of cutaneous anthrax in employes at the local carpet factory were successfully treated with penicillin, supplemented in nine cases with sulfonamides and in one with antianthrax serum and sulfanilamide. All but one patient were men, mainly middle-aged, with the location of the lesions chiefly on the exposed parts of the body and on the right side. Onset of lesion, days in the hospital, and laboratory findings are charted.

4. The suspicion of anthrax, the promptness of reporting to the physician, and the immediate institution of treatment were the three factors which made a malignant infectious disease a rather benign innocuous one with a relatively uneventful course in the hospital.

5. In general each patient received from 100,000 to 300,000 units of penicillin every three hours intramuscularly, with a total average of 12,882,940 units during the hospital course. All face and head lesions received, in addition to penicillin, sulfadiazine. One case was supplemented with antianthrax serum.

6. In view of the decreased sensitivity of some strains of B. anthracis to penicillin in vitro and the scarcity of reported cases treated with this antibiotic, it was felt safer to administer large doses of penicillin. No ill effects were noted during the course of treatment.

AMERICAN COLLEGE OF SURGEONS APPROVES USE OF NURSE ANESTHETISTS

The Board of Regents of the American College of Surgeons at a meeting on February 22, 1948, adopted a resolution commending the services of nurses who have had special training in the administration of anesthesia and recommending the continuance of training courses in this field for nurses. The resolution reads as follows:

> The American College of Surgeons regards with deep concern the actions of some physician anesthesiologists in giving the impression to the laity, in the public press that it is unsafe for experienced nurse anesthetists to conduct surgical anesthesia. While it supports the increasing tendency of having physician anesthesiologists in charge of surgical anesthesia, it deplores at this time any propaganda for the elimination of the trained nurse anesthetist. On the contrary, the American College of Surgeons is of the opinion that in view of the inadequacy in number of the physician anesthesiologists and in view of the splendid record of achievement of the nurse anesthetists, institutions engaged in the training of nurses for this purpose should be encouraged to continue their programs.

ELUSIVE MENTAL CASES

B Liber, M.D , F A P A , New York City

(From the Mental Hygiene Clinic, New York Polyclinic Hospital)

THERE are very light, often elusive, forms of mental disorders, met by every physician without exception, whether he is aware of them or not There is nothing extraordinary about them, as they are the most frequent of all the disturbances of the mind They may inconvenience, annoy, or plague the patient as entities by themselves, without the admixture of any other trouble They may accompany some real organic illness or cause it or originate from it They are by no means obscure or difficult to diagnose if one is prepared to look for them and to recognize their presence However, they are usually disregarded by many practitioners and even by some psychiatrists It is an error to consider them as insignificant True, they are sometimes not very troublesome and need no attention, but many become quite complicated when neglected As they form an inextricable part of the personalities of a large number of our patients, they shape and modify and color all complaints and symptoms If we fail to notice them and treat the more apparent physical conditions only, there is a strong resistance against our best therapeutic methods

Sometimes they are unintentionally improved or even cured by the general practitioner because of a transference unknowingly established between the latter and the health-seeker Some of our medical men, I am glad to say, without any psychiatric knowledge, look for the mental abnormality and discover it instinctively, as the best doctors have always done since the earliest ages of medicine In the majority of the cases, overlooking these mental disorders results in a faulty approach and an inability to heal the condition for which the sick person comes Nor is it certain that, without any intentional planning, the subtle relationship between physician and patient will be the right one and will be helpful If left to chance, it may prove to be unfavorable and quite harmful or, at best, without any effect at all

I shall avoid the word "incipient" for these light mental conditions Although some of them may advance with time into outspoken neuroses and psychoses, many remain unchanged and in the same stage throughout life

These cases may be classified in the same way as the more advanced and more typical ones of a similar nature, or they may not be sufficiently developed to be classified If systematizing is at all necessary, this writer believes that for nonpsychiatrists it will be more practical and easier to understand them if we accentuate either their most outstanding symptoms or the most apparent causes or factors which have contributed chiefly to their existence Thus, instead of grouping them into the uncertain and overlapping chapters of neurosis, psychoneurosis, manic-depressive psychosis, schizophrenia, etc , or the tendencies to these mental diseases, it is preferable to see them as cases largely influenced by the following

Congenital factors, conflicts between parents and children, marital difficulties, educational problems, frustrations, sexual troubles, economic insecurity, psychosomatic conditions, involutional situations, senescence, alcoholism, general maladjustment, trends to amorality and misbehavior, etc Although avoiding monotony and repetitiousness, we shall try to keep as close as possible to the more typical cases

Beginning with the psychosomatic approach, here are some random cases of people who, at first, and properly so, addressed themselves to general practitioners and nonpsychiatric specialists

Case Reports

Case 1 —A single young man, an accountant, went to his doctor, complaining of an "exhausted feeling" and that his heart was "beating, pounding fast" He added that this never happened when he was happy and contented, but only when, for one reason or another, he was sad and frustrated He had learned also that this condition improved by itself when he took a few hours off from his work and rested Whatever difficulties he had in his life became worse through fear of a possible heart disease However, the fact that his heart symptoms were due to his mental state never occurred to him and was unknown to his physician

It was true that he had attacks of tachycardia but was otherwise in good trim physically With few exceptions he had been working steadily and behaving normally He had friends among both sexes and was popular with them, rarely missing a party or an affair He did not drink

Nothing betrayed his inner feelings, his unhappiness, and his effort to adjust They were really most elusive He was treated extensively, but the ups and downs in his condition led his doctor to the belief that there was something else behind the tachycardia The patient was then sent to a psychiatrist

The initial thrust to this patient's mental depression was the death of his father This happened while the young man was serving in the Army He, of course, had to agree to his mother a request for his discharge. In assuming these new economic and emotional responsibilities relaxation changed to tenseness. He was busy and paid less attention to his girl, who resented his newly acquired seriousness and left him for another man

The patient began to show compulsions which he never confessed to anyone until the psychiatrist uncovered them. He could not stand certain people and certain of their actions or motions They were small matters, but they made him miserable, for example, pointing to somebody or something, touching one s lips with a pencil, proximity to anyone etc. He ate much less, because the food was contaminated He slept little because he lay awake thinking of the futility of life We might call this a psychosomatic case in a schizoid individual

His intelligence was above the average Under ordinary circumstances his heart was normal as was his blood pressure Family and personal history, as far as his present condition was concerned, were negative

A complete physical and mental cure took place when his younger brother returned to civilian life and assumed the responsibility of the family and when he himself got married

Case 2 —A woman of 41, married for twenty years, without children, was well until two years ago when she underwent a hysterectomy for the removal of a large fibroid tumor Soon after this uncomplicated event she began to complain of incoherent symptoms which were apparently unrelated to the operation. There were vague pains' at points distant from the pelvis for instance in the neck or the occipital region There were also spells of headache which she strictly differentiated from the other attacks and which she had never had before the operation. Her 'lassitude and general "weakness" failed to conform to her fine appearance and to the negative laboratory findings However together with the sensation that 'something was crawling" over her body she felt the old preoperative heaviness and pressure in the abdomen and accused the surgeon of not having done his job completely Psychologically this was evidently a wish fulfillment. On the other hand she mourned the removal of her uterus and cried when she was alone Outwardly she was adequate. Her work in the house did not suffer and she behaved as if nothing had happened to her Of course her menses had ceased but curiously enough there were no direct menopausal signs

Sedatives and estrogenic medication, administered for over a year, had not the slightest effect One very conscientious physician went over the entire case carefully investigated everything he could had all the necessary laboratory work done repeatedly and arrived at no conclusion

At the first conversation it was revealed that while before the operation she had had only latent expectations of motherhood, they had now blossomed out into a strong longing to give birth to a child. As the last hope had definitely and irretrievably departed she fostered a longing which probably only a lukewarm desire before now became a need Was this a subconscious self-deception a covering up of her great satisfaction at the operation s result, or was she really unhappy at the thought that she could never conceive?

She was advised to adopt an infant and as soon as she did all her unpleasant symptoms disappeared without leaving a trace.

Naturally this patient had a hysteric trend but it was magnified by an important organic change.

65 WEST 05TH STREET

HALF YEAR MORTALITY RATE LOW

The health record among *U.S life* insurance policyholders during the first half of this year has continued at or near the record low of last year with indications that maintenance of the current experience could see a *new record low mortality rate* established this year the Institute of Life Insurance reports. During the early months of the year there was an upturn in the death rate, but since then conditions have improved somewhat

In the first six months of 1948 new record lows were estimated for several death causes, the Institute said. 'Tuberculosis *continued its long* sustained decline this year's death rate from this cause so far being 40 per cent under that of ten years ago

'The death rate from the communicable diseases of childhood showed even more striking ten-year gains The 1948 improvement in all major childhood diseases except measles, over last year s record low brought the rate to a level about one *fifth that of* ten years ago

'Influenza also has abated this year its death rate being well under last year's and about one third *that of ten years ago Pneumonia* shows a slightly lower relative toll this year

"The accident toll is lower again this year with motor vehicle accident fatalities to date being nearly as low as during the war years when auto mileage was restricted and new cars were few

'Heart disease and cancer deaths were the two black spots on the half year health record both showing increases The cardiovascular renal disease group—this being the broad category classified as the area of heart and circulatory afflictions and related ailments—showed a material increase Had it not been for the increase caused by these maladies the half year over-all death rate would have been clearly at a new record low

HYPERTENSION. A MANIFESTATION OF HYPERTENSIVE VASCULAR DISEASE

GEORGE A PERERA, M D , New York City

(From the Department of Medicine, Columbia University College of Physicians and Surgeons, and the Presbyterian Hospital)

BECAUSE the arterial pressure can be measured by a simple and quantitative procedure, it is customary to regard an elevated blood pressure and its modification as of prime importance in the evaluation and management of hypertensive vascular disease As a result, considerable emphasis is often placed on the degree of hypertension as an index of severity and as related to the development of complications and to prognosis

On physiologic grounds, hypertensive vascular disease may be defined as a disorder in which the arterioles possess the functional potentiality for abnormal resistance to the flow of blood Although such increased resistance results in an elevation of the diastolic and mean arterial pressure, it is obviously improper to regard the blood pressure change—the effect of increased peripheral resistance—as the prime or only disturbance

Clinically and pathologically, hypertensive vascular disease may be associated with a variable autonomic nervous system component, with cardiac hypertrophy, and with augmentation of arteriolar and arterial degenerative processes It is the purpose of this discussion to review the evidence as to whether hypertension is but an incidental manifestation or whether the degree of blood pressure elevation can be correlated with these other events which frequently characterize the course of hypertensive vascular disease in man

Blood Pressure in Hypertensive Vascular Disease

A study was undertaken of 250 subjects with established hypertensive vascular disease followed at frequent enough intervals for detailed analysis The average blood pressure at the time of diagnosis was 182/108, the average at the time of last observation (two to forty-one years later with an average period of observation of twelve years) being 202/116 This latter figure excluded critically ill or terminal cases In other words, although there was considerable variation in individual cases, the general tendency of the blood pressure was to increase but slowly throughout the years of observation

In the group studied, the initial level or the maintained height of the blood pressure could not be correlated either with symptoms, rate of progression, or with subsequent development of complications For example, there was no correlation whatsoever between the frequency and intensity of headaches and the degree of hypertension Blood pressure values, never below 200/120, were found to be compatible with two and more decades of comparatively good health Only one observation proved to be an exception a rapid increase in the blood pressure over a period of months was often associated with the rapidly progressive phase of the disease

As the majority of blood pressure determinations are those casually recorded under the specific conditions of a medical examination, it is practically impossible to obtain data under carefully standardized conditions Hence, one cannot exclude the possibility that the unrecognized peaks of extreme hypertension after stress or emotion may be related to progression of the underlying disease process It is, nevertheless, difficult to attach a primary etiologic significance to such a variable factor as the level of the blood pressure

The blood pressure of hypertensive as well as normal subjects exhibits innumerable fluctuations in which age, position, activity, obesity, and particularly emotional state play an important part In fact, the range of lability in some hypertensive individuals far exceeds that observed in normotensives One patient, whose usual blood pressure readings were about 180/100, showed variations from 130/80, following rest and sedation, to 260/150 with excitement and apprehension It must be emphasized that maintenance of pressure in the arterial system is physiologically dependent on many intrinsic as well as secondary regulatory mechanisms, even during the hypertensive state

The systolic blood pressure is usually increased in hypertension, but systolic values within normal limits may occur It is even possible under certain conditions for the hypertensive state to exist without hypertension In response to rest alone, many hypertensive subjects have a reduction in tension to normal values, in one in-

This study was made possible through a grant provided by the National Institute of Health (U S. Public Health Service.)

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York New York City General Sessions May 21 1948

stance to 90/52. Fever may obliterate hypertension for days, and a normal blood pressure may persist for many months after a hypertensive subject has developed a myocardial infarction (even in the absence of congestive failure) or a cerebral vascular accident.

Autonomic Nervous System Component

There are numerous reasons for entertaining the concept that there is a variable disturbance in the autonomic nervous system in hypertensive vascular disease.

Vascular hyperreactivity, as judged by cold pressor and other tests carried out in 20 hypertensives and a similar number of normal controls, was much more frequently associated with an elevated blood pressure. Vasomotor instability was a conspicuous feature in a small percentage of the group of 250 patients closely followed. Some hypertensive subjects were found to be extremely sensitive to orthostatic phenomena induced by experimental stimuli such as phlebotomy or vasodilator drugs. The symptomatic relief and clinical improvement which may follow bilateral thoracolumbar sympathectomy suggests an autonomic component. Transient vasospasm may be part of the hypertensive picture. Rigid sodium chloride restriction, studied in six individuals with hypertensive vascular disease, was demonstrated to modify peripheral resistance but without affecting the patient's ability to respond abnormally to autonomic or neurogenic stimuli.[1] The depressor response to sympathicolytic drugs was pronounced in some hypertensive individuals and not in others.

Ogden has accumulated data indicating that, even in experimental renal hypertension, there is evidence of an extrarenal, neurogenically operated, and sympathetically mediated mechanism.[2] It is also of interest that preliminary studies of the sympathetic ganglia removed from hypertensive subjects at the time of sympathectomy suggest the presence of vascular proliferations which were not found in normotensive individuals.[3] The possibility that the synthetic drug nor-adrenalin is identical with sympathin-E and the pressor properties of this agent have raised obvious analogies that are under investigation. For example Holtz and his coworkers claim to have found increased amounts of nor adrenalin in the urine of 10 of 23 hypertensive patients.[4]

Thus, patients with hypertensive vascular disease appear to possess a variable autonomic component responsible for vasoconstrictive phenomena superimposed on some other mechanism causing increased peripheral resistance. Whether these two factors originate from the same causative source or are completely separate is not clear. Nor can it be determined as yet which one is responsible for the complications of hypertension and its variable progressive course. However, it is traditional to regard lability of blood pressure response as a feature of early hypertension rather than advanced disease. Similarly, the impression gained from the present series suggests that autonomic hyperreactivity is more commonly associated with relatively benign hypertension.

At any event, the most conspicuous feature of the autonomic component is its inconstancy. Witness the variable effects of pressor and depressor tests and of sympathectomy. Autonomic hyperreactivity cannot, therefore be ascribed to the mere presence of an elevated blood pressure. Unless one regards hypertensive vascular disease as representing a group of disorders of different etiology the autonomic component must be interpreted as being a secondary or concomitant phenomenon associated with the fundamental underlying process.

Cardiac Hypertrophy

In the study of 250 hypertensive subjects, an increase in size of the cardiac area was recorded by x ray in 71 per cent at some time during their course. No correlation whatsoever to the intensity or duration of the disease or the height of the blood pressure could be made. In some instances, confirmed at autopsy, cardiac hypertrophy was conspicuously absent. Hearts weighing 300 Gm. and less have been encountered even after twenty years and more of marked hypertension. One woman with hypertension of 225/140 showed no progression in the increased cardiac silhouette by x ray sixteen years later when the degree of blood pressure elevation was unchanged. Yet others exhibited rapid hypertrophy over a short space of time with blood pressure levels in the 150/90 to 160/100 range.

Cardiac hypertrophy is so frequently encountered that an association with hypertensive vascular disease cannot be denied. The hypertrophy, at first confined primarily to the left ventricle, consists of an increase in size as well as hyperplasia of muscle cells but without multiplication of capillaries or alterations in vascular tissue, with the result that relative ischemia may ultimately occur. Although experimental studies in animals and postmortem studies in man may not be true reflections, there are reports which suggest that hypertrophy is accompanied by increases in intra- and extracellular water and sodium and decreases in such intracellular constituents as potassium, phosphorus, creatine, and phospholipins.

The work of the hypertensive heart is increased by virtue of the increased resistance unaccom-

panied by compensatory changes in cardiac acceleration or output Of necessity, there being no commensurate alteration in vascularity, the hypertrophied heart is laboring under an added strain, but, contrary to popular belief, there are numerous reasons why one may doubt that the increased size of the heart is solely related to the degree of hypertension or the work of the heart

Although the role of dilatation and underlying myocardial disease cannot always be clarified, the following observations at least pose a question as to the cause of cardiac hypertrophy The strenuous and prolonged muscular exercise of athletes, it is now agreed, may cause some increase in cardiac size but not invariably greater than the development of other musculature Marked hypertrophy may follow relatively minor valvular lesions, insufficient to add much extra burden to the heart Experimentally, partial constriction of the aorta may produce hypertrophy in animals in a few weeks, even though the actual work of the heart is apparently altered less than in hypertensive disease The production of hypertrophy by overdosage with desoxycorticosterone acetate and salt, its accentuation in experimental nephritic animals which have received desoxycorticosterone and sodium chloride, and its rapid appearance in acute glomerulonephritis with or without hypertension raise doubts as to the mechanism of its production [5]

These arguments favor the view that cardiac hypertrophy cannot be attributed alone to the elevation of blood pressure or to the work of the heart, particularly when long-sustained hypertension is unassociated with cardiac enlargement on occasion The evidence at hand points at least in part to some more fundamental cause

Arteriolosclerosis

Other than at autopsy, arteriolosclerosis can be demonstrated only through involvement of the retinal or renal areas In the group of 250 patients studied, some degree of arteriolar irregularity or arteriovenous compression in the optic fundi appeared in 94 per cent, with hemorrhage, exudate, or papilledema apparent in 19 per cent Again there was no correlation with the height of the blood pressure, and in some instances hypertension of long duration failed to produce any retinal alteration Although the more extensive vascular changes were generally associated with advanced disease and a poor prognosis, in a few subjects even severe retinitis showed conspicuous regression without drop in blood pressure Some cases of accelerated hypertension with severe arteriolar nephrosclerosis were comparatively free of retinal arteriolosclerosis so that it was found wholly impractical to grade the hypertensive state on the basis of the eyegrounds

In the present series, about one third of the hypertensive group eventually exhibited some renal abnormality in the form of relative polyuria, nocturia, diminished concentration power, and albuminuria, with or without the presence of urinary red blood cells Nitrogen retention developed in 5 per cent The absence of any direct relationship to the blood pressure level was again a noticeable feature Accelerated hypertension developed in one patient whose blood pressure never exceeded 180/100, another individual whose tension invariably stayed above 200/120 for more than twenty-five years was free of renal symptoms or signs of impaired function

Although renal involvement is usually a bad omen, several notable exceptions have been observed One patient had persistent albuminuria for fifteen years, another lived seven years after nitrogen retention was first discovered, and yet another case, proved at autopsy to be nephrosclerosis, maintained abnormally high nonprotein nitrogen values in the blood for more than ten years before he died

It is generally agreed that hypertensive vascular disease is more than casually associated with arteriolosclerotic lesions in the majority of instances The arterioles involved include primarily the kidneys, pancreas, periadrenal tissues, and liver, whereas other areas, e g , the spleen are often spared or only minimally involved or are seen so commonly in normotensive subjects as to be interpreted with caution In the accelerated phase of the disease, necrosis, advanced hyalinization, and petechial hemorrhage may be added to the arteriolosclerotic picture These findings are most conspicuous in the kidneys, frequently in the choroid and retina, and, only to an irregular and lesser extent, in other tissues and organs

Almost all investigators agree that organic changes in the renal arterioles occur in a high percentage of cases but that a small group of hypertensive subjects exhibit no demonstrable abnormality It is also established that even renal arteriolosclerosis may occur in the absence of hypertensive vascular disease or hypertension

As summarized recently by Evelyn, to regard hypertension as the sole cause of arteriolosclerosis is obviously untenable, inasmuch as arteriolosclerosis is encountered among normotensives [6] To feel that arteriolosclerosis is a process of aging causing hypertension when it affects the kidneys, a view expressed by Goldblatt and others, is still open to question, because even renal arteriolosclerosis may occur in the absence of hypertension [7] Evelyn does admit that "since there is no reliable method of calculating

the degree of impairment of renal circulation which corresponds to any observed degree of renal arteriolosclerosis, acceptance or rejection depends on differences in the interpretation of the functional significance of the observed pathologic changes "

The available data leads us to a third and more likely point of view, that propounded by Kimmelstiel and by Bell[9] Again, in Evelyn's words, "hypertension and arteriolosclerosis are independent processes which often undergo parallel development, and are capable of intensifying one another in the later stages of their evolution"

Arteriosclerosis

In this series of 250 patients 18 per cent complained of cardiac pain at some time during their observed course myocardial infarction occurred in 9 per cent and electrocardiographic changes indicative of myocardial damage developed in 38 per cent Cerebral vascular accidents occurred in 12 per cent of this group and were frequently unrelated to stress or exertion Some long-sustained hypertensives lacked any evidence of large artery disease at autopsy It should once again be emphasized that no consistent relationship of any of these complications to blood pressure levels or duration of the disease could be established

In any survey of the pathologic picture of a chronic or protracted disorder, it may be observed that changes are often attributed to the basic disease when in reality they may merely represent concurrent events that have no dependent relationship It is still debated as to whether arteriosclerotic changes are only associated lesions such as are frequently found in comparable age groups or whether they result from some unfavorable influence exerted by the disorder on the arteriosclerotic process

The frequency of coronary artery disease cerebral vascular accidents and peripheral vascular changes among hypertensives is advanced as an argument that degenerative alterations in arteries are related to abnormal elevations of blood pressure. Others feel that a certain degree of pathologic change would give rise to more serious complications in subjects with an elevated blood pressure

The balance of opinion favors the thesis that hypertensive vascular disease augments the production of arteriosclerosis. Experiments have been conducted to show that normal arterial walls can withstand pressures twice as great as those ever found in hypertension. Experimental increases in hydrostatic pressure have produced more marked atheromatous changes in rabbits than could be induced by high cholesterol diets alone This argument is further borne out by the majority of careful analyses of autopsy material, such as those of Wilens[10] Although age and nutritional state were independently related to atherosclerosis, this author found that the incidence of severe atherosclerosis was considerably higher in all hypertensive groups as compared with the corresponding ones without hypertension

Discussion

It is apparent to all that death in hypertensive vascular disease is due chiefly to cardiac hypertrophy, arteriosclerotic complications, and, on infrequent occasions, to arteriolar nephrosclerosis Death is obviously not the result of an elevated blood pressure alone For this reason the question as to whether hypertension leads directly to these complications or exists as an incidental manifestation is an important one. If an elevated blood pressure is responsible for ultimately fatal sequelae then measures aimed at lowering the arterial tension have a therapeutic place If hypertension is but one manifestation of a diffuse and variable disorder then attention should be focused elsewhere

The evidence summarized in this review points strongly toward a group of independent processes related to or augmented by hypertensive vascular disease not necessarily related to each other and so variable in the degree and rate of their appearance that a direct correlation with the level of the blood pressure is conspicuously absent. Rather than look upon the blood pressure as responsible for other complications it would be preferable to regard it as one of a group of effects, all stemming from the same underlying disorder It follows therefore, that an evaluation of therapeutic procedures which lower the blood pressure should take into consideration the mechanisms whereby this effect is achieved and that treatment, to be successful, must do more than reduce the height of the blood pressure. Indeed one may question the practical benefit of lowering the arterial tension unless the progress of vascular pathology is modified at the same time

It must be kept in mind however, that this hypothesis is based on inconclusive information in several respects No data are available on the relation of basal blood pressure levels or on the unrecognized peaks of tension following stress There is still no convincing evidence to exclude the possibility that prolonged drops in blood pressure may alter the progress of the other aspects of the disease

One thing is clear from the available information Too much emphasis has been placed on the height of the blood pressure in its relationship to the complications of hypertensive vascular

disease Too often patients are warned that, because their arterial tension is markedly elevated, they are subject to grave danger unless immediate measures are taken Of 100 patients questioned with reference to their first knowledge of hypertension, 68 were acutely frightened by the information they received or the manner in which it was imparted to them The data at hand do not justify such an attitude, nor should the physician, regardless of the evidence, be guilty of adding to fear and apprehension in a variable chronic disease which frequently is compatible with decades of normal living

Conclusions

1 Evidence is reviewed, supported by clinical data, indicating that an elevated blood pressure is but a manifestation of hypertensive vascular disease

2 Autonomic hyperreactivity, cardiac hypertrophy, arteriolo- and arteriosclerosis are frequently but not invariably part of the hypertensive picture

3 The lack of any consistent relationship of these complications to each other or to the degree of hypertension suggests that they are produced or are augmented by separate mechanisms independent from those which elevate the blood pressure

4 Evaluation of therapy must consider modification of these mechanisms rather than emphasis on blood pressure levels

PREPARE GLOSSARY OF TERMS USED IN ATOMIC ENERGY

To better inform the physician, the Council on Physical Medicine of the American Medical Association has prepared a glossary of terms used in atomic energy and nuclear physics

The introduction to the pamphlet says that "nuclear physics as it develops will have important consequences to the practicing physician New types of injury may require treatment, new hazards will require prevention, and new methods of treatment, diagnosis, and research will be introduced In attempting to inform himself about recent discoveries the physician is constantly baffled by the new vocabulary which contains some words too recent or too technical to be found in older or less specialized dictionaries The present glossary is intended to be helpful in this respect"

VICTORY FOR BIOTICS OVER DISEASE IS SEEN

Future developments in the new science of antibiotic therapy may make it possible before long to combat, if not to eliminate, all plant, animal, and human disease, Dr Selman A Waksman told the National Tuberculosis Association meeting at the Pennsylvania Hotel recently

Dr Waksman is a professor at Rutgers University and the New Jersey Agricultural Experiment Station in New Brunswick.

After surveying the field of antibiotics, Dr Waksman said "One is inclined to become optimistic and assert that before long all human and animal diseases, and possibly also plant diseases, will be combated if not completely eliminated"

This, he cautioned, was an optimistic point of view, but an impartial examination of recent developments in isolating soil-growing micro-organisms and applying them to disease in man "have fully served to justify the optimistic outlook"

Dr Waksman pointed out that a mere fraction of the micro-organisms had been examined They grow in soil of varying types throughout the world in pools of water, on food products, and in a number of other substrates

Only two of the antibiotics isolated so far have become true chemotherapeutic agents (streptomycin and penicillin), Dr Waksman said, but the recent discovery of chloromycetin, aerosporin, and polymixin, in addition to subtilin, nisin, and others, gives promise for the future

Each of the antibiotic agents apparently is effective against specific disease germs, he added, and germs not affected by presently known substances may be combated by micro-organisms to be discovered

Some disease germs become resistant to antibiotic agents in the course of treatment, and Dr Waksman said medical science needed to develop more potent agents or combinations of antibiotics that will not permit resistance to develop

"The prospects for antibiotics are promising, the future is bright indeed," he said

SOME CONTRIBUTIONS OF PHYSICAL MEDICINE IN POLIOMYELITIS

ARTHUR L. WATKINS, M.D. Boston, Massachusetts

(From the Department of Physical Medicine, Massachusetts General Hospital, Boston Massachusetts)

IN THE absence of any specific treatment for patients with acute anterior poliomyelitis, the salvaging of all undamaged or recoverable neuromuscular units is the major aim of treatment in the convalescent patient. The therapeutic procedures utilized for this purpose are primarily in the field of physical medicine. Application of heat in various forms and particularly therapeutic exercises have been generally accepted as established methods of treatment. The basis for the use of these physical methods, however, has largely rested upon clinical observations. Heat has been found effective in relieving pain in extremities, together with rest, either with or without the use of mechanical aids for immobilization. The tendency to muscular shortening has been dealt with usually by splints or braces in the early stages and later by passive stretching. Strengthening of weak muscles is obtained by prescribing graded resistance during active muscular contractions. This in brief is the rationale for the use of these well-known physical procedures.

In recent years the lay public, patients, physicians, and all those treating poliomyelitis patients have been made aware of the possibilities of different and more effective methods of treatment or even cures. This has focused the attention of scientific investigation on the problems of understanding the fundamental mechanisms of dysfunction of muscles in this disease. Considerable research on this problem has been done in many different medical centers which has been made possible largely through the aid of the National Foundation for Infantile Paralysis and similar agencies. I would like to review for you the results of some of these studies which relate to physical therapeutics. Although they are of primary interest to the field of physical medicine, where the knowledge is put to practice, the research is a cooperative effort of a team of specialists interested in the poliomyelitis patient including the pediatrician, neurologist, orthopedist, and physiatrist, together with those primarily concerned with the basic sciences such as physiology and pathology.

Research

Electromyography.—One of the controversial and still unsolved problems of infantile paralysis is an explanation of the common finding in muscles of hyperirritability, pain, and tendency to contracture, frequently described merely as muscle "spasm." Seeking objective methods of observation, electromyography has been utilized in many different centers in this country and abroad, and results have been obtained which are quite comparable.[1-11] It has been possible to record an abnormal amount of electrical activity from muscles apparently at rest and in a position of maximum relaxation during the early acute stages of the disease. The amount and distribution of this electrical activity seemingly bears no constant relationship to the presence or absence or degree of muscular weakness at the time of the observation. A still more striking finding during the acute stage of poliomyelitis is the hyperirritability of muscles upon stretching. It is possible by only moderate passive stretching to obtain abnormally high voltage electrical discharges in muscles of varying degrees of voluntary motor power from nearly normal to marked paresis. Completely paralyzed muscles however, or at least ones which eventually are found to be paretic are usually electrically silent.

A different type of electrical record is obtained in the later stages of the disease. In weak muscles, most commonly those with only 20 to 60 per cent of normal power, a characteristic finding is that of discrete high voltage diphasic spikes discharged from resting muscles and similar in appearance to electromyograms obtained from muscles whose peripheral nerves are regenerating with only partial reinnervation present. This type of electromyogram may be observed many years after the onset of the disease in patients with only partial return of power. In cases with good recovery this type of irritability disappears, and only normal voluntary action potentials are recorded.

A further type of electrical abnormality is that of minute discharges of very short duration characteristic of the fibrillation of denervated muscles as occurs after section of a peripheral motor nerve. Such irritability cannot be ascertained clinically as there is no visible muscular contraction, but its presence is of some prognostic value as will be discussed later.[11]

When one attempts to correlate electromyographic records with the clinical findings, we can make only hypothetical conclusions since

Presented by invitation at the 140nd Annual Meeting of the Medical Society of the State of New York, New York City, General Sessions, May 21 1945.

there is still not enough information available concerning the pathologic changes during the recovery stage of the disease Electromyograms in the acute stages, particularly from muscles with only minimal or moderate paralysis which show signs of sensitivity clinically, present a record of fairly continuous high frequency, high potential discharges which have the same appearance as those obtained from muscles splinting an injured bone after a fracture We are not certain of the origin of this involuntary muscular activity, but one possible explanation is disease in the sensory reflex arc, particularly of the dorsal root ganglion, which might initiate reflex contraction of motor units which are only slightly involved The irritability to passive stretching might be explained on the same basis or, perhaps more likely, on the basis of lesions of the motor side of the reflex with partial involvement of anterior horn and/or internuncial cells in the motor pool with loss of some normal inhibitory activity [12 13] The action potentials seen during the later stages of recovery are similar to those from muscles seen during regeneration of peripheral nerves and may indicate some actual axonal regeneration, or they may simply represent discharges from muscles containing only a very few functioning motor units We are more certain about the origin of the low voltage, short duration discharges, as they resemble so closely the fibrillation of denervated muscle They probably illustrate the innate irritability of muscles deprived of nerve supply and consequent hypersensitivity according to the law of denervation of Cannon [14]

Another controversial point in the clinical picture of poliomyelitis is concerned with the loss of well-coordinated control of muscles It is well known that substitution of muscle groups, not ordinarily concerned with the motion tested, may occur when weak muscles or even strong ones contract during attempts to exert maximum effort It is also known that in the presence of pain, muscles with antagonistic action are frequently brought into action, apparently as a splinting mechanism Electromyography has revealed that the cocontraction of agonist and antagonist in patients with partially paralyzed muscles in poliomyelitis is a common occurrence [2] It has also been shown by electromyography that this may disappear with improvement in muscle strength and muscle re-education, thus providing an objective rationale for such treatment [10]

Electromyography has been of prognostic use in establishing the degree of likely recovery in any particular muscle group [11] In general, muscles with a high degree of electrical activity, particularly high potential spontaneous discharges at rest, are most likely to improve in strength On the other hand, complete electrical silence or the presence of denervation fibrillation is a poor prognostic sign [11]

Electrical Excitability—Another method of studying the functional capacity of muscles is by measuring their irritability to measured amounts of electrical stimulation This is of particular importance where one wishes to establish that the lack of motion is due to disease of anterior horn cells rather than only apparent paralysis as has been suggested and described under the term of "alienation" Electrical stimulation has an accepted role in distinguishing hysterical paralyses from organic ones, and hysterical reactions, as might be expected, are occasionally observed in patients with poliomyelitis as with the other types of infection As a rule, however, changes in the chronaxie or the strength-duration curve give us objective evidence of damage to the lower motor neuron and are, accordingly, useful adjuncts in evaluation of the degree of involvement, in following recovery, and in prognosis The technics of electrical stimulation and electromyographic recording have been combined to study conduction velocity of nerves and transmission of impulses across the neuromyojunction [15] This represents another important method of quantitative evaluation of neuromuscular function still only partially explored

Treatment

Heat—These methods of investigating neurophysiologic processes in patients with poliomyelitis may be carried into the clinic and utilized to evaluate physical therapeutic procedures We know that muscles are hyperirritable and that pain is present, and so we have some basis for the use of heat We know that heat will increase the pain threshold and have some slight effect on muscle irritability as measured electromyographically [16 17] Heating does not always, however, have beneficial effects on muscular strength and, when applied to an extreme degree, may be deleterious, particularly to the epiphyses of growing bone [18 19] There appears to be no marked superiority in the application of heat in one form as compared with another in relieving muscle pain or spasm

The effect of drugs on muscular function may also be measured electromyographically, but I will omit a discussion of this subject as it is not, strictly speaking, physical medicine [17]

Muscle Testing—The accurate measurement of muscle strength in patients with poliomyelitis is of primary importance Muscle testing is used to assist in diagnosis, as a record of the status of function and progress, in prognosis, in

accurate prescription of muscle re-education, and also as a basis for reconstructive surgery.[20] The manual tests originally devised by Lovett, when standardized have a surprising degree of accuracy and repeatability when done by experienced technicians.[21] However, newer methods involving electronic measuring devices have been devised which may prove to be superior and enable us to pick up finer degrees of weakness and to study better the recovery process and effective therapy.[22]

Exercise Muscle Re-education.—The decision as to which muscles to exercise, the position during exercise, and the degree of resistance is based on the knowledge obtained from our muscle strength tests. The general principles governing technic of muscle re-education are fairly well standardized in hospitals and centers treating poliomyelitis patients and in schools training physical therapists. Variations occur as to the amount of passive stretching permitted in the early cases and also as to the time when ambulation is permitted. In any event, good muscle re-education is based on sound knowledge of muscular anatomy and function and skill is developed only with experience in handling many patients with varying degrees of involvement.

Development by the patient of "muscle sense" as well as strength is part of the aim of therapy. Usually, in the early stages, heavy loading of muscles is omitted, as this tends to favor substitution and mass contraction of muscles. At this stage the emphasis is on maintaining normal motor patterns by passive and active assisted exercises even though muscles are severely weakened. The goal is that of maximum coordination and any activity which maintains coordination and adequate kinetics of the motions involved is permissible. Patients must always be carefully followed to detect and prevent habits of faulty bodily mechanics which may lead to deformities such as hyperextension of the knee and twisting of the trunk. It is essential that patients be followed by those trained in observation of articular mechanics so that necessary support or prescription of activity can be provided to pace the therapeutic program to the needs of the patient. I would like to reiterate for sake of emphasis that there is no substitute for accurate evaluation of musculoskeletal mechanics in the over-all therapeutic program consisting of physical medicine, protective braces, and finally corrective surgery if necessary, for patients with residual paralysis.

It is extremely difficult to evaluate the effectiveness of any new type of therapy or modification of physical treatment in this disease because of the natural tendency to spontaneous recovery with only the minimum of supportive therapy. For example, it has been shown that all but the completely or nearly paralyzed muscles will usually show a remarkable degree of return of power with nothing more than adequate rest, support, and graded activity. Undoubtedly, many more patients have complete recovery or no significant residual weakness with no treatment other than a few days of bed rest. With this knowledge in mind one would therefore hesitate to recommend very radical or energetic physical treatment of a nonspecific nature during the acute stage of the disease. Our knowledge of the presence of abnormalities in the cerebral spinal fluid persisting for weeks or months after the onset of the infection gives further support to a therapeutic program which allows for a maximum conservation of energies to aid in establishing immunity and reparative tissue reactions.

It seems probable that many patients do not receive the optimum physical treatment resulting in completely efficient use of the residual neuromuscular units. With this thought in mind groups of patients have been studied in late convalescence, or even those who have residual weaknesses of many years duration to determine whether special exercise technics might be of value in improving function. DeLorme has shown that weak atrophic muscles, following immobilization necessitated by trauma or surgery can be quickly brought back to normal strength by systematic exercises employing the principle of progressive resistance.[23] Exercises of this type make use of maximum loads on the muscle with few repetitions of the individual exercises and have been used successfully by weight-lifters to develop muscles to a remarkable degree. This method of muscular strengthening has been studied by us in a group of patients with residual paralysis from poliomyelitis and gratifying improvement has been noted. In order to grade the exercises systematically special apparatus has been developed allowing accurate knowledge of muscle loads.[22] The muscle selected for exercise ordinarily must have sufficient power to move the affected joint through a nearly normal range of motion. If strength is insufficient to allow movement against the forces of gravity counterbalance may be employed without diverting from the principle of developing muscle power based on the premise of relatively few repetitions of exercise at maximum muscle load or resistance. In poliomyelitis patients the actual load of the muscle may be less than that of the weight of extremity when counterbalancing is employed, but still the exercise is a near maximum exertion comparable to that of weight-lifters with normal muscles and extremely heavy loads. Studies of

improvement in muscle strength in a series of such late cases of poliomyelitis have revealed that muscle strength can be improved to a significant degree by this method of exercising, as judged by ability to walk greater distances without fatigue and use less apparatus for support Even though manual testing showed little change, the use of this type of exercise has apparently a definite place in the therapeutic program aimed at developing maximum muscular efficiency

Other contributions in the field of physical medicine are those aimed at rehabilitation in an over-all sense, including problems of mental and social adjustment to handicaps when present The morale of patients with poliomyelitis is notably excellent in most cases This is probably not a matter of chance alone nor simply due to the fact that the majority of the patients are children with remarkable powers of adjustment Much credit is due to those treating the patients by endowing a spirit of optimism and encouragement Constant vigilance and skillful guidance in the therapeutic program is essential, however, to prevent progressive deformities which otherwise would obliterate any rehabilitation program based on social needs alone Further advances can be expected when our knowledge of the fundamental nature of the pathogenesis of neuromuscular dysfunction is increased or when a specific cure is discovered

Summary

The major aim of treatment of the convalescent patient is the salvaging of all available neuromuscular units The measures utilized are in the field of physical medicine Recent research, particularly electromyographic studies and other quantitative electrical measurements of muscle function, have provided a scientific basis for the use of heat and therapeutic exercise New technics for improving muscle strength, even in late cases, have been developed by means of progressive resistance exercises

POLIO FIGHTERS ARE MOBILIZED FOR OUTBREAK

Polio fighters all over the country are mobilized in preparation for the usual summer outbreak of this crippling childhood disease

In a series of 300 "grass roots" conferences, public health and hospital officials and other professional personnel from each community will be brought up to date on latest methods for fighting the disease From two to a dozen conferences will be held in each state The conferences are sponsored by the National Foundation for Infantile Paralysis

It is too early to say yet whether there will be a big epidemic of the disease this summer And there is no specific cure for it, nor any way of preventing polio epidemics, Basil O'Connor, president of the National Foundation for Infantile Paralysis, pointed out But, he said, "we have learned that early diagnosis and prompt modern hospitalization can do much to halt the ravages of this crippling disease "

The preparedness meetings are being planned so that hospital beds, special equipment, and trained personnel will be available for emergencies and so that health and medical authorities will know where to get nurses and physical therapists and about the National Foundation's epidemic aid teams and emergency equipment pools

For the first time, Mr O'Connor said, pools of equipment such as respirators (iron lungs) and hot pack machines will be strategically located at San Antonio, Texas, Atlanta, Georgia, Boston, Columbus, Ohio, and Denver —*Science News Letter, June 12, 1948*

THE SURGICAL TREATMENT OF ADVANCED CARCINOMA OF THE CERVIX

ALEXANDER BRUNSCHWIG M.D , New York City
(From the Memorial Hospital Center for Cancer and Allied Diseases)

THE treatment of carcinoma of the uterus varies, depending upon the site of the primary lesion In general, the treatment at present for carcinoma of the cervix is irradiation While this form of therapy has made great progress in the past and is capable of effecting cures, the fact remains that the majority of women who develop carcinoma of the cervix die of complications resulting from failure of its control Once irradiation has been carried out and the neoplasm persists or recurs, further irradiation will rarely be successful in controlling the growth. Yet repeated attempts to do this are the usual course of events, and not infrequently, repeated irradiations entail disturbances which are as distressing to the patient as the disease It would appear that little consideration has been given to the possibilities of radical surgery under these circumstances. The prejudice against surgery in the treatment of cervical cancer would seem to be very strong Undoubtedly this is due to the emphasis that was placed on the high mortality (15 to 20 per cent) that accompanied the surgical attack upon cervical cancer in the early decades of this century In the past two decades much progress has been made in the supportive treatment of the surgical patient. Thus, major procedures in the abdomen entail much less risk than in the era when the classical series of radical hysterectomies by Wertheim and Bonney were developed

In the course of an investigation of the possibilities of modern surgical treatment for carcinoma of the cervix, it was felt that the selection of patients for operation should be minimal consistent with good surgical judgment A number of patients were received who had had irradiation therapy and in whom there was persistent or recurrent disease, still localized to the pelvis and without evidence of distant spread The surgical problems varied with the extent of local disease and for purposes of discussion they will be classified as follows

1 When the recurrent or persistent neoplasm is confined to the cervix and/or the tissues in the immediate vicinity, there would appear to be no contraindication to the performance of a radical supravaginal hysterectomy with pelvic lymph node dissection.

2 When the recurrent or persistent neoplasm has extended to one or both lateral pelvic walls and affords the impression of a 'frozen pelvis' on bimanual examination it has been my experience that the impressions from "within and above" the pelvis as obtains through a laparotomy incision are very frequently different from those which obtain from bimanual vaginorectal pelvic examination and that a "frozen pelvis' found upon the latter examination does not prove to be 'frozen" when dissection is carried out from above and within the pelvis. A plane of separation can usually be developed, and the neoplasm and its extensions circumvented

3 When the above conditions obtain and at laparotomy it is found that one ureter is involved the radical panhysterectomy with node dissection is carried out, and, in addition, the involved portion of ureter is resected The upper ureter is implanted into the sigmoid colon

4 When bladder is invaded, a radical panhysterectomy with lymph node resection and total cystectomy is performed The entire procedure may be carried out in one operation. During the course of the operation, the ureters are transected and implanted into the pelvic colon The uterus, adnexae, pelvic nodes, and areolar tissue and urinary bladder having been freed except for their attachments to the pelvic floor the abdominal incision is closed, the patient put in the lithotomy position, elliptic incisions made to encompass the introitus, and the structures referred to previously are removed from below The perineal wound is closed tightly except for a hard rubber drain

5 When recurrent neoplasms involve both bladder and rectum it is necessary in these desperate situations to remove the pelvic colon uterus, vagina, recurrent tumor, and bladder A laparotomy is performed, both ureters are transected, and areolar tissues and nodes along the external and common iliac vessels are freed and retracted mesially The hypogastric arteries and veins are ligated and divided, the urinary bladder is freed entirely from the symphysis down to its attachment to the urogenital diaphragm The lower sigmoid is transected First one and then the other of the ureters is implanted into the sigmoid by modified Coffey I methods. The upper end of the transected sigmoid is then brought out of the abdomen through the midline wound, the latter is closed and the patient placed

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City General Sessions, May 19 1948.

in lithotomy position Elliptic incisions extending from the symphysis pubis anteriorly to the tip of coccyx posteriorly are then made, and the entire freed contents of the pelvis are removed from below The perineal wound is closed tightly except for hard rubber drains at each angle of the wound One interesting feature of this operation is that peritonealization of the pelvis is impossible since all of the pelvic peritoneum has been removed, but this entails no complications, since all the intestines which fall into the pelvis become adherent throughout most of their extent and there is no opportunity for sharp kinking to produce obstruction This very extensive operation has been carried out on 22 occasions for various types of recurrent carcinoma of the female genital organs which involve bladder and rectum There have been five surgical deaths, all in the first one to two weeks following operation No patient succumbed in the operating room Thus, the surgical mortality has been 23 per cent Of those patients surviving, palliation has been gratifying indeed and some of them have been returned to almost normal physical activity Some of these patients, in addition to their usual housework, have returned to part-time employment outside the home

It must be remembered that this group of patients represented the most advanced type They had all had some form of irradiation therapy repeated once to several times, and some of them had had conservative surgical operations No other form of therapy was available that afforded reasonable promise of palliation Operation not only resulted in removal of large masses of neoplastic tissue which in themselves produce certain discomfort hardly ameliorated by sedation, but the fistulae, vesicovaginal or rectovaginal, or both, that were present were done away with, thus relieving the patients of the discomfort due to these factors

Comment

Carcinoma of the cervix remains within the pelvis for long periods before producing metastases outside the pelvis This is well illustrated by the findings in 65 autopsy protocols from the Memorial Hospital of patients dying of carcinoma of the cervix Half of these patients presented no macroscopic evidence of spread beyond the pelvis at time of necropsy They had died of uremia or infection or a combination of both Thus, it would appear that an attempt to deal with persistent or recurrent carcinomas after failure of irradiation therapy might be worth while

Years of experience are necessary with these types of operations in order to arrive at very definite impressions as to the real additional longevity that might be afforded to these unfortunate sufferers The brief experience so far obtained, however, clearly indicates that appreciable degrees of palliation are possible Until some biologic method of control of these growths is discovered or unless some newer types of irradiation are developed, bold surgical attempts to remove these recurrent or persistent neoplasms would seem to be in order Those experienced in the management of these advanced cases realize full well that they have nothing to lose and everything to gain by undergoing a surgical procedure that might afford them prolongation of life in comfort Furthermore, with the benefits of modern supportive treatment for the surgical patient, the immediate risks are not out of line with the end that it is hoped to achieve

The surgical mortality statistics in this initial series of cases may be cited at this time There were 12 patients who received the radical panhysterectomy with lymph node dissection for persistent or recurrent cervical carcinoma, there was no surgical mortality There were 37 patients in whom a ureter or a portion or all of the bladder were removed, a portion of the rectal colon with panhysterectomy, or in whom pelvic colon, recurrent tumor, all of the vagina, remaining uterus, adnexae, and urinary bladder were resected There were nine operative deaths, thus the surgical mortality was 24 per cent This would compare favorably with the surgical mortality in the initial attempts to deal with cancer of the stomach, esophagus, cardio-esophageal region, and lung It would seem, therefore, that radical surgery may prove to have something to offer in patients with carcinoma of the cervix, recurrent, after attempts have been made at control by irradiation therapy or the more conservative standard types of operation

---

COURSE IN NURSING OFFERED BY DEPARTMENT OF HOSPITALS

The Division of Nursing of the New York City Department of Hospitals has a twelve-month course.

It is open to women from 18 to 50 who have graduated from elementary schools and are fitted, physically and temperamentally, to be nurses Students will receive maintenance, uniforms and $10 a month, and a two-week vacation

CLINICOPATHOLOGIC CONFERENCES

FOURTH MEDICAL DIVISION OF BELLEVUE HOSPITAL New York City

Date. January 26, 1948

Conducted by EMANUEL APPELBAUM, M.D

Bacterial and Virus Pneumonias

Case 1—F D, a 70-year-old white man, was admitted to Bellevue Hospital for the second time on December 3, 1947 because of cough and bloody expectoration

The past history revealed that the patient was in Bellevue Hospital in 1945 because of a myocardial infarction. Since then he had been moderately dyspneic on exertion and had orthopnea There was no ankle edema He took digitalis sporadically until three days prior to his present admission.

The present illness began four days prior to admission with a "cold," running nose, and sore throat. He remained ambulatory and on the day prior to admission had a shaking chill with a temperature rise to 102 F He continued to have chilly sensations, began coughing, and expectorated blood-streaked sputum. Just prior to admission he received some penicillin, but the amount was not known.

Physical Examination.—The temperature was 103 6 F, the pulse rate 113 respirations 24 and the blood pressure 100/70 The patient appeared well nourished, had a hacking cough and did not appear to be in distress The positive physical findings were moderate injection of pharynx, dullness at the left base with crepitant rales over the left lower lobe posteriorly and laterally with bronchial breathing, and few moist rales at the right base, point of maximal impulse in fifth intercostal space outside the midclavicular line, grade III systolic murmur over entire precordium, loudest at apex. The second aortic sound was louder than the second pulmonic sound, and the ventricular rate was 113 per minute

Laboratory Data.—The white blood count was 16 950 with 3 polymorphonuclear leukocytes 86 stab forms, 4 lymphocytes, and 7 monocytes. On the day following admission the white blood count was 20,250 with 6 polymorphonuclear leukocytes, 86 stab forms and 8 lymphocytes The red blood cell count was 4,460,000 with 13.8 Gm of hemoglobin Blood cultures on three successive days following admission were all negative The erythrocyte sedimentation rate was 96 mm. per hour, the blood nonprotein nitrogen 32 mg per 100 cc. The blood Mazzini reaction was 4 plus, the blood Wassermann was negative Cerebrospinal fluid analysis was negative Urinalysis showed specific gravity of 1 025, 3 plus albumin, but otherwise negative Nose and throat cultures many pneumococci which did not type, Staphylococcus albus, Streptococcus viridans, gram positive bacilli and gram negative micrococci The electrocardiogram showed left axis deviation and left bundle branch block.

X-rays—"Pneumonitis at right lower lobe possibly left lower lobe, not clearly visualized and partially obscured probably by cardiac silhouette."

Course—The patient was started on penicillin 50,000 units every three hours and a salt-poor diet and was given 2 cc of mercuhydrin intramuscularly, oxygen, and digitoxin 0.2 mg daily His temperature dropped from 103 0 to 101 4 F within twelve hours and then promptly rose to 104.6 F The patient now presented some cyanosis of the lips and nail beds and appeared acutely ill and in a shocklike state. The temperature continued to range between 104 4 and 104 6 F for another sixteen hours, at which time sulfadiazine 2 0 Gm initially and 1 0 Gm every four hours, was instituted This produced little change in his condition The temperature rose to as high as 105 F and continued to range between 103 6 and 104 6 F on the third hospital day On the third hospital day the patient appeared very restless, and bubbling rales were heard throughout both lung fields The pulse and blood pressure became imperceptible but returned after administration of 50 cc of 50 per cent glucose intravenously Congestive heart failure which became prominent on the second hospital day became more marked on the third hospital day, and another 2 cc dose of mercuhydrin was administered It was further advised that both the penicillin and sulfadiazine dosage should be increased However before this additional therapy could be employed the patient expired

Case 2—W R. a 67 year-old white man was admitted to Bellevue Hospital for the second time on November 28 1947 because of chills and fever of two days duration

Past history revealed that the patient had an appendectomy for acute appendicitis at Bellevue Hospital twenty-five years ago He had had swelling of his ankles in the past, but there had

been no dyspnea or orthopnea and no knowledge of heart disease

The present illness began two days prior to admission, when the patient felt hot and developed a shaking chill and pain in the left anterolateral chest while waiting in line for food at the Municipal Lodging House This pain persisted and was aggravated by deep inspiration He had an occasional cough, but there was no expectoration or sore throat During the two days prior to admission he had had numerous shaking chills

Physical Examination—On admission, the temperature was 105 4 F , the pulse rate 85, respirations 30, and the blood pressure 145/70 The patient was a poorly developed, obese man who appeared chronically ill and who, during examination, experienced a shaking chill The positive physical findings were chest expanded poorly bilaterally, with medium moist rales at the right base and bronchial breath sounds over the right upper lobe The heart rate was 85 with a normal sinus rhythm, a grade III systolic murmur at the apex and base and second aortic sound louder than the second pulmonic, extremities showed excoriations and scabs over both legs, and there was a left varicocele and hydrocele

Laboratory Data—On admission the white blood count was 8,850, with a marked shift to the left Urine showed a specific gravity of 1 025 with 3 plus albumin and three to six white cells and three to five red cells per high power field and was otherwise negative The blood nonprotein nitrogen was 28 mg per 100 cc , the Mazzini reaction was negative Blood cultures on the first two days were negative Cold agglutinins were negative A blood specimen for the psittacosis complement fixation test was sent to Dr Karl F Meyer of the Hooper Foundation, San Francisco, but the report was not available antemortem

X-rays—On admission there was "diffuse engorgement of the lower halves of both lungs which may be pneumonic in character Small effusions at both bases Heart enlarged in the transverse diameter Slight bulge at the base of the aorta" On the third hospital day a chest x-ray revealed "heart moderately enlarged Marked widening of the entire arch of the aorta Extensive chronic passive congestion involving both lungs with some tendency to fibrosis and confluence of the lesions in the lower half of both hemithoracies"

Course—The patient was given 100,000 units of penicillin every three hours In addition, he was given oxygen and infusions of glucose in saline His temperature which, shortly after admission, had risen to 106 4 F dropped progressively to 101 4 F at the end of twenty-four hours The white blood count on the second hospital day was 17,000 with a marked shift to the left The lungs showed numerous moist rales at both bases On the morning of the third day the temperature rose to 103 4 F and fluctuated from 101 to 104 0 F throughout the fourth and fifth hospital days On the fifth hospital day the patient still appeared acutely ill The white blood count was now 11,100 with marked shift to the left It was advised that sulfadiazine therapy be given in addition to penicillin, and he received an initial dose of 4 0 Gm with 1 Gm every four hours thereafter Throat culture on the sixth hospital day showed Streptococcus viridans and Staphylococcus aureus A sulfadiazine level at this time was 5 3 mg per 100 cc On the sixth hospital day the temperature began falling and went from 102 6 down to 100 4 F The patient appeared subjectively improved The chest showed findings of consolidation at both lower lobes with bronchial breath sounds and sibilant and subcrepitant rales over the right upper chest anteriorly and posteriorly On the seventh hospital day the temperature continued its downward trend going to 99 0 F , rising once again to 100 4 F and then going down to range between 97 4 and 99 0 F The patient raised a scant amount of sputum for the first time on the seventh day, and this revealed a pneumococcus which did not type, Staphylococcus aureus, and Streptococcus viridans On the eighth hospital day there were diffuse signs over both lung fields The patient continued to require an oxygen tent A sulfadiazine level on this day was 6 1 mg per 100 cc The patient had a fairly good day, and the temperature ranged from 99 0 to 100 0 F Toward evening he tapped on the oxygen tent to warn the nurse of sudden distress and, when seen, was found to be unconscious, breathing deeply and slowly by gasps He was cold and clammy There were no audible heart sounds, and the peripheral veins were markedly distended Caffeine was administered without effect, and the patient expired

Discussion

DR. EMANUEL APPELBAUM These two cases are similar in certain respects and can be discussed together Important differences between them will be brought out later in the discussion It is clear from the presentation that pneumonia was the dominant disease in both cases The important questions are, "What was the type of pneumonia?" and "What was the final cause of death?" in each patient

Since primary atypical and virus pneumonia are prominent possibilities, it seems worthwhile to preface the analysis of our cases with a brief discussion of the salient features of these pneumonias During the past few years, primary

atypical pneumonia has come into prominence because of its increased incidence Clinical similarity of this disease to the proved virus pneumonias, particularly psittacosis, and its resistance to sulfonamides have greatly contributed to the concept that it is due to a virus infection Indeed, it is commonly referred to as "virus" or "viral' pneumonia However, pneumonias of nonviral origin such as coccidioidomycosis toxoplasmosis, Q fever, and that due to certain bacteria, notably P tularense can give a very similar picture. Even cases of proved pneumococcic pneumonia may on occasion resemble primary atypical pneumonia It is also necessary to mention the recent studies on the isolation of an indifferent streptococcus from a number of cases of primary atypical pneumonia. It appears, therefore, that primary atypical pneumonia is a clinical entity with multiple causes and that the term "virus" pneumonia is not appropriate for this disease

The clinical and pathologic aspects of primary atypical and of proved virus pneumonias are very similar The disease is ushered in by headache, chilliness or frank chills, fever cough, and muscular aches in the chest and abdomen The cough is usually dry at the onset but may become productive later in the disease The respiratory rate as a rule, is only slightly increased, although there may be a marked degree of dyspnea associated with cyanosis. A relative bradycardia is common during the first week. In general, the physical signs in the chest are surprisingly few while the roentgenograms will show considerable changes in the lungs The pneumonia is characteristically a patchy, migrating pneumonitis, varying in density from mottling to frank lobar consolidation There is little tendency to involve the pleura

The initial white blood count is normal or low with 65 to 90 per cent segmented neutrophils However, a slight leukocytosis may occur, especially during convalescence. There is often a moderate albuminuria. At necropsy, the lungs show a diffuse confluent bronchopneumonia, together with areas of hemorrhage, necrosis, and vascular thrombosis. The alveolar exudate is composed largely of fibrin, red cells, and macrophagic monocytes The alveoli in addition, may have a hyalin-like lining.

There is considerable difference of opinion as to the value of the cold agglutinin test in the differential diagnosis of primary atypical pneumonia It seems that cold agglutinins appear in about 50 per cent of cases of primary atypical pneumonia. Titers of 1 64 or more are significant and constitute strong evidence for this disease. Even more important is the demonstration of a rise and fall in the titer of cold agglutinins during the patient's illness As a rule, the agglutinins appear early in the second week of the illness, rise progressively and attain the highest titer in the third week, and fall appreciably during the fourth week. There is some evidence that the height of the titer bears a relationship to the severity of the illness. High titers of cold agglutinins are uncommon except in primary atypical pneumonia, rubella, infectious mononucleosis, and in chronic diseases associated with splenomegaly

For the definite diagnosis of a virus pneumonia it is necessary either to isolate the virus from the patient's blood or sputum, or to demonstrate in the patient s serum the presence of specific antibodies in significant titers. This can be illustrated with psittacosis or ornithosis, a disease of specific virus etiology The most striking feature of this disease is the early development of pneumonia During the early phase of the disease it is at times possible to make a definite diagnosis by isolating the virus from the patient s blood or sputum. More commonly, the diagnosis is established by obtaining a positive complement fixation test. Of particular significance is the demonstration of a two- to fourfold increase in the titer of complement fixing antibodies. However *it is important to point out in connection with* the complement fixation test that there are cross reactions between psittacosis virus the Eaton virus, meningopneumonitis virus, and the virus of lymphogranuloma venereum.

In this connection it is important to note that the host range of psittacosis is now known to be much more extensive than was previously thought. Contact with birds of the parrot or pigeon family is no longer essential to suspicion of the disease Bird droppings contain the virus in large amounts and may be responsible for respiratory invasion in man There is also evidence that a patient with psittacosis can initiate human to human transfer

With these preliminary remarks let us examine our cases. In the first case there was an extensive pneumonitis of a severe form In addition the patient had advanced arteriosclerotic heart disease associated with coronary artery closure and congestive heart failure The clinical course was short and the terminal picture was a combination of circulatory and pulmonary insufficiency and severe toxemia. It may be noted that the nasopharyngeal cultures yielded a mixture of organisms, which are normal harbingers of that cavity

In regard to the type of pneumonia, the diagnosis would seem to rest between primary atypical and bacterial pneumonia. I am inclined to *lean toward the bacterial type. This gains par*ticular support from the blood counts which showed aleukocytosis with a high percentage of

stab forms However, primary atypical pneumonia complicated by secondary bacterial infections can produce this type of blood picture It is quite possible that one or more of the organisms recovered from the nasopharyngeal culture served as the causative agent

There is also a possibility that the pneumonia in this case is superimposed on pulmonary infarctions Small infarcts may occur in congested lungs as a result of local vascular thrombosis, or they may be of the embolic type, originating in mural thrombosis in the right side of the heart or in phlebothrombosis in the peripheral veins The last-mentioned source is the most common one even in cardiacs It is well known that pulmonary infarcts are frequently complicated by a secondary pneumonitis due to the descent of organisms from the upper respiratory tract The bacterial flora is mixed and may include anaerobic micro-organisms In some instances, the pneumonia may advance to suppuration and even abscess formation In this connection, it is well to remember that pulmonary edema per se can simulate pneumonia and be the cause of fever and leukocytosis

The patient's failure to respond to chemotherapy can be attributed to the severity of the infection and to certain unfavorable contributory factors, particularly the advanced age of the patient and the presence of severe congestive heart failure

In the second case there was a confluent bronchopneumonia with some pleural involvement The features in this case that need to be emphasized are the recurring chills, the slight cough, the temperature-pulse dissociation, the normal or slightly elevated leukocyte counts, and the temporary clinical improvement followed by a rather sudden death The throat and sputum cultures revealed a mixture of gram-positive cocci There was also evidence of the presence of arteriosclerotic heart disease without apparent congestive heart failure

It is clear from a review of the salient features of this case that both primary atypical and definite virus pneumonia are prominent possibilities It may be noted that the patient's serum was negative for cold agglutinins However, a negative test during the first week is of no value in the diagnosis of primary atypical pneumonia The possibility of this case being a true virus pneumonia, such as psittacosis, has an even greater appeal This thought led us to submit the specimen of blood to Dr Meyer for the psittacosis complement fixation test

The sudden death of the patient following a short period of improvement suggested the occurrence of either pulmonary embolism or of a cardiac complication, such as coronary artery closure or cardiac standstill The description of the terminal picture is in favor of a cardiac death

Dr Morris Pearlmutter These cases appear to have an important feature in common, namely, the occurrence of a shock syndrome due to overwhelming infection The fact that severe infection may produce shock should always be uppermost in our minds, particularly from the standpoint of therapy The investigations into this field by Ebert and Stead clearly indicate that measures to increase the circulating blood volume with blood and plasma transfusions are without effect Unless the infection is effectively brought under control at the earliest possible moment, these patients will die The importance of early recognition of the shock as being due to infection is, therefore, obvious [1]

Report of Complement Fixation Test for Psittacosis —Dr Meyer's report, received postmortem, revealed the patient's serum to fix complement in the presence of psittacosis antigen in serum dilution 1 2 (4 plus), 1 4 (4 plus), 1 8 (4 plus), 1 16 (4 plus), and 1 32 (4 plus)

Pathology

Dr Henry Spitz In Case 1, anatomic diagnosis gave the following information severe, generalized arteriosclerosis, hypertrophy and dilatation of heart, sclerosis of coronary arteries, severe, with calcification, fibrosis of myocardium, infarct of myocardium, healed, apex and apical portion of interventricular septum, chronic passive congestion of viscera, lobar pneumonia, resolving, right lower lobe, acute splenic tumor, and fatty degeneration of renal tubules

Autopsy disclosed the following

The heart was enlarged in all diameters and weighed 660 Gm The right auricle, ventricle, and the corresponding valves appeared unaltered The wall of the right ventricle was thickened, measuring 1 to 10 mm The left auricle and ventricle were moderately dilated, mitral and aortic valves presented scattered fibrous nodules at the base and free border The myocardium of the left ventricle was firm, red with fine streaks of gray, and measured 25 to 30 mm in thickness At the apex and the adjacent portion of the interventricular septum it was thin and replaced by fibrous tissue, and the lumen of the ventricle bulged into the interventricular septum The coronary arteries were stiff and markedly narrowed by atherosclerotic plaques at the ostia and at many points along their course without complete occlusion of the lumina All major arteries were the seat of numerous atherosclerotic plaques with calcification and occasional ulceration The liver was large, weighed 1,800 Gm , and showed evidence of severe chronic passive congestion, the other viscera showed similar changes of a lesser degree There was no edema or no free fluid in any of the body cavities

The lungs showed moderate diffuse congestion

The left lung weighed 575 Gm The right lung weighed 950 Gm. The right lower lobe was firm, rubbery, and airless The cut surface was dark red, mottled with gray, and had a peculiar ground-glass appearance. Postmortem culture from this lobe showed only contaminants The tracheobronchial lymph nodes were enlarged, soft, and moist The kidneys were large, having a combined weight of 580 Gm. The parenchyma was reddish brown, the corticomedullary markings were distinct The increased weight was due in part to the presence of many cortical cysts the largest of which measured 3 cm in diameter and occupied the entire thickness of the parenchyma The other organs showed no relevant gross changes.

Microscopic examination of the lung showed marked diffuse congestion. The alveoli of the right lower lobe were filled by masses of large mononuclear cells Few polymorphonuclear leukocytes and little fibrin was present. The picture was that of a resolving pneumonia

In the kidneys considerable degenerative changes were found in the tubules The epithelium was swollen, granular, contained sudanophilic vacuoles, and was often desquamated

Sections from other organs yielded no additional pertinent information

In summary, this was a patient with severe arteriosclerotic heart disease and an old myocardial infarct who apparently developed coronary insufficiency in the resolving stage of a lobar pneumonia. The associated renal lesion is not uncommon in cases of severe pneumonia

For Case 2 the anatomic diagnosis was as follows confluent lobular pneumonia, both lower lobes resolving acute fibrinous pleuritis with effusion, acute fibrinous pericarditis acute lymphadenitis of bronchotracheal lymph nodes, acute splenic tumor, hypertrophy and dilatation of heart, edema of lungs, acute passive congestion of liver, and congenital anomaly of heart bicuspid aortic valve and separate origin of the circumflex and descending branches of the left coronary artery

Autopsy of Case 2 showed a slender, well-developed body There was no peripheral edema The following pertinent findings were noted each pleural cavity contained 2 000 cc. of yellow, clear, stringy fibrinous exudate covering the pleural surfaces. Similar exudate was found attached to the thoracic cage by dense fibrous adhesions The apex of the right upper lobe was occupied by a dense retracted fibrous car Each lung weighed 1,100 Gm Both upper and the right middle lobes were boggy, and abundant frothy fluid exuded from the cut surfaces. Both lower lobes were firm, fleshy, and dark red. The bronchopulmonary and tracheobronchial lymph nodes were enlarged, soft, moist, and reddish-gray streaked with black.

The heart was enlarged, weighed 500 Gm , and showed a thickened left ventricle The coronary arteries showed mild atherosclerotic changes The aortic valve was bicuspid each cusp being of equal size The cusps were slightly fused and quite rigid due to nodular deposition of calcium No horizontal or vertical bar could be identified in either cusp Three coronary arteries took their origin from the anterior cusp One was the right coronary artery and the other two, arising closely together in the opposite angle of the sinus of Valsalva, were the left circumflex and the left anterior descending branch, respectively The aorta and large blood vessels showed only slight atherosclerotic changes. The liver was large, weighed 1 780 Gm. and appeared congested

The gallbladder was small and thick walled and contained about fifteen faceted calculi The spleen was enlarged and congested The kidneys were large, their surface was finely granular, and a few larger deep scars were noted The cut surface showed no notable changes. The other organs showed no important abnormalities.

Microscopic examination of the lungs (lower lobes) showed marked congestion of the alveolar walls. The alveoli contained numerous large mononuclear phagocytes and clumped fibrin. Few polymorphonuclear leukocytes were present No hyaline membranes and no notable interstitial reaction were observed The remainder of the lung showed edema. Section from other organs yielded no significant additional information.

The lesions in the lung were not characteristic or suggestive of "atypical" or virus pneumonia. It is, therefore, difficult to classify this case as virus pneumonia on anatomic grounds The positive complement fixation test is no absolute evidence for the identification of the pulmonary lesion observed at autopsy since a rather high antibody titer may be present weeks and months after the clinical disease has subsided

The terminal episode suggested rapid cardiac failure with edema of the lungs and acute passive congestion of the liver The pleural effusion was in part inflammatory and in part probably the result of passive congestion

The anomaly of the aortic cusp was interpreted as congenital, since both cusps were of equal size and no remnant of fusion could be detected The stenosis of the aortic ostium might have been responsible for the hypertrophy of the myocardium but essential hypertension cannot be excluded since the aortic stenosis was very mild

NECROLOGY

Reuben Cronson, M D, retired, formerly of New Rochelle, died on July 6 at the age of eighty-nine Dr Cronson was graduated from the College of Physicians and Surgeons, Columbia University, in 1888 and later studied at the University of Vienna He was a founder of Philanthropin Hospital, New York City, organized in 1905, which was later renamed Jewish Memorial Hospital Dr Cronson was a former president of the medical board of the latter hospital He had also been visiting gynecologist at Philanthropin Hospital and had worked in the Cancer Research Clinic, New York City In 1947 he received a certificate from the Medical Society of the State of New York in recognition of his fifty years of medical practice He was a member of the American Medical Association and the New York State and Westchester County Medical Societies

Charles Wilmer Fitch, M D, died on July 1 at his home in the Bronx His age was seventy-four He was graduated from the College of Physicians and Surgeons, Columbia University, in 1899 and had practiced medicine in New York City for forty-five years Dr Fitch was a member of the American Medical Association and the New York State and Bronx County Medical Societies

Alice M Flood, M D, sixty, of New York City, died on June 1 A graduate of the University of Michigan Medical School in 1909, Dr Flood was a member of the American Medical Association and the New York State and County Medical Societies

Onslow Allen Gordon, M D, sixty-one, died on June 8 at his home in Brooklyn Dr Gordon was graduated from Long Island College Hospital in 1911 A captain in the Army Medical Corps during World War I, he had formerly served as associate professor of gynecology and clinical professor of obstetrics at New York University College of Medicine and also as attending physician on the staff of Greenpoint Hospital, Brooklyn, and associate surgeon at St Mary's Hospital, Brooklyn Dr Gordon had been director of the Department of Obstetrics and Gynecology, Carson C Peck Memorial Hospital, Brooklyn, since 1930 He was also an associate gynecologist at Bellevue Hospital

A fellow of the American College of Surgeons and of the New York Obstetrical Society and former president of the latter, Dr Gordon was a member of the American Medical Association, the Brooklyn Gynecological Society, and the New York State and Kings County Medical Societies

Anatole Kolodny, M D, New York City, died on July 8 at the age of fifty-five Dr Kolodny was a graduate of the Imperial University of Kazan in 1917 He served as regimental chief surgeon of the Imperial Russian Army until the Bolshevik Revolution He went to Germany in 1919 and served as an assistant in pathology at Berlin Pathological Institute until 1922 ,when he came to the United States He was an instructor in the medical schools of the University of Illinois and the University of Iowa

He came to New York in 1934 and at the time of his death was a neurosurgeon on the staff of Beth-El Hospital and the Brooklyn Hebrew Home and Hospital for the Aged Dr Kolodny was a fellow of the American College of Surgeons and a member of the American Medical Association, the American Association of Pathologists, the American Association for the Surgery of Trauma, the American Association for the Advancement of Science, and the New York State and County Medical Societies

Charles F Prairie, M D, of Massena, died on June 30 at the age of sixty-four Dr Prairie was graduated from Syracuse University College of Medicine, in 1906 He served as attending physician on the staff of Massena Memorial Hospital, Massena

Dr Prairie, a former president of the St Lawrence County Medical Society, was a member of the American Medical Association and the New York State and St Lawrence County Medical Societies

Franklin Raphael Strong, M D, of Brewerton, died on June 20 He was seventy-one years old A physician in Brewerton since 1905, Dr Strong was graduated from Syracuse University, College of Medicine, in 1904 He was a member of the American Medical Association and the New York State and Onondaga County Medical Societies

Joseph Zicarelli, M.D, of New York City, died on June 28 at the age of sixty-four Dr Zicarelli was graduated from the Long Island College Hospital in 1909 and had practiced medicine in New York City ever since He was a visiting physician at St Vincent's Hospital, New York Eye, Ear, and Throat Infirmary, and New York Post-Graduate Hospital

Dr Zicarelli was a member of the American Medical Association and the New York State and County Medical Societies

---

THE GENERAL PRACTITIONER'S OBLIGATION TO HIS PATIENTS

A man should be a thoroughly good doctor, whatever group he belongs to A man belonging to the general practice group should take particular pains to see that he is as nearly correct in his answers as possible He should not excuse himself by saying, "I am only doing general practice" It is much better when in doubt to call for consultation than to jeopardize the patient and one's own status by giving questionable treatment

The minimum duty of a general practitioner is to attend faithfully his hospital staff meetings He is sure to learn something scientific each time, and, further, it brings him in contact with his fellow staff members —*California Medicine, April, 1948*

HOSPITAL NEWS

MacCurdy Reports Increase In State Hospital Population

THE upward trend in the population of the 27 mental institutions under the jurisdiction of the Department of Mental Hygiene has accelerated during the past year, Dr Frederick MacCurdy, Commissioner of Mental Hygiene, has revealed. A preliminary survey of the figures reported as of March 31, 1948, by the department s 20 mental hospitals, six State schools for mental defectives, and Craig Colony for epileptics indicated that the population of these institutions has increased by 3 240 over the corresponding total at the close of the previous fiscal year

At the close of the fiscal year (March 31) the department's institutions were caring for a total of 103,448 patients, of these, 90,266 were in the institutions 1 810 in family care, and 10 372 were in convalescent care, said Dr MacCurdy The patient population in the institutions increased by 2 786 during the year, while those in convalescent care increased by 346 There was an increase of 108 among those in family care.

One hundred years ago there was only one State hospital, the New York State Lunatic Asylum at Utica in 1848 this institution was caring for 495 patients At that time an additional 1 215 patients were being cared for in various county asylums and poorhouses throughout the State, making a total of 1,710 mental patients who were being provided for in public institutions of the State. Sixty years ago there were seven State hospitals which in 1888 had a resident population of 5 171 patients, these, together with 9,106 patients in various county asylums, made a total of 14,277 patients being cared for in public institutions of the State. Twenty five years ago there were 13 civil State hospitals with a resident population in 1923 of 41 302 patients.

At the close of the fiscal year 1948 the State hospitals were caring for 87,468 patients an increase of 2,947 during the year Dr MacCurdy pointed out that this increase, almost twice the corresponding increase for the previous year, indicates an acceleration in rate toward the level existing prior to the war

Of the 87,468 mentally ill patients, 77 675 were residing in the hospitals 1,119 in family care, and 8 674 were in convalescent care Compared with figures for the previous fiscal year these represent increases of 2 472, 60, and 406, respectively The growth in family care is slow owing to difficulties in finding suitable family care homes

Public Opinion Survey Used to Guide Sidney Hospital s Board

A SURVEY of public opinion on The Hospital, Sidney, was conducted in June by a community relations committee appointed by The Hospital's board of managers Questionnaires to determine how familiar the public is with The Hospital and what it thinks should be done to meet increasing demands for care were mailed to several thousand citizens of Bainbridge Guilford Masonville, Unadilla, Sidney and other communities in The Hospital s service area.

In a foreword to the questionnaire Dr Joshua E Sweet, president of the board of managers wrote

"During the four complete years of The Hospital s existence, 4,225 patients have been admitted, 1,003 babies have been born and 2,644 major and minor operations have been performed The rapidly increasing need for its services is evidenced by the rise of 72 per cent in the number of admissions and of more than one hundred per cent in the number of operations over this period

'Today virtually every bed in The Hospital is filled throughout the year and at times it is caring for as many as 45 patients in space designed for 30 The board of managers is faced with the immediate problem of meeting this urgent demand for greater facilities.

Although The Hospital is owned and operated by the Town of Sidney more than half its patients come from other towns, principally Bainbridge Guilford Masonville and Unadilla.

Report Says Full Psychiatric Facilities Now Available at Mount Sinai

THE Mount Sinai Hospital New York City released its fifty ninth annual report in July reporting that the institution during 1947 had cared for a record number of patients, had expanded its education and research projects, and had established a tumor clinic.

The hospital also attained a long-sought objective of affording full facilities for psychiatric treatment in all phases of patient care. The services are handled by 60 specialists The hospital s psychiatric division comprises an adult outpatient clinic, a child-guidance clinic a 22-bed inpatient ward and a comprehensive liaison network between the psychiatric structure and the institution s traditional services

According to George B Bernheim president emeritus of the hospital 16,838 inpatients were cared for a rise of 1,319 over 1946, and there was an increase of 10 000 outpatient visits Mount Sinai also continued to expand its medical house staff

NEWS NOTES

Dr Edwin G Zabriski, acting director of the Neurological Institute at Columbia-Presbyterian Medical Center, New York City, speaking at a dinner marking the closing of the Veterans Rehabilitation Clinic at the medical center in July, advocated the establishment of night psychiatric clinics for low and moderate income groups The veterans clinic was closed, he said, because acute types of war-engendered neuroses were no longer encountered

Comforts of home life will be among the things emphasized in Wing R, the new addition to Strong Memorial Hospital, Rochester, Dr John Romano, professor of psychiatry at the University of Rochester and psychiatrist-in-chief at the hospital, told the Rochester Rotary Club at a meeting June 23 None of the necessary appointments of a modern hospital will be omitted, he declared Although the work in the building will be integrated with that of the medical and surgical work of the hospital, it will deal chiefly with the emotionally sick and will be largely preventive in nature

• • •

New plans for the proposed Massena Memorial Hospital call for 27 private rooms, five four-bed wards, five three-bed wards, and 14 beds for children

•

The new six-story wing of the Sisters Hospital, Buffalo, which the Sisters of Charity plan to open in September as part of the centenary of their work in Buffalo, is about completed, according to an announcement from the hospital. The one-story portion of the building will house an outpatient clinic, and the rest will provide quarters for interns, operating rooms, and laboratories for medical research and diagnosis

• •

Cornwall Hospital was presented with a new, modern ambulance on June 11 as a result of a special campaign of the hospital staff and the community Dr T D McMenamin, chief of the medical staff, made the presentation speech, paying special tribute to the late Dr R. W Thompson for his efforts as chairman of the ambulance campaign

Plans for the expansion of Lourdes Hospital, Binghamton, will make the hospital capable of caring for 140 children and adults and 36 newborn infants, doubling the present capacity Four new operating rooms, modernized and enlarged delivery rooms, demonstration and classrooms for student nurses, and new facilities for the pediatrics, x-ray, emergency, and laboratory departments are also planned

Hospital administrators and medical men will be particularly interested in "The Case of Mrs Conrad," a new March of Time film now being shown to the general public in theaters throughout the nation The film tells the story of an operation from the moment the family doctor suggests hospitalization until the patient, fully recovered, returns to her home It touches on the details of hospital procedure, the work of the medical personnel who aid in the operation, and the provision of hospitalization benefits, such as those provided by Associated Hospital Service—New York's Blue Cross Plan

• • •

According to the 139th annual report of the French Benevolent Society of New York and the French Hospital, New York City, inpatients treated at the hospital last year totaled 7,944, as against 8,640 the year before The outpatient department reported 51,228 visits in 1947, against 53,724 in 1946

• •

Eighty-three per cent of this year's graduating class of the New York University College of Medicine will serve internships in hospitals of Greater New York, Dean Currier McEwen announced at Last Day Exercises of the College in June

"You are now assuming, along with thousands of your fellow alumni, the responsibility for the medical care of a large part of this community," Dr McEwen told the graduates "Over the years it has become established that one in every six doctors practicing in Greater New York received his training at New York University College of Medicine, a record of service that is unique among medical schools of this area." Of the 132 graduates, 109 will serve internships in Greater New York hospitals, and 61 per cent of this 109 will serve in the public hospitals of New York City, he said

• • •

The Halloran Veterans Administration Hospital in Staten Island is to be enlarged in bed capacity by one third, David P Page, deputy V A administrator, announced The program will increase the number of beds from 1,125 to 1,500 by January 1, Mr Page said

Dr Harold H Berman, assistant director of St Lawrence State Hospital, Ogdensburg, and Dr William R. Carson of the Potsdam Hospital staff are conducting a course in abnormal psychology for teachers during the summer session at Potsdam State Teachers' College The major emphasis of the course is on behavior disorders of children with special attention to school problems, illustrated by actual case studies, and the basis of psychiatric advice in these cases with emphasis on the role of the teacher in both recognition and follow-up of serious problems The course includes an historical survey of the humane, legal, and scientific aspects of and a brief résumé of major schools of psychopathology Demonstrations of clinical examples of major mental disorders are held at St Lawrence State Hospital

PERSONALITIES

Elected

Dr Emil Goetsch, retiring as director of the surgery department at Long Island College Hospital, Brooklyn, after 20 years of service, as a member of the board of regents of the hospital. As president of the staff of Good Samaritan Hospital Suffern, Dr Emanuel Freund, Haverstraw

Appointed

Dr Rulon W Rawson former associate physician at Massachusetts General Hospital, Boston, and assistant professor of medicine at Harvard University, as chief of the division of clinical investigation at Memorial Hospital Center for Cancer and Allied Diseases, New York City, and associate professor of medicine, Cornell University Medical College.

Dr Freddie Homburger associate of Sloan Kettering Institute and former head of clinical investigation at Memorial Hospital New York City, as research professor of medicine and chief of the new cancer control and research unit at Tufts College, Boston.

Former chief of division of neuropsychiatry at Montefiore Hospital New York City Dr H Houston Merritt as director of neurological service, at Presbyterian Hospital s Neurological Institute and professor of neurology at Columbia University, College of Physicians and Surgeons.

Dr Hans Kraus, as assistant professor of clinical rehabilitation New York University College of Medicine, and director of muscle re-education and therapeutic exercise at the Institute of Rehabilitation and Physical Medicine, New York University—Bellevue Medical Center

To the house staff at Albany Hospital, Dr Dogan Parese of Kirkaneli, Turkey, as intern in surgery and Dr Hector A. Quesada, Havana, Cuba, as assistant resident in anesthesia.

Six resident physicians to hospital staff of Ellis Hospital, Schenectady Dr Alfred Walter Lucas, Hornell, Dr Jason LaRue Wiley, Jr , Auburn, and Dr Glen E Cooley, Schenectady, surgery, Dr John Daniel Diono, Waterbury, Connecticut, and Dr George E York Schenectady medicine, Dr Edward B McCabe, Rensselaer, radiology, Dr Robert A. Berault, Schenectady, and Dr Charles Poskanzer, Albany, pathology, Dr Craig Lyon Benjamin, Schenectady obstetrics and gynecology and Dr David Glenn McFadden Thorndale, Canada, orthopedic surgery

NEW DRUG POSSIBLE TB REMEDY

Trial of a new drug as a possible remedy for tuberculosis is getting under way, Dr Alfred Burger of the University of Virginia announced at the first national medicinal chemistry symposium sponsored by the American Chemical Society in Ann Arbor Michigan.

The drug is a Japanese cousin of quinine called cepharanthine Several drugs derived from quinine have been studied for possible use in tuberculosis but only cepharanthine has shown any promise Dr Burger said.

It was first isolated in Japan shortly before the war It is now available in this country, but since the studies have 'barely started' no conclusions about its effectiveness can be drawn as yet.—*Science News Letter June 26 1948*

VICTORY OVER CANCER REPORTED NEARER

Victory over cancer seems nearer in view of advances reported by Atomic Energy Commissioner Lewis L. Strauss to a Senate appropriations subcommittee

Cancer patients, however should be warned not to expect immediate benefits from these advances They are important steps along the road to victory but there are still many obstacles to overcome

One advance involves the injection of radioactive colloidal gold, from the atomic pile at Oak Ridge directly into cancers. This brings cancer-destroying beta rays from millions of point sources, instead of from six or eight into play on the cancer It means increased cancer destruction with less damage to surrounding healthy tissue. Dr Paul F Hahn of Vanderbilt University, Nashville who developed this method of cancer treatment, is as enthusiastic as any true scientist allows himself to be in the first stages of a new development. But he does not say he has a cancer 'cure More time must elapse before that can be determined

Still far from application in cancer treatment but impressive in its possibilities is the second advance reported by Commissioner Strauss. This consists in successfully getting a cancer-destroying radioactive chemical to go directly to the part of the body desired, without any dangerous stops in healthy tissue The success has been achieved in the case of one organ the kidney and so far applies only to rats, mice and rabbits. The chemical used is radioactive iodine. It is done by a kind of vaccination procedure. Advantage is taken of the fact that an animal will make antibodies to tissues of another species of animal when these get into the first animal s body The antibodies are specific. If they are for example, antirat kidney they will go straight to the rat s kidney when injected into a rat. When mixed with radioactive iodine they take this chemical along with them. The hope now is that the technic can be applied to directing radioactive chemicals to cancers in the human body The work leading to this advance was done by Drs. David Pressman and Geoffrey Keighley of California Institute of Technology now at Memorial Hospital s Sloan Kettering Institute in New York.—*Science News Letter June 26 1948*

MEDICAL NEWS

Postgraduate Courses for Naval Reserve Officers

UNDER the auspices of the Commandant, two postgraduate courses (one in medicine and one in surgery) will be offered at the U S Naval Hospital, St Albans, Long Island, during the month of October, 1948

These courses are intended to engender furtherance of interest in the Naval Reserve preparedness plan, and will feature as many medicomilitary subjects as possible in the allotted time Lecturers will be drawn from the Hospital's consultant and staff physicians, Army and Navy Medical Departments, Public Health Service, and outstanding civilian physicians

Participation of Naval Reservists will be u two classifications (1) Naval Reserve off (organized and/or volunteer) who request 14 d training duty with pay and allowance, and Naval Reserve officers who volunteer to give on two lectures, demonstrations, etc They receive appropriate-duty pay

Prior to arranging these postgraduate cou inquiries are requested from Naval Reserve offi who tentatively intend taking them These quiries may be addressed to Captain M Bro Federal Office Building, 90 Church Street, York 7, New York

New York University Inaugurates Series of Health Education Institutes

ANNOUNCEMENT has been made of the inauguration of a series of annual Health Education Institutes under the sponsorship of the School of Education, New York University The first of these Institutes to be held this summer from August 16 to September 3, 1948, under the Department of Physical Education and Health, School of Education, in cooperation with American Association for the Advancement of Science, the Research Council on Problems of Alcohol, and other national agencies, will be devoted to problems in alcohol education

The Alcohol Education Institute at New York University will be staffed by outstanding scientific authorities throughout the country, in addition to national leaders in education on the University faculty

These lecturers will include, among others, the following Dr Ralph S Banay, research ass ate, Department of Neurology, Columbia Uni sity, Dr I Jay Brightman, assistant direc Division of Medical Services, New York S Department of Health, Brigadier General Che R Brown of the Salvation Army, Dr Anto Carlson, professor emeritus of physiology, Uni sity of Chicago, Senator James E Gardner of state of Virginia, Dr H B Haag, professo pharmacology, dean of the Medical School of Medical College of Virginia, Mr Joseph Hi acting director, Research Council on Problems Alcohol, New York, Edward J McGoldrich, director, City of New York Bureau of Alcoh Therapy, Dr Mary Jane Sherfey, instructor psychiatry, Cornell University Medical Coll and Rev Alson J Smith, Roxbury Metho Church, Stamford, Connecticut

Cornell University Medical College Offers Graduate Instruction in Internal Medicin

CORNELL University Medical College is now offering graduate instruction in internal medicine and neurology The teaching facilities of the Second (Cornell) Medical Division, Bellevue Hospital, New York City, comprising 145 beds, are devoted exclusively to this work. The instructors are members of the faculty of Cornell University Medical College

The course is designed to give practical instruction in the subjects of internal medicine, neurology, and pathologic physiology The work consists of daily bedside study of patients on the medical and neurologic wards Each physician is assigned a series of patients and cooperates with the resident and attending staff in their care A limited number of men may obtain special training in cardiology, hematology, diabetes, endocrinology and gastrointestinal diseases in the special clinics of the Outpatient Department All students receive practical instruction in electrocardiography

The bedside teaching is supplemented by conferences each week to cover morbid anatomy, clinical medicine, gastroenterology, pulmonary disease, and the surgical aspects of medical problems

The teaching program is a continuous one physicians are admitted on the first of each mo as vacancies occur For any one individual, course is of either three months' or six mont duration The three months' course may incl six weeks of neurology and six weeks of medicine may be limited entirely to medicine The maxim number of physicians registered in the course at one time will be limited to 25

An examination is offered by the Department Medicine, Cornell University Medical College, the end of the course Successful completion of t examination and satisfactory ratings by individ tutors will be required of those who desire credit partial fulfillment of the requirements of American Board of Internal Medicine

For admission, each applicant is required submit a transcript of medical school record a information about hospital training and milit service

Inquiries and applications should be addressed Dr John E Deitrick, director, Second (Corne Medical Division, Bellevue Hospital, First Aven and Twenty-sixth Street, New York 16, New Yor

Cutter Laboratories Resumes Shipments

ANNOUNCEMENT that Cutter Laboratories, Berkeley, California, is ready to resume shipment of Cutter solutions from its Berkeley and branch warehouses was made Monday June 21 by Fred A Cutter, vice-president of the organization.

The full text of Mr Cutter's statement is as follows

We are now ready to resume shipment of Cutter solutions from our Berkeley and branch warehouses.

We wish we could tell you that the cause of the contamination is now definitely known. We cannot truthfully do so In the six weeks since we recalled our solutions, hundreds of thousands of flasks have been critically examined. Every piece of equipment and every instrument was meticulously checked. There was no evidence of equipment or instrument failure, and we could not definitely confirm closure failure or any other cause.

We can assure you, however, that not a single bottle which was clear on visual inspection has been found to be contaminated and that we will continue to do everthing in our power to assure the safety that has been the cornerstone of our existence and growth for over fifty years.

Conference of State Health Officers and Public Health Nurses Held

THE 44th annual conference of New York State health officers and public health nurses was held at Saratoga Springs from July 21 to 23 with a program planned to place emphasis on four general fields of public health interest tuberculosis control nutrition in public health, development of county health departments and health officers.

At the opening session with Dr Herman E. Hilleboe, State commissioner of health presiding, addresses were given by Dr Leonard Scheele, surgeon general of the U.S Public Health Service, and Dr Leo F Simpson, president of the Medical Society of the State of New York. Dr Austin M Brues, director of the biology division Argonne National Laboratory Chicago, also spoke on The Public Health Aspects of Total Body Irradiation.

Presiding officers speakers and topics discussed in the four sessions included

Tuberculosis—Dr William A Brumfield, deputy commissioner of health, presiding Mr William Steenken Jr, head of Trudeau Laboratory Trudeau, "The Role of the Laboratory in Tuberculosis Research Dr William Roommich, Minneapolis, Minnesota 'Analysis of Follow up in a City wide Chest X ray Survey, and Dr Walsh McDermott, New York Hospital, New York City, "Streptomycin—Its Present Status in Tuberculosis Treatment.

Nutrition—Dr Hilleboe presiding Dr Frederick J Stare department of nutrition, Harvard University School of Public Health Boston, 'Education in Nutrition for Public Health Personnel , Professor Leonard A. Maynard, director School of Nutrition Cornell University, Ithaca, 'Present Nutrition Research Trends and Their Application to Public Health, and Dr W H. Sebrell chief, Division of Physiology, U S Public Health Service, Washington, D C United States Public Health Service Program in Nutrition

County health departments—Dr Brumfield presiding Dr Harry S. Mustard commissioner of health, New York City Department of Health, County Health Departments—Past, Present, and Future', Dr Vlado A. Getting commissioner of public health Massachusetts Department of Public Health Boston "Functions of a County Health Department, and Dr Ernest L. Stebbins, professor of public health administration, School of Hygiene and Public Health, Johns Hopkins University Baltimore, Maryland, "What the County Health Department Does for the Community"

Health officers—Dr George E. Sanders, president, New York State Health Officers' Association presiding Dr Berwyn F Mattison, health commissioner Erie County Health Department, Buffalo Problems of Organizing a New County Health Department Dr C A Sargent, health commissioner Syracuse City Health Department, 'The Integration of School Health Services in the County Health Department Program', Dr Chester A Hicks, director of public health New Rochelle City Health Department, 'The Building of a City Health Department with the Help of State Aid Legislation, and Dr William A. Holla, health commissioner Westchester County Health Department, "Mental Hygiene Services as Part of a County Health Department.

Dr James R. Reuling Elected A.M.A Vice Speaker

DR. JAMES R. REULING, Bayside, treasurer of the Medical Society of the State of New York and delegate to the American Medical Association was elected vice-speaker of the A.M.A., at the 97th annual session held from June 21 to 25, in Chicago

Dr R. L. Sensenich, South Bend, Indiana, was installed as president of the A.M.A for the coming year and Dr Ernest Edward Irons, Chicago was chosen as president-elect.

Dr Irons will take office at the 1949 meeting, to be held in Atlantic City New Jersey, from June 6 to 10

The 1950 session will be held in San Francisco, and the 1951 session in Atlantic City the A.M.A. House of Delegates voted.

New Book on Tuberculosis Distributed

PROVISION of adequate personal service and relief for tuberculous families is discussed in a pamphlet written by Bailey B Burritt and recently published by the State Charities Aid Association State Committee on Tuberculosis and Public Health.

Entitled *Life, Death and Tuberculosis As Affected by the Standard of Living*, this new 16-page pamphlet emphasizes the importance of the human element in tuberculosis control and deals with specific health and welfare problems of tuberculous individuals and their families

In presenting his concepts for dealing with the tuberculous patient and his family, Mr Burritt shows the need for strengthening social and economic standards of living as an essential part of successful treatment of tuberculosis He further points out that a considerable number of patients leaving hospitals against advice and the number of patients with active tuberculosis still at large in the community are evidences of failure to secure the cooperation of patients and their families in protecting themselves and their community by treatment

The pamphlet makes specific suggestions for public health and public welfare officials and voluntary tuberculosis workers with regard to their cooperation in securing adequate personal service and relief for tuberculous families

New York Exhibitors Receive Awards at A M A Convention

SEVERAL certificates of merit and honorable mentions were received for scientific exhibits shown by New York State physicians at the 97th annual session of the American Medical Association, held in Chicago in June

In Group I, for exhibits of individual investigation, judged on the basis of orginality and excellence of presentation, certificates of merit were awarded to Dr Richard H Lyons, Syracuse University Medical School, for the exhibit, "Autonomic Blockade with Tetraethylammonium," and to Dr David Lehr, New York Medical College, Flower and Fifth Avenue Hospitals, New York City, for the exhibit on "Low Toxicity of Sulfonamide Combinations"

In Group I, honorable mentions were awarded to Dr Helen Ollendorff Curth, Columbia University College of Physicians and Surgeons, New York City, on "Cancer and Acanthosis Nigricans," and to Drs Irving S Wright, Charles D Marple, and Dorothy F Beck, Committee for the Evaluation of Anticoagulants in the Treatment of Coronary Occlusion with Myocardial Infarction, American Heart Association, New York City, on "Anticoagulants in the Treatment of Coronary Occlusion with Myocardial Infarction"

Awards in Group II, for exhibits which did not exemplify purely experimental studies, judged on the basis of excellence of presentation and correlation of facts, included honorable mentions to Dr Michael A Rubinstein, Montefiore Hospital, New York City, on "Multiple Myeloma—Its Relation to Leukemia," and to Drs John D Stewart, Sidney M Schaer, W H Potter, and Alfred J Massover, University of Buffalo School of Medicine, Buffalo, on "Management of Massively Bleeding Gastroduodenal Ulcer"

Public Health Officers Attend World Assembly

FIVE commissioned officers of the Public Health Service are included in the 17-member delegation from the United States to the first World Health Assembly which opened in Geneva, Switzerland, June 24

Chief delegate from the United States is Dr Thomas Parran, special consultant of the International Children's Emergency Fund of the United Nations and former Surgeon General of the Public Service

Alternate delegates to the Assembly include Dr James A Doull, chief of the Office of International Health Relations, and Dr H Van Zile Hyde, now on detail to the Department of State from the Public Health Service

Among the special advisers to the United States delegation are Miss Lucile Petry, chief, Division of Nursing, who will serve as consultant in the field of nursing, and Dr Morton Kramer, chief of information and research, Office of International Health Relations, adviser on relationships with the United Nations

State Broadens Occupational Therapy Program

EXTENSION of occupational therapy to all patients whom it can benefit in the 26 hospitals and schools of the New York State Department of Mental Hygiene has been made possible by the provision of 209 new positions, Dr Frederick MacCurdy, commissioner of mental hygiene, announced recently He added that the positions were available as of the first of June through funds recommended by Governor Dewey in his 1948-1949 budget and subsequently approved by the State Legislature

MEETINGS

FUTURE

Bureau of Social Hygiene, New York City Department of Health

A comprehensive series of lectures and demonstrations on the diagnosis, treatment and management of venereal diseases will start at the New York City Department of Health on Saturday morning September 18. There will be 14 weekly meetings presided over by experts in the various special fields of venereal disease control. Sessions will start at 10 30 A.M., and will be held in the second floor auditorium of the Health Department 125 Worth Street, New York City.

The schedule of lectures includes: September 18—'Practical Aspects of Immunity in Venereal Disease'; September 25—'Treatment of Gonorrhea'; October 2—'The Public Health Nurse's Part in the Venereal Disease Control Program' October 9—'Treatment of Early Syphilis'; October 16—'Late and Latent Syphilis' October 23—'Interviewing the Venereal Disease Patient' October 30—'Cardiovascular Syphilis' November 6—'Treatment of Neurosyphilis'; November 13—'Human Relations and the Venereal Disease Patient'; November 20—'Workmen's Compensation Aspects of Venereal Disease'; November 27—'Interpretation of Serologic Reports'; December 4—'Advances in the Treatment of Minor Venereal Disease' December 11— Syphilis in Pregnancy, and December 18—'Differential Diagnosis of Early Syphilis.

Central Association of Obstetricians and Gynecologists

The 16th annual meeting of the Central Association of Obstetricians and Gynecologists will be held September 23, 24, and 25 in Denver, Colorado Headquarters will be at the Shirley-Savoy Hotel. Further information may be obtained from Dr John I. Brewer secretary treasurer, 24 West Ohio Street, Chicago 10, Illinois.

National Committee for Mental Hygiene

The annual meeting of the National Committee for Mental Hygiene will be held November 3 and 4 at the Hotel Pennsylvania, New York City, with a program consisting of four scientific sessions during the morning and afternoon meetings, a business luncheon on the first day and the annual luncheon on the second day, at which the presentation of the Lasker Award will be made and the ten year national program for mental health discussed.

Further information may be obtained from the National Committee for Mental Hygiene, 1790 Broadway, New York 19, New York.

American Public Health Association

The 76th annual meeting of the American Public Health Association will take place from November 8 to 12 in Boston, Massachusetts. Representatives from all parts of the United States, from Canada, Cuba and Mexico, and from Latin American countries will attend. Delegates from Europe and Asia are also expected.

Meeting with the American Public Health Association will be many related organizations including American School Health Association, Association of Maternal and Child Health and Crippled Children's Directors, Association of Reserve Officers of the U S Public Health Service, Association of State and Territorial Health Officers, Conference of Municipal Public Health Engineers, Conference of Professors of Preventive Medicine Conference of State and Provincial Public Health Laboratory Directors, Conference of State Directors of Health Education, Council of State Directors of Public Health Nursing, National Committee of Health Council Executives and Public Health Cancer Association.

Further information may be obtained from the executive secretary Dr Reginald M Atwater 1790 Broadway New York 19, New York.

PERSONALITIES

Honored

Dr Robert Emery Brennan, director of surgery New York Polyclinic Medical School and Hospital who has been associated with the institution for many years, by the Board of Trustees who have named one of the operating rooms 'The Brennan Operating Room'' The late Dr DeWitt C Romaine by a bequest, in his sister's will, to Columbia University College of Physicians and Surgeons of $140 000 for medical research will be used to set up the Dr DeWitt C Romaine Fellowship to investigate diseases of the blood system and other medical problems.

Awarded

Dr George G Deaver professor of clinical rehabilitation and physical medicine at New York University College of Medicine and a member of the medical staff of the Institute of Rehabilitation and Physical Medicine of the New York University Bellevue Medical Center, the Medal for Merit by President Harry S Truman for his pioneer work in the field of rehabilitation Dr Frederick Lee Liebolt New York City attending surgeon and associate professor of orthopedic surgery at the New York Hospital-Cornell University Medical Center, the honorary degree of doctor of laws from the University of Arkansas.

Appointed

To emeritus status at Columbia University New York City, Dr William H McCastline, University medical officer emeritus, and Walter W Palmer, Bard professor emeritus of medicine.

Dr H. Houston Merritt former chief of the division of neuropsychiatry, Montefiore Hospital, New York City as professor of neurology and executive officer of the department of neurology of the Faculty of Medicine of Columbia University and as director of the neurological service and attending neurologist Neurological Institute, Presbyterian Hospital.

Dr Marjory J Nelson, chief medical inspector in the Mount Vernon public schools since 1944, as Barnard College physician, succeeding Dr Gulielma F Alsop, who retired June 20 after serving as college doctor for 35 years Dr Edward D Palmes, as assistant professor of preventive medicine, New York University College of Medicine, assigned to the Laboratory of Industrial Toxicology, initial unit of the Institute of Industrial Medicine

Dr John J Powers, Albany, as Albany Fire Department surgeon, to succeed Dr Francis B Maguire, resigned Dr Clyde L Randall, Buffalo, as a member of the State board of medical examiners, by the New York State Board of Regents, chief obstetrician at Buffalo General Hospital and professor of obstetrics at the University of Buffalo School of Medicine Dr Randall succeeds Dr James K. Quigley of Rochester, who resigned.

Elected

Dr Vincent E Fischer, Rochester, as first vice-president of the New York State Academy of General Practice Dr Clement J Hendron, Troy, as president of the Albany Medical College Alumni Association Dr Irwin I Lubowe, New York City, to Fellowship in the American College of Allergists

To membership in the Rensselaer Polytechnic Institute chapter of Sigma Xi, national honorary scientific society, Dr John C McClintock, Albany

Speakers

Dr Robert J Booher, assistant attending surgeon, Memorial Hospital for Cancer and Allied Diseases, and surgeon to the Pack Medical Group, New York City, at the annual meeting of the Newfoundland Medical Association held in St Johns, Newfoundland, from July 6 to 10, on "The Diagnosis and Surgical Management of Gastric Tumors" and "The Diagnosis and Management of Tumors of Soft Somatic Tissues" Dr Henry W Kaessler, Bronxville, pediatric consultant at Grasslands, Mount Vernon, and Lawrence Hospitals, on the Planned Parenthood broadcast over Station WFAS, White Plains, May 27

New Offices

Dr George Anderson, veteran of five years' service in the U S Navy Medical Corps, general practice in Ballston Spa Dr Mary A. Fyala, practice of pediatrics in Binghamton Dr Walter P Gage, who served during the war as colonel in charge of the surgical service of the 199th General Hospital, practice of gynecology and obstetrics in Cold Spring Dr Robert V Persson, of Newton Falls and Star Lake, general practice and practice of obstetrics in Potsdam Dr Alfred A Scharbius, practice of medicine and surgery in Smithtown Branch Dr Joseph Young, New York City, general practice in Lake Huntington Dr Clifford J Zeiss and his wife, Dr Ethel M Naughton, general practice in Valley Stream

---

OFT IN THE STILLY NIGHT

The public, according to complaints received by the American Medical Association, believes that it is not getting the service it requires from its doctors A particular grievance is the difficulty—on occasions the impossibility—of obtaining emergency medical service at night

For various reasons a reactionary attitude toward self-sacrifice has set in since the war The devotion to a common cause in those soul-trying years elevated many persons to a heroic state of mind Now, at least in this country, "We the people" are demanding the pay-off We want things material, and we want them now

The medical profession must bear its share of this failure to see eye to eye and clearly In too many phases of its work there has been an increasing divergence from the public interest rather than an improved cordialty in public relations The trend toward socialization has been a trend also toward the impersonalization of medical service

During the war, 60 per cent of the nation's physicians—and they comprised the older group—remained at home, assuming their absent colleagues' duties They were, on the whole, overworked, but, on the whole, as old-timers they accepted the responsibilities that appeared to them to be part of the obligations of a career of service Many of them now believe that others should bear the extra burden, and this is what the others seem unwilling to undertake The youngsters seem to have failed to acquire the idea that they have accepted a calling

If an obligation implicit in the practice of medicine now fails of spontaneous fulfillment, however, some organized measures must be taken to provide what is lacking The American Medical Association suggests that county medical societies or urban groups maintain telephone exchanges that will accept the responsibility for locating physicians available for emergency calls

The majority of the older practitioners have led lives so organized that they were never, year after year, "off call" without a substitute constantly available

It is one of the responsibilities that those who care for the sick have accepted and must continue to accept Those for whom they care must never be abandoned —*The New England Journal of Medicine, May 6, 1948*

WOMAN'S AUXILIARY

TO THE MEDICAL SOCIETY OF THE STATE OF NEW YORK

COUNTY NEWS

Allegany County

Mrs. E. Stanley Webster, Friendship, was re-elected president of the Auxiliary to the Allegany County Medical Society, at a meeting held in May at the St. James Hotel, Cuba. Also re-elected to office were Mrs. Loren Bly, Cuba vice-president, and Mrs. E. W Briggs, Wellsville, secretary treasurer

At the last meeting of the group, held July 8 in Cuba, plans were made for a charity card party to be held in September at the Bolivar Country Club The Auxiliary's nursing scholarship fund will benefit.

Broome County

At the annual meeting of the Broome County Auxiliary held in June at Lawson s Town House, Binghamton, Mrs Windsor R. Smith was re-elected president for the coming year In addition to the election of officers, reports of the convention were made, and yearly reports of committees were mimeographed and distributed to members. A luncheon was held in conjunction with the meeting.

A report was given on a visit of several members at a meeting of the Onondaga County Auxiliary, in Syracuse.

The group will offer a nursing scholarship fund this fall to a Broome County applicant.

Columbia County

Members of the 1948 graduating class of the School of Nursing of the Hudson City Hospital and Miss Helena Klassen, director of nursing at the hospital, were guests of honor at a luncheon of the Columbia County Auxiliary held June 1 in connection with the annual meeting in Hudson

Mrs. Ralph F Spencer, president, was in charge of the business meeting which preceded the luncheon.

Erie County

Mrs. Ralph Upson Snyder took office as president of the Erie County Auxiliary, succeeding Mrs Arthur Lawton Bennett, at a luncheon meeting, May 25 in Buffalo Other new officers are Mrs. Clarence J Durshordwe president-elect Mrs Roland B. Carr, first vice-president Mrs. Elmer A. D Clarke second vice-president Mrs. Charles R. Borzillieri Jr , recording secretary Mrs. George F Marquis, corresponding secretary Mrs Victor L. Cohen, treasurer, and Mrs. John D Naples, director for three years

Mrs. Carr, delegate to the State convention gave a detailed report of the meetings and the chairmen of standing committees gave their annual reports.

At a recent meeting of the Chautauqua County Auxiliary Mrs. Bennett Mrs. Durshordwe and Mrs. Lee R. Sanborn, editor of *The Distaff* publication of the State Auxiliary, were guests, giving help and suggestions for various projects.

On June 16 Mrs. Upson, the new president, held a business meeting, at which Mrs. Norman F Grasor, program chairman, announced plans for a benefit party in October for the project fund. The Auxiliary's project will be the maintenance of two scholarship loans for student nurses.

Fulton County

Under the direction of Mrs. Herbert Hageman, retiring president, the Fulton County Auxiliary had an active year, with a guest speaker for each monthly meeting These included Mrs. Thomas E. Bullard Schuylerville, who spoke on Fifty Years a Doctor's Wife and a British exchange teacher, Miss R. E. Ross, who spoke on the practice of medicine in England and the panel system of medical practice.

As an Auxiliary project, medical supplies valued at $260 were collected for shipment overseas. Another collection of medical supplies is planned for the fall.

The summer meeting of the Auxiliary will include a picnic at the summer camp of Mrs. Harriet Pannaci, Caroga Lake.

Mrs. R. E Kunkel is the new president of the group

Kings County

The first meeting of the new year will be called by the president of the Kings County Auxiliary, Mrs. Charles E Scofield on September 14 No summer meetings will be held

A bridge and food sale is planned for Tuesday October 26 the committee has announced.

Madison County

Members of the Madison County Auxiliary were guests recently at the last meeting of the Onondaga County Auxiliary, in Syracuse, at which Mrs Edgar M Neptune, State president, was principal speaker

No meetings of the group are planned for the summer, but an outing will be held, to include a trip and luncheon within driving distance of the members homes.

Mrs. E. W Carpenter is president of the Madison County Auxiliary

Oneida County

The Oneida County Auxiliary held its annual meeting and election of officers on May 25, winding up the activities for the year until September when plans for the next year's program will be made. Mrs Arthur Gaffney is president of the group

The project of supplying books to the Oneida County Hospital is continuing throughout the summer and the work to increase the nursing scholarship fund is continuing the group reports.

Orange County

With 30 members present, members of the Orange County Auxiliary met on June 16 for a luncheon meeting at the home of Mrs. G Otto Pobe Port Jervis. The business meeting was conducted by Mrs. John Ross, Middletown president. The Auxiliary agreed to assist the County Medical

Society in October when it will be host to the First District Branch meeting, in Newburgh

Program for the June meeting was a fashion show, presented by several members, demonstrating "What the well-dressed doctor's wife should and should not wear"

At the May meeting of the executive committee, held at the Orange County Golf Club with Mrs Ross as hostess, chairmen of all standing committees and members of special committees were appointed

The nurse scholarship committee reported that the Auxiliary is offering each year two scholarship loans, not exceeding $100 a year, to Orange County girls who "shall satisfy the scholarship committee as to requirements and character references and who shall have a letter from an approved New York State school of nursing" Mrs W Hasbrouck Snyder, Newburgh, is chairman of the scholarship fund committee The scholarships were awarded July 15 for the fall classes

Queens County

The Queens County Auxiliary held the last stated meeting of the season on May 25, with Mrs Daniel Swan, president, in charge A report of the State convention was given by Mrs Samuel Klein, president-elect, including the information that three past presidents of the Queens County Auxiliary have been elected to State Auxiliary offices—Mrs William LaValle, president-elect, Mrs Thomas D'Angelo, recording secretary, and Mrs Joseph Hallinan, archives

Mrs Ezra Wolff reported a profit of over $1,000 from the variety amateur show held May 15 The proceeds will be used for the various hospitals Plans for a dinner dance on November 13 at the North Hills Country Club were made Guest speaker at the May meeting was Mrs Ruth Kistner, who gave a talk on "Flower Arrangements"

Rensselaer County

Officers for the coming year were elected at the annual luncheon meeting of the Rensselaer County Auxiliary, held May 12 in Troy Mrs Wilbur H. Caney will serve as president, and other officers are Mrs Samuel J Werlin, president-elect, Mrs Clement J Hendron, first vice-president, Mrs Charles Bessey, second vice-president, Mrs Henry F Albrecht, Jr, recording secretary, Mrs Warren St John, corresponding secretary, Mrs David Tomlinson, assistant corresponding secretary, Mrs J Clarke Burke, treasurer, and Mrs Sidney Lewis, assistant treasurer

Named to the Board of Directors were Mrs John J Quinlan, retiring president, for three years, Mrs Nicholas F Brignola, two years, Mrs Victor C Jacobsen and Mrs Sherman W MacIlmoyl, one year

Richmond County

Meeting on June 23 at the Richmond Memorial Hospital, members of the Richmond County Auxiliary elected officers for the coming year, including Mrs Joseph F Worthen, president, and Mrs John Goller, president-elect

Mrs Edward Klauber, Mrs Leif G Jensen, Mrs Goller, and Mrs Worthen gave a report on the State convention, and annual reports were presented by committee chairmen and officers

In her talk to the group, Mrs Worthen stressed the three main purposes of the Auxiliary "cooperation with the Medical Society, to act as liaison between the medical profession and the public, and to give special attention to legislation, public health, and public welfare"

The next meeting of the Auxiliary will be held September 21

Saratoga County

A picnic, to which all doctors' wives of Saratoga County were invited, and a final meeting of the summer was held in July by members of the Saratoga County Auxiliary at the Homestead Sanatorium, Middlegrove

Mrs T J Goodfellow is president of the group

Seneca County

Activities of the Seneca County Auxiliary, of which Mrs Robert Gibbs is president, have included two meetings in May, the formation of a constitution, and a joint picnic for doctors and their wives, held July 11 at Cayuga Lake

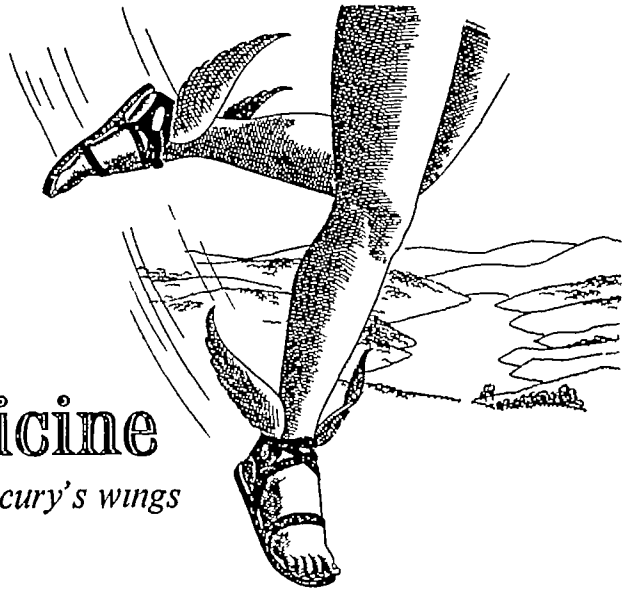
Tompkins County

Members of the Tompkins County Auxiliary held their annual membership tea at the Biggs Hospital, Ithaca, on June 15, with Mrs Edgar M Neptune, State president, and four members of the Onondaga County Auxiliary, as guests

Also present as guests were the president and four members of the Schuyler County Auxiliary

At the May meeting of the group, held in the Cornell Infirmary Library with 24 members present, Mrs Norman S Moore reported on the State convention and plans for the year's work were made.

Warren County



Meeting with the Warren County Medical Society, the Warren County Auxiliary had a joint dinner meeting at the Glens Falls Country Club in May, at which all officers were re-elected for the coming year Mrs E J Fitzgerald is president

Wayne County

Mrs Edgar M Neptune, State Auxiliary president, was guest speaker at a luncheon meeting of the Wayne County Auxiliary, held at Williamson in June The theme of her address centered around the possible organization of an international world health group Mrs Neil Paul, vice-president of the Onondaga County Auxiliary, spoke on "The Responsibilities of Doctors' Wives," stressing the importance of one hundred per cent membership in the Wayne County Auxiliary Mrs Charles Gruen, Lyons, spoke on "Social Responsibilities of Doctors' Wives in Small Communities" and told how six new county auxiliaries have been organized during the past year

Mrs Charles Steyaart, recently elected president, was in charge of the meeting Other officers include Mrs James Arseneau, president-elect, Mrs Myron Carmer, vice-president, Mrs George Pasco, secretary, and Mrs Norbert Menuhin, treasurer

A joint meeting of the Wayne County Medical Society and the Auxiliary has been scheduled for August

Medicine

wears Mercury's wings

Contemporary Medicine moves forward at an astonishing pace

Within the span of one decade 1937 1947, the annual number of deaths from acute respiratory diseases declined by *70%* In 1947 the collective mortality rate for the communicable diseases of childhood was only *one-sixth* that of 1937

Contemporary Medicine is a story of progress achieved through cooperative effort a story of enlightened teamwork on the part of the clinician the research worker and Pharmacy as exemplified in the modern pharmaceutical laboratory

At Bristol Laboratories, we recognize the privilege of sharing in this cooperative effort Success in discharging this trust is measured by the increasing thousands of physicians who specify Bristol.

REVIEWED

History of the American Medical Association, 1847 to 1947 By Morris Fishbein, M D With "The Biographies of the Presidents of the Association" By Walter L Bierring, M D Octavo of 1,220 pages, illustrated Philadelphia, W B Saunders Company, 1947 Cloth, $10

Dr Fishbein has edited a handsome history of the American Medical Association which runs into some 1,200-odd pages There is a wealth of information about the early days of the Association, biographies of past presidents, and information regarding the councils, bureaus, and publications of the organization There is a miscellaneous collection of appendices and a complete index

A work of this sort might have been either very dull or very highly controversial in view of the present conflicting opinions in the profession regarding the Association's status Most of the material turns out to be extremely interesting The biographies of the presidents show the wide variety of men to whom the fortunes of the Association have been entrusted On the whole, they seem to have been an unusually outstanding group

The history can be recommended to those, and there should be many, who will want to consult a history of this body It will not satisfy those who look for a statement of broad philosophic principles or words of wisdom or vision concerning the possible future role of the Association in American society However, this is scarcely the purpose of a history, and a very satisfactory one it is

[Continued from page 1752]

A Manual of the Common Contagious Diseases By Philip Moen Stimson, M D Fourth edition Duodecimo of 503 pages, illustrated Philadelphia, Lea & Febiger, 1947 Cloth, $4.00

Dr Stimson has been teaching the common contagious diseases to medical students for the past twenty-five years Long experience has given him the insight required to write a clear, concise, complete, easily readable description of these diseases No effort seems imposed in obtaining all the essential elements, all that are new The book is an authoritative text for medical and nursing students and a helpful reference for practitioners

KENNETH G JENNINGS

Clinical Practice in Infectious Diseases. For Students, Practitioners and Medical Officers By E H R Harries, M D , and M Mitman, M D Third edition Octavo of 679 pages, illustrated Baltimore, Williams & Wilkins Company, 1947 Cloth, $6 00

Perhaps the strongest impression an American reviewer gets of this book is that fundamental English virtue, thoroughness The subject is well covered and the chief difference between English practice and American would seem to be hospital arrangements It is interesting to observe, apparently from traditional persistence of Victorian reserve, that "the axilla or groin are the sites usually employed" for taking temperatures The authors also find it necessary to say that "sterile syringes and needles must be used " Nevertheless, they are well up in their therapy, including the sulfonamides and penicillin Even streptomycin is mentioned, though it was hardly in use here when the book was written

W D LUDLUM, SR.

Overcoming Stammering By Charles Pellman Octavo of 160 pages New York, Beechhurst Press, 1947 Cloth, $3 00

The author of this small book discusses some of the theories of stuttering One chapter is on correction of stammering and one on how to help the child overcome stammering A statement on the flap of the book is to the effect that the author presents a fresh point of view in that the treatment of stammering is based upon the physiology of speech and proper mental hygiene, rather than the functioning of the breathing apparatus This is like tilting with wind mills, since no one today regards stuttering as being due to a malfunction of the breathing apparatus

I W KARLIN

Surgical Pathology By William Boyd, M D Sixth edition Octavo of 858 pages, illustrated Philadelphia, W B Saunders Company, 1947 Cloth, $10

The new edition of this classic book on *Surgical Pathology* is noteworthy for its section on developments in the surgery of heart disease A most welcome amendment deals with the pathology of backache due to fibrositis This book needs no recommendation Every surgeon and internist should own and refer to a copy regularly

ANDREW BABEY

Developmental Diagnosis Normal and Abnormal Child Development. Clinical Methods and Pediatric Applications. By Arnold Gesell, M D , and Catherine S Amatruda, M D Second edition Octavo of 496 pages, illustrated Philadelphia, Blakiston Co , 1947 Cloth, $7 50

Child growth and development has become an increasingly absorbing topic Those who are called upon to aid parents in rearing their children must take cognizance not only of physical well-being but of mental status as well Too little time is often given to proper evaluation of the child's behavior patterns Diagnostic problems involving the Rh factor, prenatal rubella, congenital anomalies, cerebral injuries, blindness, deafness, etc , make the book a valuable addition to an office library

THURMAN B GIVAN

The Years After Fifty By Wingate M Johnson, M D Large duodecimo of 153 pages New York, Whittlesey House, 1947 $2 00

To prepare for "The Years After 50" this interesting volume should be read, of course, by those who have not yet reached that age It is delightful reading and for the intelligent laymen most instructive Two chapters are especially recommended, the one on "Blood Pressure, High and Low," and the other on "Diseases of the Heart and Blood Vessels " The frequent tactless handling of hypertensive cases by many doctors has, in the words of an eminent clinician, "done mankind more harm than good "

Another chapter recommended to the doctor as well as the laymen is the one on "Preparing for Old Age " What a wealth of important suggestions it contains! The reviewer is convinced it will teach one how to be happy while growing old

S R. BLATTEIS

Kompendium der Parasitschen Würmer im Menschen By Dr Hans A Kreis Octavo of 136 pages, illustrated Basel, Switzerland, Benno Schwabe & Co , 1947 Cloth, 10 fr

The increase of worm infestations in the Swiss population during the last war has induced the author to write this book It contains a complete, although short, description of the natural history of the parasites which are endemic in Switzerland The paper, the print, and the pictures throughout the book are remarkably good

MAX G BERLINER

Peripheral Vascular Diseases (Angiology) By Saul S Samuels, M D Second edition Octavo of 85 pages New York, Oxford University Press, 1947 Cloth, $2 50 (Oxford Medical Outline Series)

This book covers both the medical and surgical aspects of angiology It is presented in outline form, with blank pages for the convenience of taking notes In his preface, the author stresses the fact that a specialist in peripheral vascular diseases should be a surgeon as well as an internist This, however, is argumentative The author presents again and again the different tests for peripheral vascular diseases He also discusses the anatomy of the autonomic nervous system This book, on the whole, can be very well recommended for quick reference, especially as to treatment

VINCENT ANNUNZIATA

Histopathology of the Ear, Nose and Throat. By Andrew A Eggston, M D , and Dorothy Wolff, Ph.D Quarto of 1,080 pages, illustrated Baltimore, Williams & Wilkins Co , 1947 Cloth, $18

In this lone, magnificent work not only the histopathology but embryology, physiology, anatomy, and often even comparative zoology of the part con-

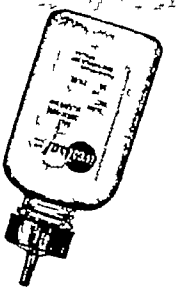
salt substitute that tastes
exactly like table salt

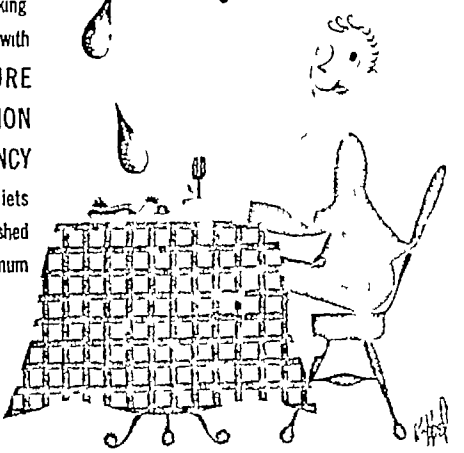
that makes food taste exactly like
food seasoned with salt
no bitter, disagreeable taste.



WESTSAL—in convenient liquid form—can
be used as safely and freely as salt
at the table, in cooking and baking
WESTSAL enables patients with

CONGESTIVE HEART FAILURE
HYPERTENSION
TOXEMIAS of PREGNANCY

1. to adhere faithfully to low salt diets
2. enjoy food and be adequately nourished
3. keep harmful sodium intake at a minimum



WESTSAL is a solution of lithium chloride with small amounts of citric acid and potassium iodide (iodizing traces)
●Bottles of 2¼ oz.

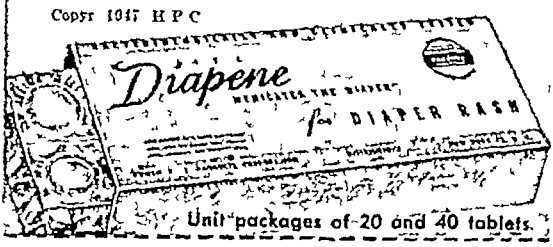
"MEDICATES THE DIAPER"



The cause of *ammonia dermatitis* is ammonia liberated by bacterial decomposition of urinary urea DIAPENE — impregnated into the laundered diaper merely by rinsing — checks the particular bacillus which releases ammonia from the baby's urine DIAPENE, therefore, prevents and relieves diaper rash **by eliminating the cause**

IMPORTANT —DIAPENE is as basically necessary as baby oil, powder or ointment, because *chafing, prickly heat,* allergy rashes, etc, are often aggravated by ammoniacal urine DIAPENE is *a prophylactic MUST* for every baby!

For prevention, medicate only 'night' diapers
For treatment, medicate all the diapers
One tablet to 2 qts water, a rinse for 6 diapers

Bacteriologically and Clinically Tested for Doctor's Use —

Copyr 1947 H P C

Unit packages of 20 and 40 tablets.

HOMEMAKERS' PRODUCTS CORPORATION NS-14
380 Second Ave, New York 10, N Y

Please send me, without cost, literature and samples of DIAPENE to eliminate cause of diaper rash (*ammonia dermatitis*)

Vodisan

BRAND OF HYCLOMANE SOLUSALVE

Vodust

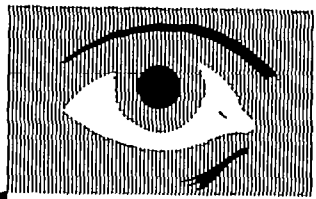
BRAND OF HYCLOBORIC DUSTING POWDER

treatment for

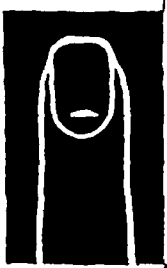
Athlete's Foot

The increasing prevalence of dermatophytosis and other fungous infection of the skin during the hot summer months will bring more urgent pleas for relief

Vodisan*-Vodust**—the "around-the clock" treatment for athlete's foot—contain Hyclomane, the fungicide successfully used by the armed forces in the jungles of the South Pacific to destroy fungous rot on fabrics. Hyclomane in a special bland base dissolves in the wound secretions and exerts its potent fungicidal action in the cracks, fissures, and beneath the involved skin Its strong bactericidal action combats secondary infections which frequently complicate dermatophytosis



*Brand of Hyclomane Solusalve
**Brand of Hycloboric Dusting Powder



DAY AND NIGHT TREATMENT

Vodisan* applied at night and Vodust** dusted on the feet and between the toes in the morning exert "around the-clock" fungicidal action and minimize the danger of reinfection Extensive research and clinical use has proven the effectiveness of this Day Night treatment You can prescribe Vodisan Vodust with confidence

HEADQUARTERS

Wherever the Authorized Camp Service sign appears, you can depend upon the dealer as the "Headquarters" for Camp Anatomical Supports in that community Whether it be a special Camp Department in one of the large metropolitan department stores, or whether it be a small neighborhood store, specialty shop or surgical supply dealer anywhere in the world — you can send your patients there with complete confidence in two things (1) Your prescriptions will be carefully executed by expert fitters trained by the Camp organization to fill such prescriptions, and (2) there will always be (with rare exceptions) adequate stock on hand to fill your order *immediately*

Merchants find it is good business to be thus equipped to render this service to their customers — quickly, intelligently and accurately — as you, the doctor, demand it And doctors find it often saves their patients days and weeks of unnecessary pain and discomfort to send them directly to "Headquarters" for their anatomical support. Camp Supports, of course, are sold and fitted *only* through reputable stores — they are never sold by door-to-door canvassers

THE LINING OF THE GALL BLADDER

Normal Gall Bladder

Chronically Inflamed Gall Bladder

The normal gall bladder lining is a soft, delicate mucosal layer characterized by numerous minute pockets over its surface When inflamed it becomes thickened and coarse to a variable degree Biliary stasis is believed to be a major factor in inciting a catarrhal inflammation which, with secondary infection, may progress to a more virulent cholecystitis, with or without cholelithiasis

DEHYDROCHOLIC ACID *ARMOUR* is a powerful hydrocholagogue and choleretic It induces a copious outflow of thin, watery bile which is low in total solids In effect, a physiologic "flushing-out" of the biliary tract It is indicated in the medical management of chronic gall bladder cases with or without stones, provided there is no actual obstruction It is of value also in functional hepatic insufficiency, in liver poisoning, by drugs or anesthetics, in cirrhosis, and in chronic passive congestion of the liver It is *contra-indicated* in *obstructive* jaundice

Supplied in 3¾ grain tablets—bottles of 50, 100, 500 Dosage 1 to 3 tablets t i d with meals. Literature on request

Dehydrocholic Acid

Time and tide

in modern diuretic therapy

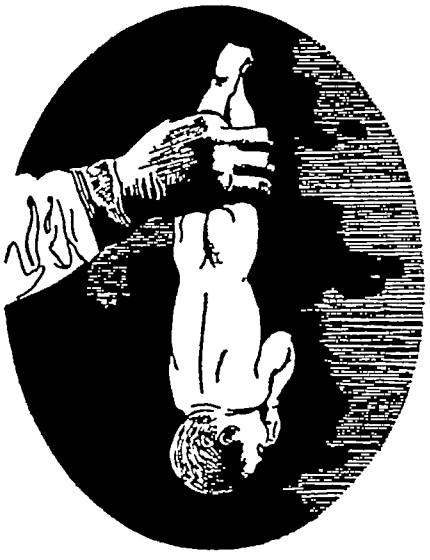
Timely injections of MERCUHYDRIN combat the rising tides of edematous fluid and check recurrences by mobilizing water binding sodium[1] and stimulating its urinary excretion.

MERCUHYDRIN facilitates the recommended frequent-dosage schedules[2] of modern diuretic therapy. Convenience, high local tolerance[3, 4] and increased safety of the intramuscular route[5] foster the maintenance of a relatively constant level of body fluid by repeated injections[6] thus sparing patients the distressing consequences of intermittent massive diuresis.

Prompt inauguration of MERCUHYDRIN diuresis in cardiac patients exhibiting nocturnal dyspnea, orthopnea, pulmonary râles, cardiac asthma and insomnia relieves discomfort and prolongs life.[6]

MERCUHYDRIN®

well tolerated locally, a diuretic of choice



Administration prior to or concurrently with digitalization avoids driving the faltering heart against an accumulated fluid burden and prevents the overdigitalization which may occur when postponed diuretic therapy mobilizes previously administered cardioactive glycosides from edema fluid.[6]

DOSAGE: 1 cc. or 2 cc. intramuscularly or intravenously, given daily or as indicated, until a weight plateau is attained. Subsequently the interval between injections is prolonged to determine the maximum period permitted to intervene between maintenance injections.

PACKAGING: MERCUHYDRIN (mersalluride sodium) is available in 1 cc. and 2 cc. ampuls.

World Health and World Economy

Recently, five more nations—Brazil, Bulgaria, France, Romania, and the United States of America—officially accepted the constitution of the World Health Organization. This makes a total of 43 countries which have formally joined WHO, including 33 UN members and ten nonmembers Several other nations are now taking final steps toward ratification, among them the Dominican Republic, Pakistan, and Venezuela

The first World Health Assembly was held at Geneva, Switzerland, on June 24 of this year with nearly all nations of the world expected to attend through their representatives. The significance of this first assembly to the furtherance of world health and the eventual improvement of world economy can scarcely be comprehended at this time Dr A. Stampas, chairman of the WHO interim commission said

> The principal task of the Assembly is to secure international agreement on the best means of applying available knowledge and resources to the prevention of avoidable suffering and the raising of standards of health [1]

It seems obvious that, if all the resources of the health sciences were made globally effective by concerted, positive action on the part of the nations of the earth, the effect, in time, of such a program would surely be a stimulus to productive effort the like of which has never been seen While the initial plan contemplates concerted international attack on four fronts, malaria, maternal and child health, venereal diseases, and tuberculosis, activity for 1949 is suggested in 44 medical, medicosocial and other related fields

Progress is reported in the work on a universal pharmacopoeia The Expert Committee on the Unification of Pharmacopoeias made several important decisions and agreed, among other things, that proprietary drugs should be included in the international pharmacopoeia. It was also decided that a

[1] W.H.O Newsletter June 15 1948, Vol. II Number 6

list of usual and maximal doses should be prepared and advice from the medical profession sought before submission to the next meeting of the Committee The question of doses for children was raised, but the Committee felt that for the moment no action should be taken In addition, it was agreed in the case of injection to specify the route of administration At this session, the second of its kind, further progress was achieved toward setting up a unified system of nomenclature to provide that the same name should represent a drug of the same potency and composition in all countries

Thus, standardization on a universal basis commences slowly but surely This unification is fundamental in the program of positive action which the WHO is initiating In discussing the liberation of men everywhere from the overhanging dread of preventable disease, President Truman, as he signed the joint resolution of the Congress of the United States, said

> In doing so, through the World Health Organization we once again testify to our faith in the United Nations as the great instrument for reaching those goals of common understanding and mutual helpfulness among nations which alone can lead to peace and security for all peoples

At present about three hundred million persons are stricken with malaria each year Of these, approximately three million die, and millions more are left mentally and physically deteriorated The latter suffer from decreased working efficiency and so contribute to the world's acute food shortage

The proposed WHO program for 1949 in the field of maternity and child health aims at reducing the large number of preventable deaths among infants and mothers and controlling the high incidence of communicable and other preventable diseases among children Governments would be assisted to develop facilities and services for adequate maternity care and to give infants the best possible chance of survival through normal physical development, mental and emotional health, and freedom from preventable disease To help achieve these aims, it is proposed that the following studies be initiated in 1949 causes and methods of reducing maternal, infant, and childhood morbidity and mortality, child guidance and the mental health of children, and the social aspects of the problem

Each year almost fifty million people suffer from tuberculosis Of these, about five million die The Interim Commission points to these high morbidity and mortality rates and to the rapidly rising graph of tuberculosis cases in many parts of the world as added reasons for the imperative need of an international tuberculosis control program

Increase of incidence of venereal diseases because of the war, deterioration of control measures in the postwar period, and speedy international travel are among the factors that make an international control program imperative Added reasons given by the Interim Commission are the record of effective international cooperation in this field and the availability of new technics and therapeutic agents not yet fully exploited

The recommended plan, which places special emphasis on syphilis, will give governments assistance in national and local control based on modern scientific measures and will promote widest and most effective use of new drugs and improved technics of control between nations

Recognizing that the newborn World Health Organization could not possibly develop and initiate programs for all the important health matters requiring international action, the Interim Commission proposes that the main field of activity in 1949 be limited to malaria, maternal and child health, tuberculosis, and venereal diseases However, programs are also outlined for a number of other global health problems with recommendations for particular attention to alcoholism, drug addiction, hygiene of seafarers, influenza, nursing, nutrition, rural hygiene, and schistosomiasis

Current Editorial Comment

Wanted by the FBI. We are glad to cooperate with the Federal Bureau of In-

vestigation in printing the following announcement concerning a man who has been defrauding physicians and hospitals, and who may appear in this area. We suggest that New York State physicians read the announcement carefully, since this fugitive may approach any one

Hugo Bob Hubsch, with aliases Robert C Glass, R. C Harris, Hogo Hobsch, Louis S Miller, is being sought by the Federal Bureau of Investigation. On November 7, 1945 a Federal Grand Jury at Jackson Mississippi, returned an indictment charging this man with a violation of the National Stolen Property Act. He is charged with another violation of the National Stolen Property Act in a complaint filed with a U S Commissioner at Birmingham, Alabama, on June 7, 1948 This individual has defrauded numerous physicians and hospitals in Eastern and Southeastern sections of the United States during the past few months through the medium of fraudulent checks

Investigation has revealed that Hubsch has a chronic kidney ailment, and it has recently been ascertained that he has a large kidney stone in the right ureter about four inches below the kidney This condition has caused local inflammation which, at varying intervals, results in almost unbearable pain. He has been advised that it would be necessary for him to undergo major surgery for the removal of the stone in the near future, and until that surgery is performed he will need frequent, if not continuous, medical attention.

This fugitive moves about rapidly in that section of the United States which is east of the Mississippi, and recently he has given numerous physicians and hospitals fraudulent checks in return for treatments, hospitalization, sedatives, and narcotic prescriptions.

The following is a composite description of Hugo Bob Hubsch age, about 52, claims to have been born in Budapest, Hungary, November 4, 1895, height, about 5 feet, six inches, weight, 140 to 170 pounds hair, dark brown, graying, eyes, brown, build, medium, race, white, nationality, believed to be naturalized American, occupations, laborer, pharmacist, scars and marks, left arm partially paralyzed, needle scars on both arms, large scars above each hip resulting from kidney operations, shrapnel scars and two bullet scars on abdomen, bridge in upper front teeth, characteristics, long nose, stooped posture.

Anyone having information concerning the whereabouts of this fugitive should immediately notify the nearest office of the Federal Bureau of Investigation or your local law enforcement agency

The President's Page

The War Memorial

In this issue I would like to make a few remarks on a subject dear to my heart

From ancient times, honor has been accorded warriors who have fallen on the battlefield Huge monuments, giant statues, towering obelisks, these in cities and towns all over the world mark the deeds of the heroes of bygone and present days, magnificent memorials to their sacrifices

To commemorate the heroism of the thirty-two members of the Medical Society of the State of New York who were killed in action, died of wounds, or of disease incurred in service during World War II, a war memorial has been established by the Society, but a living, dynamic memorial, a mark of honor for these medical officers who did not return We can be proud of our Society's plans for this, plans which will do just honor to our dead by establishing provisions for the education of the living

Although for generations there has been talk of peace, talk of mankind living together in friendly relations with all nations and all peoples, peace in our time is yet to come If, however, we are to attain our goal of world amity, we must concentrate on the future, on our children and youth who will make the important decisions of tomorrow What better memorial, then, for those from our Society who gave their lives in the last great conflict than a plan which will provide education for their children?

The role of the physician in time of war is an important one Our profession looked upon it as a challenge and an opportunity, and faced it in a glorious manner We can ever point with pride to our record

Following the appointment of our Committee on the War Memorial, a detailed survey was made of the families of these medical officers, of their dependent children, and of their present and future education needs At this year's session of the House of Delegates, a plan was adopted whereby we, as a Society, will honor these members by providing financial aid for advanced education of their sons and daughters Fifty-eight, including thirty boys and twenty-eight girls, varying in age from four to twenty-four, are included in the listing For these we plan to contribute the sum of $600 a year when they begin their advanced education It is a sum which will not cover all expenses, but which will help with the costs and make possible college and medical school training which might otherwise have to be abandoned We may be able to enrich the medical profession of the future by thus facilitating training and education for these children of our members who served and died bravely as medical officers during the war

To create the fund for this War Memorial, each of you is assessed a small sum, $12, to be contributed before the end of this year, through your County Society, in the same manner as your regular dues Since several of the young people are ready this year to begin their higher education, it is important that our War Memorial Fund be established and ready to function at once

I am sure that we, as individuals and as associates of these whom we honor, can feel honored ourselves at this opportunity to take part in a truly living memorial, a commemoration of war heroes that will endure for many years To have a part, even though a small one, in contributing to the education of these young people is a consoling thought They will help light up their generations, and will cast their beneficent influence on their successors It is a species of immortality for us to do so

I am proud to serve as President of a group which has agreed upon such a project

LEO F SIMPSON, M.D

SOME NEWER ASPECTS OF PROTEIN METABOLISM

I Résumé of Experimental Data

DAVID SCHWIMMER, M D , and THOMAS H McGAVACK, M.D , New York City

(From the New York Medical College and Metropolitan Hospital)

THE recent war, with its military requirements and its sequel of underfed populations, has focused attention on the need for greater knowledge in the field of nutrition This has applied particularly to the problem of protein metabolism in the presence of limited intakes of calories and water

An efficient utilization of ingested proteins is essential for the proper protection and replacement of vital body tissues This is true whether the loss of protein nitrogen is occasioned by normal "wear and tear," or whether it is due to abnormal situations such as burns, hemorrhages, fractures, surgical procedures, fevers, or toxic factors. If not enough calories are fed to meet the current energy requirements, then the ingested protein is perforce burned for energy This implies that there will be no replacement of tissue proteins, or, more disastrous, there may even be a raiding of bodily protein for energy needs if the caloric deficit is very great

If, in addition to insufficient calories, the intake of water is limited, there will be a tendency to dehydration because the increased solute load raises the obligatory urinary volume needed to excrete the nitrogenous end products

Our own specific interest in this field arose with the Army Quartermaster's wartime quest for an improved ration for air force life rafts It was felt that the standard 100 Gm carbohydrate ration could be improved by supplementation with protein, provided that the objections we have already mentioned could be overcome. That protein might be utilized for other than energy production under conditions of privation was indicated by the animal studies of Swanson and of Allison, of Iowa State College and Rutgers University, respectively They demonstrated that the feeding of egg protein produced a definite lowering of the urinary excretion of nitrogen with a consequent improvement in nitrogen balance and a decrease in urinary volume. These investigators also found that supplementation of the diet with the amino acid d-l methionine further improved the utilization of nitrogen in the same directions

Our projected task in early 1945 was accordingly to check and corroborate these findings in human beings, then to transpose them quickly into specifications for a new life raft ration. The results in our earlier studies proved so interesting and delineated so many important unanswered questions that a long range program of experimentation was evolved The objective was to investigate survival rations as a whole with specific attention paid to the basic physiologic mechanisms operative during privation.

We have been unusually fortunate at the New York Medical College, Metropolitan Hospital Research Unit on Welfare Island, in having large numbers of excellent subjects capable of being observed over prolonged periods in a closed hospital ward made available to us During the past three and one-half years, we have studied the effects of 55 low calorie diets in over 200 human volunteers The latter have included both conscientious objectors and Army enlisted men

The general pattern of each experimental run has included three periods

1 Control Period (seven to ten days) subjects fed full complement of food and water

2 Deprivation Period (ten to thirty days) subjects fed specially prepared ration and specified amounts of water

3 Recovery Period (five to ten days) subjects fed gradually increasing amounts of food and water

Because of the potentially wide variability of human subjects, we have consistently employed the paired run technic This provides for a control group to be run in parallel with one or more additional groups receiving test diets containing specific experimental variables. Each test group has consisted of four to six men, and as many as 16 subjects have been observed at one time

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City Teaching Day May 18 1946.

The experimental diets utilized have been in the form of specially baked, uniform biscuits and have variously provided 400 to 1,800 calories daily The intake of water has been either ad libitum with volumes strictly recorded or inflexibly limited to 800 cc daily This 800 cc figure represents the average daily expectation of a life raft castaway from the combined use of his desalination kit, solar still, and rain water collected on a tarpaulin The dietary content of protein has ranged from 0 to about 50 Gm daily

Although a great number of clinical and laboratory aspects of deprivation have been studied, we shall here report only on those pertaining directly to protein metabolism These factors can be listed as follows (1) type and quantity of protein, (2) level of caloric intake, (3) quantity of fat, (4) supplementation with d-l methionine, (5) intake of salt, and (6) level of intake of water

Let us now examine the first of these factors, the question of the type and quantity of protein used Since Mitchell assigned an arbitrary maximal "biologic value" of 1 to the perfect protein, there has been a growing appreciation of the importance of quality as against simple quantity This has been evidenced by the stress laid on balanced amino acid patterns, particularly in the development of protein hydrolysates More recently, Mitchell's rather rigid principle has been challenged by the concept of "biologic efficiency" advanced by our colleagues Swanson and Allison According to the latter, a given protein may exhibit a greater utility than that represented by the standard "biologic value" and, on occasion, may even definitely exceed Mitchell's maximum of 1 for the "complete" protein Such variability, plus the capacity to exceed the theoretical maximum, is dependent upon the state of the recipient organism As the tissues become more depleted, they acquire a greater ability to retain protein

In our early experiments, we tested rations containing a number of different protein sources These included lactalbumin, malted milk protein, raw egg albumin, dehydrated egg albumin, and dehydrated whole egg Of all these, the dehydrated egg albumin proved the most efficient and uniform, hence it has been used almost exclusively in most of our studies to date This does not preclude the possibility that some of these other proteins could be better processed and prepared to provide greater efficiency

As a matter of fact, it is quite possible that those proteins found unsatisfactory for our specific needs might prove excellent for other purposes even without modification It is the growing conviction of workers in the field that the efficiency of any protein is essentially dependent upon the job it is expected to do Among the hydrolysates, for example, some have been found very good for regenerating plasma proteins, some for rebuilding red blood cells, others for maintenance of bodily weight, and still others for promoting growth A given protein preparation may produce optimal results in one direction and be relatively useless in many others Further research will eventually elucidate the specific potentialities of the various types of protein

As we indicated earlier, the level of caloric intake may influence the fate of ingested protein to a significant degree, primarily because of the tendency to burn protein for energy When we fed our subjects rations containing 3 Gm nitrogen derived from 20 Gm dehydrated egg albumin, no utilization of the nitrogen was noted when the caloric intake was 400, 900, or 1,200 It was not until the daily intake was raised to 1,500 and 1,800 calories that any significant retention of protein nitrogen occurred

Since the basal level of urinary nitrogen excretion in subjects on protein-free diets usually averaged about 6 Gm daily, we increased the level of dietary protein nitrogen to 6 Gm in an attempt to approach positive nitrogen balance That this result was attained at 1,800 calories was not too surprising That it also occurred at the 900 calorie level was indeed unexpected It appears that a simple increase in the amount of protein fed markedly improves the efficiency of its utilization It is not yet known to what extent such increases in protein intake may be made with continuing benefit, nor is the underlying mechanism clear

The incorporation of fat in a survival ration of any sort has certain obvious advantages Since there is usually a limit on both the weight and space allotted for the storage of survival rations in any military craft, a high caloric density is greatly to be desired In addition, the inclusion of some fat in the diet can contribute to the acceptability of a ration In most of our earlier studies we included hydrogenated fat to the extent of 10 per cent by weight This figure was more or less empiric and represented a quantity that would not be likely to produce digestive disturbances In order to check the maximum amount of fat that could be used without causing digestive upsets, we set up three groups of four men each All three groups were fed isocalorically at the 900 calorie level, with each diet supplying 6 Gm of protein nitrogen The fat level, however, varied The first group received 10 per cent by weight, the second 20 per cent, and the third 30 per cent, with proportionate reductions in the amounts of carbohydrate The results were twofold First of all, no gastrointestinal difficulties were encountered with any subjects Secondly, the group receiving the 30 per cent fat ration showed a distinct decrease in the excretion

of urinary nitrogen when compared with the groups ingesting 10 per cent and 20 per cent Since the three diets were isocaloric, the nitrogen sparing effect is apparently due to something intrinsic in the higher fat content as such This observation may ultimately be applicable to specific clinical situations, which my colleague Dr McGavack will discuss in Part II of this presentation

The next phase of experimentation was an attempt to corroborate the beneficial effects of methionine supplementation on nitrogen metabolism. Three sets of paired group studies were made, with caloric levels of 900, 1,200, and 1,800, respectively In the first study, no protein nitrogen was present in the diet, in the second, 3 Gm of protein nitrogen, and in the third, 6 Gm of protein nitrogen. The methionine supplement was 5 Gm. daily in the first experiment and 2.5 Gm. in the other two The results in the methionine-fed groups, in comparison to those not receiving methionine, can be summarized as follows increased urinary volume, increased urinary solutes, increased total urinary nitrogen increased urinary urea nitrogen, greater negative nitrogen balance, increased urinary ammonia nitrogen, increased urinary potassium, and decreased serum potassium.

It is apparent from this that methionine supplementation not only did not improve nitrogen utilization but was actually associated with some deterioration. This marked difference between animals and man may perhaps be due to differences in the conditions of experimentation, but it is highly suggestive of a species difference. In this latter aspect, it most certainly emphasizes the point that one cannot and should not try to transfer bodily data from studies with animals to man.

Another aspect of these studies concerns itself with salt supplementation Our first experimental diets provided no salt, and practically all the subjects developed clinical symptoms of salt deficiency by the second day of deprivation. The manifestations consisted principally of severe muscular cramps and aches and head aches. They were associated with decreases in serum sodium and chloride concentrations and increases in serum potassium levels. Subsequent supplementation of similar diets with as little as 1 Gm. of salt daily completely prevented these changes and also seemed to have a moderately beneficial effect on protein utilization Analysis of a large series of dietary regimens wherein we added salt revealed several interesting phenomena as regards serum electrolyte concentrations. The sodium and chloride levels remained consistently normal, but the potassium concentrations almost invariably were reduced as either the caloric or the protein content of the diet was increased All these findings are highly suggestive of some relationship to adrenal cortical function and, in fact, could be correlated with alterations in the urinary excretions of total 17-ketosteroids.

The last experimental data we shall discuss here relate to the effect of fluid intake upon nitrogen utilization. Preliminary comparisons of limited (800 cc.) and ad libitum intakes of water indicate that a free intake of larger quantities of water produces a distinct increase in the excretion nitrogen. This phenomenon is being studied further to check our initial impression that it is tied up with electrolytic and steroid alterations

These experimental studies we have presented today emphasize a number of general points in addition to the specific data offered. There is far too much stress laid on the simple caloric content of the diet and not enough on the important intrinsic components thereof This is true whether we are dealing with clinical problems or whether we consider the feeding of starving populations overseas Proper feeding is essential for both physical and psychologic well being

Not only can experimental results obtained with animals not be applied directly to human beings, but also work done with human subjects must be critically evaluated Aside from considering the wide range of normal human variability, strict attention must also be paid to the actual status of the subject, whether he is healthy or sick, whether an illness is acute or chronic, whether there is depletion or starvation, or whether there has been any adaptation to adverse environment It is only by properly controlling and correlating all these factors that truly accurate answers to the multitude of nutritional and metabolic problems that confront us will be obtained

The studies here reported are important not only for military use but have implications in clinical medicine. They have a bearing on postoperative care, wound healing, general resistance to infection, hepatic diseases, and problems of obesity and cachexia.

The experimental studies herein reported were carried out at the New York Medical College Metropolitan Hospital Research Unit Welfare Island, New York, under the sponsorship of the U S. Army Quartermaster Food and Container Institute.

II Clinical Applications

THOMAS H McGAVACK, M D , and DAVID SCHWIMMER, M D , New York City

NO GIVEN set of experiments in the field of protein metabolism has yet included all the conditions or exemplified all the circumstances which must be met to answer completely the physician's needs in relation to body utilization of protein material Therefore, conclusions drawn from any one group of investigations are not necessarily capable of universal application to every type of problem in the field This should perhaps need no emphasis here, but there exists such a large mass of undigested fact within the field of protein metabolism that it seems important to keep our heads clear and accept wholeheartedly only those facts which have been repeatedly verified and satisfactorily applied at the bedside Above all, it seems necessary to avoid swings to the extremes on the basis of a few experiments, as for instance, the wave of enthusiasm for methionine as a protein supplement or the routine employment of protein hydrolysates with little attention to the nature or phase of the condition for which prescribed There are so many factors involved in the role of proteins in nutrition, e g , minerals, vitamins, the influence of one amino acid or protein upon another, the fluid intake, the condition of the tissue stores of protein at the time of administration, etc , that each fact or statement made must be accepted only in the light of the conditions under which it was established I hope this statement will stand out clearly above all others in the few comments that are to follow

Disturbances in protein metabolism commonly observed in the practice of medicine fall rather logically into the three following main groups when classified according to the nature of the protein fault (*a*) protein intake less than normal, (*b*) a specific metabolic factor altering protein metabolism, and (*c*) nonspecific stress influencing protein metabolism

In connection with the first category (Table 1), we have subjected normal human volunteers to various dietary regimes, in which the caloric equivalents ranged from 450 to 1,800 calories, and the protein complement has varied from 0 0 to approximately 0 6 Gm per Kg of body weight Dr Schwimmer's comments have been concerned with the presentation of a small portion of the data derived from these experiments Our second group of experiences deal with glandular disturbances and are summarized in Table 2 These involve, mainly, balance studies for nitrogen, various electrolytes, water, etc , before, during, and after a variety of treatments with glandular or glandular substitution products In the third group of experiments which fall in the third category (Table 3), observations have been made regarding the variations in nitrogen metabolism, especially in relation to acute and chronic infections

TABLE 1 —CONDITIONS IN WHICH PROTEIN INTAKE IS LESS THAN NORMAL

Causes	
1	Unavailability of food
2	Dietary restriction due to disease or age e g , peptic ulcer cardiac decompensation nephritis etc.
3	Failure in absorption
	(*a*) Vomiting, intestinal obstruction diarrhea ulcerative colitis, etc
	(*b*) Sprue celiac disease etc
	(*c*) Hepatic disease
Treatment	
1	Restrict fluid until condition can be corrected
2	Restrict salt until condition can be corrected
3	High quality protein easily assimilable form
4.	Parenteral feeding

TABLE 2 —CONDITIONS IN WHICH SPECIFIC METABOLIC FAULT INVOLVES PROTEIN

Causes	
1	Hematopoietic disease
2	Glandular disturbances
	(*a*) Diabetes mellitus
	(*b*) Hyperthyroidism
	(*c*) Hypogonadism
	(*d*) Hypopituitarism
3	Gout
4	Nephroses
5	Hunger edema
Treatment	
1	Increase or decrease protein or protein fraction
2	Specific therapy e g iron, liver hormones

TABLE 3 —CONDITIONS IN WHICH NONSPECIFIC STATES OF STRESS ALTER BODY CAPACITY FOR PROTEIN UTILIZATION

Causes	
1	Acute—alarm reaction trauma burns operation
2	Chronic—adaptation resistance and exhaustion—repeated infections, chronic infections etc
Treatment	
1	Acute—alarm reaction—hepatic factor
	(*a*) High quality protein
	(*b*) Glucocorticoids and mineralocorticoids
2	Chronic
	(*a*) Increase protein intake
	(*b*) Corticoid and testoid hormones

Protein Intake Less Than Normal

Fortunately, the physician should rarely have to deal with conditions in which the intake of food is limited by its scarcity in this country Nevertheless, this subject is a matter of great import to the armed services of our country and one which has occupied a considerable portion of our investigations Several interesting observations may be emphasized For instance, when both the total calories and the protein are restricted, the restriction of water, within certain limits, appears to spare body protein For example, with diets

containing between 900 and 1,800 calories and not more than 0 6 Gm protein per Kg of body weight, there was less loss of nitrogen when water was restricted to 800 cc daily than when it was used ad libitum Likewise, the presence of too much salt in the diet of such persons may aggravate the edema of the tissues and still further cripple their function, whereas too little salt can give rise to symptoms of salt deficiency and interfere with the efficiency of the kidney in ridding the body of nitrogenous waste In our own experiments, 1 Gm of salt added to diets varying in caloric equivalent from 450 to 1,800 calories and in nitrogen content from 0 0 to approximately 40 0 Gm. has improved renal efficiency without apparently interfering with tissue activity

In diets of subcaloric value, a high quality protein can exert some sparing action on the bodily economy, as it lessens the loss of nitrogen and weight and decreases the load on the liver In the present experiments, egg white has proved to be the best of such proteins, although whole egg and whole milk proteins have also demonstrated high protective activity Specific amino acid supplements, such as methionine, have not improved the action of egg white. This, of course, may have been due to the fact that under the specific conditions of our experiments the egg white already afforded sufficient methionine Keeton and his associates have confirmed the fact that methionine as a dietary supplement has not exerted a "sparing" action on protein metabolism [1] They gave 2 Gm. daily to subjects taking a calorically basal maintenance diet with adequate protein, the source of which was not stated I think these facts illustrate a point that is germane to the whole subject of applying our knowledge of protein chemistry and physiology at the bedside Shortly after methionine was shown to have a sparing action on protein metabolism in small laboratory animals under certain conditions and when it became available in readily ingested form, there was a wave of enthusiasm for its indiscriminate use wherever protein deficiency existed Not only may such therapy be both useless and needlessly expensive, but conceivably it can do harm as, for instance, in our subjects where the total urinary nitrogen and its urea and ammonia constituents invariably increased when such supplements were used

Furthermore, the amounts of an essential amino acid may vary with the nature and total amount of protein taken and the mode of its administration. This has been demonstrated at least for phenylalanine.[2] Therefore unless we have very specific indications for a particular amino acid it seems wisest in the present state of our knowledge to administer high quality protein containing all the essential amino acids rather than attempt to use expensive supplements of doubtful value

Dietary restrictions brought about by disease and failure to retain or absorb ingested food may lead to protein deficiencies (Table 1) and may be dealt with as just described Should it be necessary to give such food parenterally, then whole blood or blood plasma affords the highest quality of protein obtainable Protein hydrolysates are much less expensive and will usually make up the deficiency except in patients with severe hepatic disease but even where the liver is functioning normally, a certain percentage of the amino acid may be lost through the kidney [3]

Specific Fault in Protein Metabolism

Intrinsic disease of some organ or system may give rise to disturbances in metabolism that alter the requirements for protein both qualitatively and quantitatively (Table 2) In connection with other studies, it has been our privilege to study nitrogen and other balances under standard conditions of diet and activity in glandular disturbances which alter the behavior of protein within the body In general, these conditions must be approached by decreasing or increasing the protein intake, depending upon the nature of the derangement, and by the application of hormones or drugs specifically directed to the correction of the altered function For instance, the use of a low purine diet in gout needs no emphasis The application of insulin stops the excessive wastage of diabetes mellitus Positive nitrogen balance may be attained in hyperthyroidism by forced feeding, by the administration of corticoids, or by the use of "antithyroid" compounds

Nonspecific States of Stress Altering Body Capacity for Protein Utilization

A wide variety of acute and chronic stresses may interfere with or otherwise alter the ability of the tissues of the body to utilize protein (Table 3) It is with this group of conditions that the physician of today is most frequently faced The body reacts differently and to some extent oppositely to acute and chronic stresses respectively, more or less in accordance with Selye's concepts as expressed in the adaptation syndrome.[4] Under acute stress, that is in the alarm reaction of Selye, as seen, for instance, following trauma, burns, or operative procedure, a striking negative balance for nitrogen is established While this negative balance may be mitigated or even changed to a positive one, the catabolic process cannot be prevented, even by the use of "anabolistic hormones such as testosterone,[4-6] In cases of elective surgery, this catabolic period can be minimized by the proper diet preoperatively and by the use of large amounts of protein

during and for varying periods of time after the surgical procedure Keeton and his associates have shown that a high protein intake is the most important part of such a remedial regime [1] They achieved positive nitrogen balance during this catabolic phase by the use of a basal maintenance diet, high in protein (2 7 Gm per Kg body weight). The increase in the protein over and above that normally required is important, as we have been unable to effect positive balance by a basal maintenance diet plus 50 per cent with 1 4 Gm of protein per Kg body weight, whereas Keeton and his associates found this possible with a basal maintenance diet plus 20 per cent in which 40 per cent of the calories were derived from protein (2 7 Gm per Kg body weight) [9 1]

Immediately following conditions of acute stress, protein hydrolysates are of very slight value in relieving the negative nitrogen balance, although they may be of considerable use in building up the body store of protein when used prior to the event, e g , operation In cases of unexpected emergency, blood plasma or whole blood is preferable and at the same time is the best available source of protein, although it must be emphasized that it cannot completely prevent the catabolic phase which accompanies the alarm reaction of Selye This catabolic phase is probably secondary to intensive stimulation of the adrenal cortex with an outpouring of corticoids, particularly those concerned in gluconeogenesis

Conditions are quite different in subjects with chronic illness associated with debilitation Here the output of urinary corticoids may be low or within the lower range of normal If sufficient protein and calories can be administered, a positive nitrogen balance and eventual gain of weight can always be established in these conditions Such utilization of protein may be materially aided by the use of testosterone therapy which often stimulates the appetite and always results in a retention of nitrogen and its synthesis into new tissue

Conclusions

Our newer knowledge of protein utilization enables us to

1 Prepare more adequately for surgery than ever before

2 Decrease fatality due to rapid depletion of the body's stores of protein in conditions of acute stress such as extensive burns

3 Improve the status of patients suffering from chronic debilitating illnesses, particularly those of an infectious nature

These objectives can be accomplished by bringing the intake of protein into adequate relation with its loss and by the administration of certain hormones which regulate nitrogen metabolism, particularly those concerned with the anabolistic phases of protein activity, such as testosterone

HEMIPLEGIA PATIENTS RESPOND TO PHYSICAL MEDICINE TREATMENT

An intensive program of rehabilitation which enabled patients with partial paralysis to walk again is reported by Comdr Edward W Lowman (MC), USN, Department of Physical Medicine of the U S Naval Hospital in Philadelphia in the *Journal of the American Medical Association* (May 29)

Use of physical medicine, which proved so effective in these patients, includes massage in the first stages of treatment, application of heat and therapeutic baths, followed by active exercises in bed when the patient is able to move

The patient is encouraged to try to walk within two to eight weeks after treatment is started This is a gradual process, beginning with sitting up in bed and placing the feet on the floor from the bedside, and concluding with gymnasium exercises.

Twelve out of 18 patients with hemiplegia, paralysis of one side of the body following brain hemorrhage, responded to this reconditioning program within one hundred eighteen days Treatment was begun two to four weeks after the onset of their illness Three others of the group showed definite improvement while three did not respond to the treatment.

Nine out of ten additional patients learned to walk again after sixty-seven days of treatment, with improvement being noted in the other patient

Commander Lowman attributed the greatest factor in the success of the rehabilitation treatment to "cooperation on the part of the patient, fostered by his desire to regain his independence"—*Science News Letter, June 5, 1948*

THE ROLE AND CONTROL OF RENAL DYSFUNCTION IN CONGESTIVE HEART FAILURE

LOUIS LEITER, M D , New York City

(*From the Medical Division, Montefiore Hospital*)

THE kidney is uniquely related to the heart both in health and in disease of the circulation. Disturbance of this relationship in congestive heart failure leads to serious consequences *for the entire organism.* It is, *therefore, important* to determine the nature of the renal dysfunction in heart failure in the hope of developing and applying rational therapeutics A brief considera tion of the normal cardiorenal relationship will help in the understanding of the pathologic situa tion

Normally, under basal conditions, about one fifth of the cardiac output goes to supply the kid neys. This is the renal fraction of the cardiac output—almost as high as the liver fraction or the cerebral fraction From the renal plasma flow about one fifth again is pressed out during glomerular filtration to furnish the raw material for urine formation. The process of filtration also requires an adequate blood pressure, provided by the energy of the heart, to overcome the periph eral resistance of the glomerular arterioles, afferent and efferent, the osmotic pressure of the plasma proteins, and the intrarenal tissue pressure. Tubular reabsorption is mainly a process of conservation of body fluids and their contained *electrolytes* and other *essential substances,* such as glucose, amino acids, and vitamins Under normal conditions, 98 to 99 5 per cent of the glomerular filtrate is reabsorbed To prevent wide fluctuations in filtration due to changes in renal blood flow with physiologic variations in cardiac output, the kidney has an autonomous regulation of glomerular filtration pressure by the unequal constriction or dilatation of afferent or efferent arterioles [1] In the case of the afferent or proxi mal glomerular arteriole, dilatation increases both blood flow and filtration pressure while constriction reduces both flow and filtration. On the other hand, dilatation of the efferent or distal glomerular arteriole increases renal blood flow but decreases filtration pressure while constriction of this arteriole reduces blood flow and in creases filtration pressure

This mechanism of efferent constriction becomes very important in maintaining filtration pressure whenever renal blood flow is reduced in health or disease In health, renal blood flow is regularly reduced whenever more blood is required elsewhere in the body, for example, in postural changes of the circulation, in ambulation or exercise, in thermal vasodilatation of the skin *Renal blood flow is markedly reduced in all forms* of shock, whether medical, traumatic hemor rhagic, or surgical [2] Up to a point this is useful to the organism as a whole, since it diverts blood to more vital areas at a time when the cardiac out put is low However, renal function suffers, and filtration would be almost abolished, were it not for efferent constriction. It is also characteristic of established hypertensive vascular disease that glomerular filtration may be normal or only little reduced in spite of moderate or considerable decrease in renal blood flow This again means increased efferent arteriolar constriction with a high filtration fraction.[1]

Yet the most striking example of chronic efferent constriction is seen not in hypertension but in chronic congestive heart failure.[3] Here, the renal blood flow is often reduced to one third or one fifth of normal, while the glomerular filtration is reduced only to two thirds or one half Even this decrease in filtration is important in cardiac edema but things would be much worse were it not for the compensatory efferent constriction How the kidney sets off this mechanism is unknown, nor is it established just what the effector agent is, e g , renin, vasoexcitor material of Zweifach, Shorr *et al.*, or some other vasoactive substance acting singly on the efferent arteriole but, more likely, jointly with circulating epinephrine, sympathin, or other biologic com pounds [4] There is good evidence from the experiments of Mokotoff and Ross with spinal anesthesia that there is no neurogenic component in the renal vasoconstriction and the high filtration fraction in chronic congestive failure.[5] No data is available on patients in acute cardiac failure

The question now arises as to the relationship between cardiac failure and the observed renal dysfunction. Is the reduced renal blood flow merely another consequence of general passive congestion and back pressure in the renal veins? There are several reasons why this cannot be the answer First, the changes in renal blood flow and glomerular filtration are, as Merrill and Mokotoff have shown independent of the level of venous pressure.[5 6] They persist even when the venous pressure is normal as the result of digital

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City General Sessions May 19 1948.

ization, mercurial diuresis, and other cardiac management Secondly, experimental renal venous congestion in normal man, produced by abdominal compression as in the careful experiments of the Bradleys, causes a much smaller disturbance in renal function than occurs in congestive failure [6] We must, therefore, conclude that the reduced renal blood flow and low glomerular filtration in congestive failure are primarily the result of poor cardiac output, a manifestation of forward failure Later, when venous hypertension develops and persists, it adds a further handicap to renal blood flow and function

The new concept, introduced by Warren and Stead in 1944, concerning the role of the kidney in the edema of cardiac failure, has helped to clear up the mystery of the nature of the salt or sodium retention, already well established, nearly fifty years ago by Achard, Widal, Strauss and their associates [7] It has also strengthened the evidence of Starr that venous hypertension involves much more than right heart failure, that it really results from venous engorgement or increased blood volume, and that it has a compensatory function in maintaining cardiac output [8] The increased plasma volume necessary to distend the veins and raise the pressure in them, we now know, is the result of renal retention of salt and water In this sense, forward failure, by causing the renal dysfunction in heart failure, is indirectly responsible for venous congestion or backward failure The keystone of the arch of heart failure is renal retention of sodium chloride It took a long time to recognize this idea because ordinary tests for renal function, including the urea clearance, were not sufficiently informative or accurate to demonstrate the basic renal dysfunction, first indicated by Seymour *et al* in 1942, the same year in which Schroeder and Futcher clearly dissociated salt and water excreting abilities in congestive heart failure and pointed to the kidneys as the site of the trouble [9 10] The emphasis on the kidneys, however, should not be misinterpreted to imply that Starling's concept of fluid exchange in cardiac edema is no longer valid or that venous and capillary pressures cannot be rapidly elevated by acute cardiac failure or by exercise in the chronic cardiac Under these circumstances pulmonary or peripheral edema readily develops The important fact is that even at bed rest, even when venous pressure is in the normal range, even when the body is free from visible edema or excess fluids, the patient in chronic cardiac failure has a reduced renal blood and glomerular filtration rate which, in themselves, predispose to continued retention of salt and ultimate development of gross edema and venous congestion

This circulatory involvement of the kidney in congestive failure has some very important effects A reduction of 33 per cent in glomerular filtration rate means that 33 per cent less salt is filtered When you remember that normally only 1 per cent of the filtered salt is excreted, that 99 per cent is reabsorbed or conserved for the body, you can appreciate what a tremendous attraction for filtered salt normal tubules possess Even the powerful diuretic, mercury, rarely reduces tubular salt reabsorption below 96 per cent Therefore, when filtration is cut 33 per cent, the tubules receive much less saline than they are accustomed to handling normally, and they find it all too easy to reabsorb practically all the salt, leaving next to nothing for excretion in the urine Since about 80 per cent of this reabsorption occurs in the proximal tubule and only 15 or 20 per cent in the distal tubule, and since ingestion of extra water has no effect on filtration but produces diuresis by inhibition of pituitary antidiuretic activity on the distal tubule, it becomes clear why water diuresis in heart failure carries out very little extra salt The salt has already been largely absorbed higher up than the site of water diuresis

The failure of renal salt excretion in congestive heart failure is, therefore, related intimately to normal tubular reaction to reduced glomerular filtration This is the same response in a more chronic form as the subacute response of renal tubules to subacute loss of salt from the body on the Kempner diet, or as the acute response of the tubules to the acute loss of salt in severe sweating, vomiting, or diarrhea, in short, in all conditions associated with reduction of extracellular fluid and plasma volume, often with low serum sodium and chloride levels, and regularly with a 30 to 40 per cent or even greater reduction in glomerular filtration rate, the last just as in chronic heart failure [11] In all these conditions, except heart failure, the tubule behaves as it should, it reabsorbs practically all the diminished salt filtered, thereby benefiting the organism by preventing further loss of badly needed extracellular electrolytes Unfortunately, in heart failure, there develops not a shortage but a plethora of extracellular fluids as a result of this behavior of the kidney The tubules do not know that the reduced filtration is not really part of a circulatory shock due to low plasma volume They do not know that the plasma volume is increased, because, ordinarily, increased plasma volume is associated with increased cardiac output and increased glomerular filtration They react merely to the low volume of glomerular filtrate and as long as renal blood flow and filtration remain low, salt will be retained by the kidney even though the body bursts its seams with edema

There is no evidence as yet to substantiate the belief of some investigators that excessive activity

of salt- and water-retaining hormones is to blame for the behavior of the renal tubules in heart failure. If this should turn out to be the case, it will probably not be a finding peculiar to congestive failure but the identical mechanism set in motion in all other forms of acute and subacute salt dehydration and reduced renal circulation A reduced or inadequate cardiac output, an expression of forward circulatory failure, will probably also be found in all these situations

You may ask now "Why is it that in other conditions associated with low glomerular filtration rates, such as Simmond's disease or panhypopituitarism, Addison's disease, hypertensive renal vascular disease of long duration, and various cachectic states, one does not find edema as in heart failure?" The answer is twofold

(1) The tubules can be shown to be structurally damaged or functionally disturbed in these conditions so that they can no longer reabsorb salt as well as normal tubules Therefore there is no edema and, in fact, even dangerous loss of salt as in Addison's disease.

(2) Many of the conditions listed are associated with anorexia and weight loss due to poor intake of food Thus frequently entails a sharply reduced intake of salt Even a cardiac patient who has normal tubules may be kept edema free on a low salt diet Adding extra salt to the diet would soon bring out the true state of affairs You are all familiar with the ease with which edema is produced by parenteral saline in cachectic people, even when their plasma proteins are not too low Similarly, edema can be readily produced by a high caloric, normal salt-containing diet given to a concentration camp victim especially if he is allowed to be up and around, whereby his glomerular filtration rate is kept low much of the day [12] These so-called exceptions to the rule that low glomerular filtration predisposes to salt retention really help to strengthen the case for the theory

Please remember that there are numerous factors in cardiac edema as in renal edema and that the ultimate result stems from a dynamic algebraic equation in which plus and minus factors can cancel each other out Thus removal of salt from the diet, if rigid enough, may cancel out a low plasma albumin. Bed rest may cancel out increased venous pressure in the legs Motion of the arms with improvement of lymphatic drainage may cancel out both low plasma albumin and increased venous pressure in production of edema and digitalis and aminophyllin may cancel out renal retention of salt by increasing cardiac output and glomerular filtration [13] At any one moment many items must be taken into account in figuring the reason for the presence or absence of edema. We must beware of oversimplification but for clear thinking we must tackle one factor at a time The renal factor in heart failure is itself a complex of problems, but, fortunately, it lends itself to quantitative analysis

What does this analysis of the role of renal dysfunction in congestive failure teach us concerning the therapeutic control of the disturbance? First it teaches us that we must make every scientific effort to break the vicious cardiorenal cycle by improving the cardiac efficiency so as to increase the cardiac output and restore a more normal renal blood supply This means rest digitalis, oxygen, purine diuretics, and other accepted measures for treating a weakened myocardium and at the same time increasing glomerular filtration.

Second, the dictates of common sense teach us that when the excretion of salt is seriously impaired, the least we can do is to educate our patients to get along without it, especially when much good and no harm can result from dietary restriction of sodium in most patients This is particularly necessary because chronic cardiac insufficiency may go on for decades, because next to malnutrition and parasitic infestation, cardiac failure is the most important health problem in the world, because all other management of cardiac edema, including the regular and frequent use of mercurial diuretics is finally unsatisfactory unless a low salt diet is followed The enthusiasm which has greeted the revival of this classic therapeutic method in the last five years is an eloquent tribute to its effectiveness as well as a sad commentary on the neglect of a rational therapy for several decades The physicians who are interested in the best treatment of chronic heart failure will have to exert pressure in their respective communities including the hospitals, for the provision of salt-free bread, unsalted butter or unsalted oleomargarine, unsalted canned vegetables and salt-free milk preparations Only after this has been accomplished is it worthwhile investigating the merits of salt substitutes Remember diabetes—the prescription of saccharin is not the major emphasis in the training of diabetic patients although it is the easiest and sweetest part of the ritual

Third, restriction of fluids is unnecessary illogical, and often harmful in cardiac failure.[14 15] It has nothing to do with restriction of salt, a low fluid intake cannot counteract an excessive salt intake In fact, if the diet is low enough in salt extra fluids may increase sodium excretion somewhat because the kidney cannot reabsorb salt perfectly [16] But forcing of fluids to the point where the patient must drink all day in order to urinate all night is not exactly helpful to a tired heart a congested gastrointestinal tract, or a barbiturated psyche.

Fourth, in all but the very mild cases of chronic heart failure, the osmotic diuretics, such as urea or potassium salts, are not sufficiently effective nor sufficiently tolerated by the gastrointestinal tract to warrant their extended use Similarly, the oral administration of purine preparations, some of which actually contain sodium, is often of doubtful value because of a deleterious effect on the appetite It is, therefore, necessary to rely heavily on the organic mercurial diuretics since they act directly by decreasing tubular reabsorption which allows a larger fraction of the reduced glomerular filtrate and its salt content to escape into the urine The degree of response will vary with the amount of edema present, the state of the circulation in general and in the kidney in particular, the dosage of mercury, the auxiliary effect of acid-forming drugs, like ammonium chloride or nitrate, and the functional state of the renal tubules On low-salt regimes the diuretic response to mercury will naturally be less after the major part of the edema has been swept out than on more liberal diets This does not mean that the patient is better off on a higher salt intake It simply means that it takes much longer to accumulate a certain amount of fluid on 1 5 Gm of salt a day than on 3 or 4 Gm Therefore, less frequent use of mercurials is indicated on a good salt-poor diet Violent fluctuations in weight, edema, diuresis, and dehydration are thereby avoided

There are, however, instances of severe congestive heart failure in which, in spite of all appropriate therapeutic measures, diuresis and mobilization of edema are very difficult to achieve These patients are resistant to mercury and are exposed to the danger of increase of dosage to the point where mercury intoxication may occur Apparently, in these cases, one reason for failure to respond to ordinary amounts of mercury is an extremely low glomerular filtration of salt Under these circumstances even the partial inhibition by mercury of proximal tubular reabsorption does not suffice to provide more sodium than the distal tubule can normally reabsorb [16] Therefore, very little extra salt appears in the urine Here, again, the only real remedy lies in improving the general circulation and the renal blood supply and glomerular filtration rate This, unfortunately, is often impossible in the advanced stages of congestive failure

The fifth and final therapeutic lesson derived from our analysis of the role of renal dysfunction in congestive failure teaches us that there is a method of relieving the patient of extensive edema even when his kidneys no longer respond to mercurials We take advantage of the necessity of removing ascitic fluid by carrying out peritoneal dialysis with the instillation of several liters of 5 per cent glucose solution [17] After equilibration for two or three hours, this fluid contains almost as much salt, per liter, as the plasma, and its removal acts like a good mercurial diuresis except that the salt and the water of the edema fluid leave the body separately instead of together This is of very little consequence even though the interval is about twenty-four to forty-eight hours The patients to be treated in this manner must be carefully selected to avoid unpleasant consequences from respiratory or circulatory embarrassment, but the results may be very gratifying

To summarize this discussion, the normal circulatory relationship between the heart and the kidneys has been analyzed and used as a basis for comparison with the disturbed situation in congestive heart failure Cardiac renal dysfunction has been shown to affect glomerulotubular balance in such a way as to favor retention of salt by the normally reabsorbing renal tubule when presented with a less than normal amount of glomerular filtrate This renal retention of salt is a key factor in producing some of the important signs and symptoms of congestive heart failure Our increased knowledge of the mechanism of cardiac renal dysfunction has served to rationalize our therapeutic efforts Among these, most important are restoration of myocardial efficiency, restriction of salt in the diet, permission of normal intake of fluids, judicious use of mercurial diuretics, and, in the nonresponsive advanced stage of congestive failure, resort to extrarenal or peritoneal removal of salt

FETAL DEFECTS RESULTING FROM ILLNESSES OF THE PREGNANT MOTHER WITH SPECIAL REFERENCE TO VIRUS DISEASES

MURRAY H BASS, M.D , New York City

(From the Pediatric Department, Mount Sinai Hospital)

IN 1941 there appeared in the *Transactions of the Ophthalmological Society of Australia* an article by an oculist, N Gregg entitled "Congenital Cataract Following German Measles in the Mother "[1] The observations recorded in Gregg's paper were so astonishing that they quickly found their way into medical literature all over the world Swan and his collaborators, also in Australia, corroborated the previous findings and reported a number of new cases.[2-4] What amazed physicians everywhere was that rubella, heretofore considered so innocuous and medically so uninteresting, should suddenly become a disease of very great importance From the data obtained in Australia and later confirmed here in the United States, it became clear that in the case of rubella, when the mother became infected during the early months of pregnancy, congenital defects of the fetus were the rule In April, 1946 I reported a summary of our knowledge of this subject before the American Academy of Pediatrics in New York City and was able to collect about 200 cases from the literature, to which I added six new cases Many more cases have been reported since that time.

The findings in the case of rubella are of great importance, not only because they furnish us with a definite causative factor for certain congenital anomalies, but also because they prove so well that congenital defects may be the result of maternal disease acquired after conception has taken place The findings have also led to greater interest in the relationship of disease in pregnant woman to fetal defects, and recent medical literature contains much on this subject

The most fundamental of the recent studies of congenital defects are those of Warkany[5-7] In his work on rats he was able to show that defects may be induced at will by exposing the mothers to certain deleterious influences during pregnancy Even changes in the mother's diet may be responsible for abnormal offspring For example, if the mother rat was kept on a diet deficient in vitamin A, a constant ocular defect, consisting of a fibrous retrolenticular membrane in place of the vitreous, was found in the offspring When the mother's diet was again supplemented with vitamin A, pregnancy resulted in normal offspring Similar experiments were carried on with the use of diets deficient in other vitamins which resulted in the appearance of other types of defects.

It is of interest that similar defects may be obtained in the offspring by harming the pregnant mother in an entirely different manner, as, for example, by exposure to x rays[6] Warkany points out and emphasizes that, etiologically congenital defects fall into two main groups those which are genetically determined, namely those where the fault lies in the genes themselves and, second, those resulting from adverse conditions affecting the developing ovum These latter may be dietetic, infectious, or actinic in origin. Of considerable importance is the fact that the same defect may arise as the result of either abnormal genes or injury to the developing fetus. Warkany gives the occurrence of cleft palate in a certain breed of mice, a condition which recurs owing to a genetic defect, as an example. However, in normal mice this same anomaly, cleft palate, may be produced by radiation of the pregnant mother or in other mice by a diet deficient in riboflavin Another example is human microcephaly, which in one instance is due to a genetic defect with several affected members in the family, in another instance follows infection of the mother with toxoplasmosis and in a third results from irradiation of the mother during the second and third months of pregnancy

We shall presently see that not only different abnormal conditions may give rise to the same congenital abnormality but that certain noxious influences constantly give rise to a particular group of defects. Such for example are the anomalies following maternal rubella Other virus infections of the mother may also lead to abnormal offspring It is of interest, therefore, before taking up the subject of rubella to review the general subject of virus transmission from the mother to the fetus.

The role of the placenta as a barrier between the mother and the fetus has long been a subject of much discussion. It is now fairly well established that the intact placenta does not permit the passage of micro-organisms from the maternal to the fetal circulation but that this only can occur when there is present some pathologic condition of the placenta itself Particles infinitely smaller

---

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City General Sessions, May 19 1948.

than bacteria, however, are certainly able to cross the barrier even when the placenta is healthy Take, for example, immune bodies These substances, antitoxins, precipitins, bacteriolysins, and complement fixing antibodies have been shown to occur quite regularly in the fetus Diphtheria antitoxin appears in the newborn infant in the same titer as it is present in the mother's blood, a fact demonstrated by Ratner and others [9]

The cord blood contains antibodies for scarlet fever toxin, as Toomey's results proved when he demonstrated the fact that serum from cord blood would in many cases blanche a scarlet fever rash when used intradermally in the Schultz-Carlton test and that it would also at times neutralize Dick toxin [10] This ability of the fetus to receive immunity from the mother has been used clinically by investigators to protect the newborn infant against disease Cohen and Scadron injected mothers with pertussis vaccine and were able to show immunity to whooping cough in the infants [11] Tetanus antitoxin has also been shown to appear in the infants, blood when the mother has been immunized This was proved especially useful in Africa where tetanus neonatorum was a common disease It is of interest to note that it has been shown by Bryce and Burnet that the placenta becomes less permeable for maternal antibodies during the later months of pregnancy [12]

That bacteria cross the placenta is borne out by the occurrence of congenital syphilis There are cases in the literature where the mother is suffering from gonorrhea, and the newborn infant has gonorrheal arthritis Pneumonia of the newborn is a not uncommon finding

Since our knowledge of erythroblastosis has advanced so fast during the past decade, we have come to realize that it must be not too rare for a product of the red cell to pass from the fetal to the maternal circulation, for it is by this means that the mother gradually becomes sensitized to her infant's blood type Another link in the chain of evidence is the occasional occurrence of protozoan diseases in both mother and infant

Some years ago I reported a case of congenital malaria in an infant, born in New York City in midwinter, who developed severe anemia found to be due to an overwhelming infection with tertian malaria [13] The mother had had untreated chills and fever during pregnancy and plasmodia were also found in her blood Cases are on record where plasmodia have been found in the cord blood

We know then that, occasionally, large particles like bacteria or plasmodia cross from mother to fetus and that much smaller bodies like antibodies also traverse the barrier It is not surprising then that viruses which probably lie midway in size between these two are also able to pass from the mother's circulation to that of her offspring Measles is a case in point A mother ill with the disease may give birth to an infant with the illness, or the disease may appear in the newborn child within a week of birth, showing by the brevity of the incubation period that the infection must have been intrauterine I saw such a case where the mother had just recovered from measles and the infant developed the rash on the seventh day of life

There are a few cases of varicella reported occurring under the same circumstances [14 15] One reported in 1939 appeared in the infant on the second day of life Smallpox and vaccinia are also transmissible to the fetus as is influenza In the last named, lesions typical of the disease have been found in the dead fetus Rabies has been inoculated into dogs from the brain of a fetus whose mother had died of the disease The animals developed rabies

Viral diseases affecting the nervous system are of special interest as regards their transmissibility Many of the encephalitides, such as lymphocytic choriomeningitis, pass from mother to fetus with ease In animal experiments the young have been shown to have acquired the disease while in the uterus, their brains have shown typical lesions, and the virus has been recovered from them In this particular connection the question of the infectivity of poliomyelitis is of considerable interest Since encephalitis is so easily transmitted, one would suppose that the virus of infantile paralysis would follow the same course Such, however, is not the case There have been no cases reported where women stricken with anterior poliomyelitis during pregnancy have transmitted the disease to their offspring Aycock and Ingalls do not agree with this and report fetal disease resulting from poliomyelitis [16] They mention three cases of maternal poliomyelitis contracted during the ninth month of pregnancy in which the infants were said to have the disease, but no details are given Harmon and Hoyne have reviewed this subject and say that "pregnancy has little, if any, influence on the course of poliomyelitis in a paralyzed mother, and, conversely, that in utero infection of the fetus occurs with rarity, if at all" [17] They quote the work of Brahdy and Lenarsky and of Kleinberg and Horowitz, all of whom agree that there is almost no chance of fetal damage due to poliomyelitis A few cases have died as the result of prematurity In one of Hoyne's cases the mother had bulbar symptoms, and the fetus died as the result of asphyxia The spinal cord was obtained, but no virus could be demonstrated in it by means of inoculation into monkeys The reason for this failure of the fetus to become infected is most

probably explained by the fact that the virus of poliomyelitis is not found in the cerebrospinal fluid nor in the blood stream and that, therefore, it has no way of getting into the placental circulation.

From the results obtained in the laboratory one should expect to find virus infections of the fetus to be very common occurrences because there are many findings which point to the fact that young, undifferentiated tissue is particularly susceptible to virus disease. For example, it has been shown that the viruses of vesicular stomatitis and equine encephalomyelitis can be cultivated in a medium of chick embryo in Tyrode solution [18] However, the hatched chick, when only two days old, is resistant to these same viruses The influence of increasing age of the host on the infectibility of its tissues is also brought out by Sabin's experiments on mice [19] If an infant mouse is injected with certain viruses by the intramuscular route, encephalitis results. However, if the same virus is injected into adult animals, the virus fails to reach the nervous system This has been found to be due to the formation of barriers which develop in the nerve pathways by which the virus travels. If the virus is injected into the nerve of a young animal, it passes unopposed to the central nervous system and causes encephalitis. If injected into an adult, it is blocked by a barrier in the nerve However, if the virus is injected intracerebrally, it causes encephalitis in the adult as well as the young animal In the same way, the young mouse develops encephalitis after intraperitoneal injection of virus, whereas the adult mouse fails to do so Again, if virus is injected into the muscles of a young animal, it multiplies rapidly, in the adult it does not To quote Ohtsky, "young actively multiplying tissue is generally more responsive to many viruses and also to tumors. Also chick embryos are readily infected by many viruses in contrast to chicks after hatching which become insusceptible to the same inoculants One can conclude, therefore, that, with age, non-nervous tissue—the 'peripheral organism'—becomes increasingly resistant to virus."[20]

From results such as these, is it not remarkable that although virus infections are so common in adults and although as we have seen, they are able to traverse the placental barrier, we do not see more virus disease in the fetus?

So far in discussing the transmission of viral disease to the offspring, we have not mentioned permanent damage that may result therefrom. It is now commonly believed that many cases of congenital spastic disease and congenital cerebral defects so frequently encountered may well be the result of intrauterine fetal encephalitis.

Quite recently a piece of research has been published which is extremely pertinent to the subject and deserves a detailed description. I refer to the paper of Hamburger and Habel.[21] Struck by the fact that rubella virus causes "a specific pattern of localized malformations," they set out to study the effect of virus on the embryo by directly injecting it into the developing hen's egg They worked with influenza A and with mumps virus, and their results are most interesting If they injected the influenza virus very early in embryonic life, they always got the same group of malformations namely, microcephaly and micrencephaly, malformation of the amnion, and twisting of the embryo's axis Moreover they discovered that the virus was much more concentrated at the cephalic end of the embryo than elsewhere, regardless of the place where the virus was injected When the mumps virus was used, the results were different It failed to produce a definite group of malformations However, it raised the incidence of deformities occasionally occurring in chick embryos These are Hamburger's and Habel's conclusions

> Experimental evidence has been presented to show that influenza A virus (PR8) has teratogenetic effects on the early chick embryo It produces a specific syndrome, comprising microcephaly and micrencephaly twist of the axis, and impairment of growth of amnion. Furthermore the virus is lethal for early embryos within three days after infection. The mumps virus is also lethal for early embryos within five days after infection It does not produce specific abnormalities but seems to raise the incidence of malformations of the types which occur occasionally in uninfected chick embryos These results place influenza A virus in line with rubella virus as a teratogenetic agent. Furthermore our observations on influenza A infections in chick embryos confirm the observations on rubella in humans in that only infections of early embryos result in abnormalities. Chick embryos of four days incubation are killed by the influenza virus, but it seems that at this stage of development most organs have passed the critical period at which their morphogenesis can be directed into atypical channels. In this respect, it is of interest to find that the patterns of infectiousness are different for the embryo and for the fully developed structures In the embryo the brain tissues seem to be particularly susceptible to influenza A virus, whereas in the adult the respiratory mucous membranes are primarily affected In mumps the inflammation of the salivary glands is frequently combined with meningitis, but no effect on the brain was found macroscopically in embryos. The situation is the same as in rubella where the embryonic defects seem to have no obvious relations to the manifestations of rubella infections in older phases of life.[21]

At the present time we have in the case of rubella a classic unquestioned example of the

deleterious effect on the fetus of a viral disease in the mother The observations of Gregg and of Swan and their collaborators in Australia have been corroborated many times, especially by case reports here in the United States [22–34] We know that if rubella attacks the pregnant mother within the first trimester of pregnancy, the offspring may be permanently damaged and may show defects including cataract, deaf mutism, cardiac malformations, mental retardation, microcephaly, and hypospadias The infants are often underweight at birth and are difficult feeding problems

My own personal experience with this syndrome consists of seven cases In six of the seven cases the mother's infection occurred in the first trimester, in one case it occurred in the fourth month and the infant showed mental retardation, congenital cardiac disease, and bilateral cataracts All but one of the six cases were mentally retarded, all but one had defective eyes, four having congenital cataracts and two glaucoma, five of the mothers contracted rubella in and about New York City, one in London, England, and one in Biloxi, Mississippi

It is hard to believe that so striking a syndrome should have escaped the attention of clinicians all these years, and it seems more likely that there occurred in 1940 some change in the virus of rubella Gregg was able to report 78 cases of congenital cataract encountered in a short period of time in the vicinity of the city of Sydney Moreover, the type of cataract appeared to be different from those previously encountered By circularizing the pediatricians, ophthalmologists, and obstetricians of California in the fall of 1944, Prendergast was able to collect so large a series of these cases that he believes they are more prevalent on the west coast and that the disease may have been brought over from Australia and spread from California eastward through the United States [35] However, it has since been established that an epidemic of rubella in England in 1940 was productive of many cases of congenital defects

Many defective children are reported, but as yet we have not enough data to draw any conclusions as to the frequency of rubella in pregnancy followed by normal infants This can only be determined by careful statistics gathered from many parts of the country At the present time a nation-wide investigation is being conducted by the American Academy of Pediatrics whose committee has sent questionnaries to all of its members In March, 1948, the committee released the figures for 132 of the cases reported to them where the mother had rubella in the first trimester of pregnancy Seventy-six babies had congenital cataracts, 13 had other ocular defects including glaucoma and microphthalmia, 35 were partially or completely deaf, 68 had abnormalities of the brain, 67 had malformations of the heart, and 18 babies were found to be free of all defects Studies are also being carried on in large obstetric services where prospective mothers are now routinely questioned as to the occurrence of illness during pregnancy which might possibly be of viral origin

Another method of obtaining information is to go back in the histories of children in institutions caring for those afflicted with defects which we now associate with maternal rubella An interesting example of this method is the work of Clayton-Jones, who investigated the histories of children in schools for the deaf in England [36] In one school, the results, according to the author, were "startlingly positive" Of the 18 children in the school, a history of maternal rubella was obtained in eight A ninth was probable, and a tenth was possible In all the positive cases the disease occurred in the first four months of pregnancy All the cases were born between August 24 and October 26, 1940, while the birth dates of the other children were scattered between 1929 and 1941 In three other schools for the deaf, 8 9 per cent of the inmates were born of mothers who had rubella during pregnancy Clayton-Jones points out that the 1940 epidemic of rubella in England gave rise to many cases of deafness, and he suggests that this may be due to the fact that the disease seemed particularly prone to have attacked young adults It is of interest that the first case of a defective child which I saw in New York City in 1941 was born of a mother exposed to this same epidemic in London in her second month of pregnancy The infant, when I first saw it, had bilateral cataracts and congenital cardiac disease As the child grew older, it was apparent that he was also deaf and mute

Following this same plan of research, Green and Dogramaci investigated the records of 434 children suffering from congenital heart disease and found a history of maternal rubella in four cases and an exposure to rubella in one case [37]

Almost all the articles dealing with maternal rubella and fetal disease are case reports Three papers, however, have appeared which attempt to attack the problem from another angle The report of Fox and Bortin is one of these [38] These authors approach the subject from the public health viewpoint and attempt to find out how many mothers have had German measles during their pregnancies with resulting normal offspring They went back over the records of the Milwaukee Health Department and investigated the cases of rubella reported during the years 1942, 1943, and 1944 During this period there were 22,226 reported cases Of these, 581 were re-

ported as married women, and it was possible to investigate 152 of these Among these 152, eleven had rubella during pregnancy, five before the second month, four from the second to the fourth month, one in the seventh, and one in the ninth month. Of these 11 cases, only one showed congenital disease, a stillborn, hydrocephalic infant born of a mother who had rubella in her first month of pregnancy None of the other ten infants had congenital malformations It is important to note that these results were all determined from data obtained from health department records and that there was no certainty as to the correctness of the diagnosis of rubella, a difficult diagnosis, especially in the absence of an epidemic

These findings are certainly at variance with those of Swan, who found percentages varying between 50 and 100 per cent, depending on the stage of pregnancy when the mother took sick One might conjecture that the virus in Milwaukee might be of a different type, but two cases with deformities have been reported from that city by Greenthal.[39]

The second article which approaches this subject from the statistical angle is that of Conte McCammon, and Christie.[40] These authors collected cases reported to date and could find 134 in which maternal rubella in pregnancy was followed by congenital malformation of the fetus. They also reported finding 20 cases of maternal rubella without fetal defects In four of these, the rubella occurred in the third month of pregnancy, in the remaining 16 it occurred after the seventh month. Among their conclusions are these "Further evidence to support the fact that rubella in pregnancy is a predisposing cause of congenital malformation was suggested by a further survey of our records as follows Maternal rubella was noted in 4.2 per cent of the cases of congenital abnormalities surveyed. This exceeds by at least ten times the actual case rate of maternal rubella for the child bearing age group in the population at large."[40]

In Prendergast's series from California, there were ten mothers who had rubella in the first trimester but only six of the infants had congenital defects [41]

Aycock and Ingalls investigated 1 300 cases reported to Boards of Health of two Massachusetts communities and found four cases where rubella occurred during pregnancy, two in the second month, one in the fourth and one in the ninth month.[16] Of the four offspring only one was defective. They combine their figures with those of Fox and Bortin and as a result show that about 25 per cent of the children are affected when the disease occurs in the first trimester When these figures are compared with those of Gregg and of Swan, it is evident that they differ completely

With the rubella syndrome so definitely established as an entity, it is natural that other virus diseases affecting the pregnant mother should be investigated There are now recorded in the literature a number of instances in which fetal defects have followed maternal disease other than rubella Swan in 1946 reported six cases of mumps in the pregnant mother, two in the first month of pregnancy, one in the fourth, two in the fifth, and one in the seventh [41] Curiously enough, the infants in every one of the cases showed some congenital defect These included corneal opacities, congenital cardiac disease, mongolism, microcephaly, nevi, and imperforate anus

Swan also reports two cases of herpes zoster in the mother, one in the fourth month and one in the sixth month of pregnancy In both cases the fetus was defective one case showing deaf mutism, heart disease, and microcephaly, the second showing myelocele, bilateral talipes, and right genu recurvatum. In two cases of scarlet fever, normal infants were born Swan reports two cases of varicella both in the seventh month of pregnancy, one of the babies being abnormal. Eighteen cases of morbilli were followed, four of which resulted in abnormal infants with heart disease in one case and heart disease, pyloric stenosis, and genu valgum in another The remaining were all normal children

In summing up his findings Swan says

> With regard to the effect on the fetus of other infectious diseases during pregnancy there is little evidence as yet to suggest that morbilli leads to congenital abnormalities though it is possible that it may be a cause of abortion. The question whether mumps and other virus conditions may be followed by congenital malformations remains open. As far as mumps is concerned, a number of defects have been recorded, but so far no definite syndrome, such as that associated with rubella, has emerged If other viruses are found to play a part in the etiology of congenital anomalies, we postulate that they will be confined to those which circulate at some stage of the infection in the mother's blood stream. The available evidence suggests that maternal infection during pregnancy with strict neurotropes—for example, poliomyelitis—which are apparently confined to axonic pathways and do not invade the blood stream has no effect in the infant born subsequently

Last year, several cases of smallpox occurred in New York City and, as a result, about 5 000 000 persons were vaccinated With our knowledge of virus infections, the question at once arose as to whether pregnant women should be vaccinated The statistics of the vaccination campaign have been analyzed by Dr Morris Greenberg of the New

York City Department of Health In a careful follow-up of the infants born to mothers vaccinated in the first four months of pregnancy, compared with a control group of those born to unvaccinated mothers, he has definitely shown that vaccination is a safe procedure during the first four months of pregnancy so far as the occurrence of congenital defects in the offspring is concerned [42]

Now that the knowledge that virus diseases may affect the embryo is well established, what can be done to prevent fetal damage? First, pregnant women, especially in their first trimester, should be warned to avoid contact with others suffering from such diseases Secondly, girls should be purposely exposed to rubella as one attack usually protects Third, the value of gamma globulin as a prophylactic agent for rubella must be investigated A study of this question is now in progress It is a complicated one and presents great difficulties, but it is felt that over a long period of time results may be obtained that will decide whether gamma globulin can be used for rubella as it is for measles If a large epidemic of rubella should occur, convalescent blood or globulin extracted therefrom might be obtained in sufficient quantity to test its efficacy

Mongolism has always been an intriguing problem for the geneticist, the endocrinologist, and the pediatrician. Although many theories have been advanced for its causation, none has proved satisfactory Recently, interest in this question has been revived by Ingalls of Boston [43] He was impressed by the fact that in Mongol children, many apparently unrelated congenital abnormalities may make their appearance He cites congenital heart defects, cataracts, polydactyly, darwinian tubercles, and malattachment of the mesentery If one accepts the concept that Mongolism is due to an endocrine disturbance, possibly pituitary disease, it is difficult to link this up with the occurrence of these defects One would have to suppose that the basic cause of Mongolism exerted its maximum effect at a particular period of gestation, for it is now commonly accepted that certain defects in the newborn infant occur only when the fetus is damaged at a definite period of fetal life Cataract results from damage in the sixth week, deafness from damage in the ninth week, cardiac anomalies from damage in the fifth to tenth week, and deformed teeth from damage in the sixth to ninth week

When one considers that ocular defects are not at all rare in Mongolian idiots and cardiac defects are found in 25 per cent or more, one cannot fail to be impressed by the similarity to the situation in the case of rubella Ingalls, therefore, believes that the question of maternal disease as a cause of Mongolism needs considerable investigation Davies and he reported seven cases of Mongolian infants whose mothers had the following illnesses during pregnancy influenza (second month), rubella (second month), mumps (second month), mastoiditis (second month), pleurisy (third month), grippe (sixth month), and purulent otitis media (second month) [44] Swan refers to four other cases, two observed by himself, one by Gregg, and one by Conte *et al*

Ingalls emphasizes the fact that cranial deformity, i e, brachycephaly and dwarfing of the tribasilar bone, is a constant feature in Mongolism and that it may be one of a series of other defects such as cardiac anomalies or changes in the bones of the hands, all of which together make up the clinical picture of the Mongol infant On this basis, he postulates that the condition of the mother during the first trimester of pregnancy may perhaps be responsible for Mongolism

I will mention briefly the important subject of the offspring of the diabetic mother The infant is, as a rule, markedly overweight and shows a tendency toward anatomic changes, especially cardiomegaly and excessive extramedullary erythropoiesis Neonatal mortality is high Until recently these findings have been attributed directly to the disturbance in the mother's carbohydrate metabolism

However, investigators, particularly H C Miller, have shown that diabetic women give birth to excessively heavy infants, even when these are born long before the onset of maternal diabetes [45] Even the cardiomegaly and extramedullary erythropoiesis have also been shown to occur in infants born prior to the onset of maternal diabetes It is also of interest that the frequency of congenital malformations has been noted to be high in children born of diabetic mothers

I have reviewed briefly some of the effects of disease of the pregnant mother on the offspring and have particularly stressed the role played by virus infections With the rapid development of virology, both in its clinical and laboratory aspects, there is certain to be a real advance in our knowledge of this subject To quote Warkany, "It is obvious that a better knowledge of the etiologic factors which lead to malformations will bring us nearer to the solution of the problem of prophylaxis"

PABA USED AS PROTECTION AGAINST SUNBURN

Protection from sunburn is achieved by para aminobenzoic acid ointment. PABA has greater ultraviolet absorptive power than salicylic acid. A 15 per cent concentration in Ruggles' cream, applied before exposure, prevents even highly sensitive skin from burning in intense sunlight or under irradiation of mercury arc lamps. None of the 32 subjects observed by Stephen Rothman, M.D, and A. B Henningsen M.D of the University of Chicago, had previously been able to remain long in the sunshine without harmful effects. No sunburn occurred when PABA was used

OUR MENTAL "ACHING BACK"

'Oh, my aching back, GI Joe's favorite and most symbolic slang phrase during the war, applies to the whole world now and will for some time to come.

So declares Dr William C Menninger, general secretary of the Menninger Foundation and chief consultant in neuropsychiatry to the Surgeon General of the Army 1943–1946

A kind of prescription for warding off "the aching back' in these days of heavy world and personal burdens and stresses is to be found in Dr Menninger's new book *Psychiatry in a Troubled World* (Macmillan) Dr Menninger refers to the mental and emotional troubles, rather than a physical backache

Drawing on his war experiences with the millions of "Joe's and Mary's from Brooklyn and Kokomo' who made up our huge war machine, he gives nine factors which helped the Joe s and Mary's stay normal in spite of war's stress and strain These same nine he believes, will help each of us meet our aching back problems in civilian life.

They are

1 Recognition of the existence of a struggle between the personality and the environment.

2 A job with a purpose

3. Teamwork. Working with a group helps the worker as well as the group is good for mental health

4 Leadership This works both ways too. Most of us have to work under someone but most of us also are leaders at times either as parents teachers, foremen, or presidents of clubs.

5 Intellectual growth, getting new ideas, learning new things.

6. Promotion, for the individual and for the family the neighborhood, the city the state and the nation.

7 Recreation

8 Religion. Like most psychiatrists Dr Menninger believes there is no antagonism between religion and psychiatry

9 Now awareness of emotional conflicts, of the occurrence of 'operational fatigue in civilian as well as military life

SIGNIFICANCE OF CHOLESTEROL IN CORONARY ARTERIOSCLEROSIS

ALFRED STEINER, M D , New York City

(From the Research Service, First (Columbia University) Division, Goldwater Memorial Hospital, Department of Hospitals, City of New York, and the Department of Medicine, College of Physicians and Surgeons, Columbia University)

CORONARY arteriosclerosis with its complications is the greatest single cause of death in this country today, as revealed by recent mortality statistics [1] Of the 3,040 physicians who died in the United States in 1947, approximately one out of three died of coronary arteriosclerosis [2] This problem merits far greater and more intensive investigation than it is now receiving

Progress in the study of arteriosclerosis in general has been greatly hampered by two erroneous clinical concepts the first that all types of arteriosclerosis are part of the same pathologic conditions, and second, that intimal arteriosclerosis is an inevitable consequence of aging

There are two separate and distinct processes included in the term arteriosclerosis, intimal arteriosclerosis and medial or Mönckeberg's sclerosis Intimal arteriosclerosis is of great importance because it results in reduction of blood flow to vital areas, such as the heart, brain, and extremities, and leads to clinical syndromes of coronary insufficiency and thrombosis, cerebral thrombosis, intermittent claudication, and gangrene of the extremities Intimal arteriosclerosis consists of irregular plaque formation which protrudes into the lumen of arteries On microscopic examination, the lesions consist of lipoid depositions beneath the endothelium of the intima, followed by the appearance of foam cells, fibrosis, hyalinization, necrosis, and calcification

Medial arteriosclerosis or Mönckeberg's sclerosis is limited for the most part to the media of the peripheral arteries and is characterized by medial degeneration, fibrosis, and calcification This type of lesion does not cause a reduction of blood flow and does not lead to any serious accidents but merely results in a loss of elasticity, dilatation, tortuosity, and increased rigidity of the vessel wall It is this type of arteriosclerosis which results in stiffness of the radial arteries that we clinicians so frequently palpate and erroneously conclude is indicative of intimal arteriosclerosis

Mönckeberg in his original description of medial sclerosis has emphasized that it is a separate process which cannot be correlated with the presence or absence of intimal arteriosclerosis [3] Sappington and Cook have more recently reached this same conclusion by examination of the radial arteries, coronary arteries, and aortas in the same individuals [4] For the purpose of this discussion, we can dismiss medial sclerosis from our consideration, and all further reference to the term arteriosclerosis is to include only intimal arteriosclerosis

There are some investigators who feel that intimal arteriosclerosis is an inevitable consequence of the aging process and that further study of this condition will not be fruitful However, there are many observations which indicate that such is not the case As more data become available, the occurrence of intimal arteriosclerosis in infants and children is not an uncommon finding Moreover, postmortem examination in elderly people reveals little or no arteriosclerosis at times In a postmortem study of 76 patients, age one through thirty-nine, dying of chronic nephritis, it was found that 96 per cent had intimal arteriosclerosis [5] In a recent report from the Army Pathology Department, 400 instances of coronary thrombosis were recorded in soldiers from the ages of nineteen to thirty-nine [6] Certainly these individuals did not succumb to senility The fatalistic attitude regarding arteriosclerosis has greatly retarded progress in the study of this disease

Numerous theories have been advanced to explain the cause of arteriosclerosis The one which seems to have the greatest experimental as well as clinical support has to do with cholesterol and abnormalities in its metabolism The emphasis on the significance of cholesterol in the development of arteriosclerosis results from three important observations (1) Windaus in 1910 showed by chemical analysis that the arteriosclerotic plaque is made up in large part of cholesterol and cholesterol esters, (2) Anitschkoff in 1913 produced lesions in rabbits similar to human arteriosclerosis by cholesterol feeding, and (3) certain disease states that result in premature, widespread arteriosclerosis, namely, poorly controlled diabetes, chronic nephritis, myxedema, and xanthomatosis, frequently show an elevated serum cholesterol [7 8]

Experimental Arteriosclerosis

Because arteriosclerosis cannot be adequately diagnosed and followed clinically, progress in the

The A Walter Suiter Lectureship
Presented at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City, General Sessions, May 21, 1948

study of this process is largely dependent upon the reproduction of the disease in experimental animals. The arteriosclerosis in rabbits following a high cholesterol diet is similar in many respects to human arteriosclerosis The development of the lesions in the experimental animal and in man is analogous both microscopically and grossly Chemical analysis of the plaques in the rabbit and humans give comparable results However, Duff and other investigators have emphasized three important objections to comparing the experimental lesions to those in humans (1) the distribution of the lesions of rabbits differs from that occurring in man, (2) the morphologic appearance of the lesions in rabbits resembles the early stages of arteriosclerosis in humans, but the more advanced type of lesions do not develop, and (3) cholesterol feeding does not result in significant hypercholesterolemia and arterial lesions in omnivorous animals such as the dog, cat rat, or monkey, whose diet normally contains cholesterol [9]

However, in a recent report from this laboratory, it was demonstrated that arteriosclerotic lesions in dogs similar in distribution and morphologic characteristics to human arteriosclerosis resulted from prolonged hypercholesterolemia.[10] The high serum cholesterol values were produced by the feeding of 10 Gm. of cholesterol daily to dogs whose thyroid function was modified by thiouracil administration

After the initiation of high cholesterol diet, the serum cholesterol levels of the dogs increased from control values of approximately 150 mg to an average of 400 to 450 mg When 0.8 to 1.2 Gm. of thiouracil was added to the high cholesterol regimen, the serum cholesterol values further increased to average approximately 1,100 to 1,200 mg Postmortem examination was performed on the dogs on the high cholesterol diet with and without thiouracil from twelve to sixteen months after the onset of the experiment. Fine elevated yellowish streaks were grossly visible in the abdominal aortas of the dogs on the high cholesterol diet without thiouracil Microscopic examination of the lesions revealed lipoid depositions beneath the intima, forming an early arteriosclerotic plaque.

Autopsy examination of the dogs on the high cholesterol-thiouracil regimen revealed extensive generalized arteriosclerosis. The lesions varied from small pinpoint, yellowish white elevated lesions to large coalescing plaques The process was most marked in the abdominal aorta and its branches There were extensive lesions in the iliac arteries, and the process extended down to the tibial arteries

The coronary arteries were diffusely involved with resulting narrowing of the lumen. A few plaques were grossly seen on the anterior leaflets of the mitral valve, as well as in the sinus of Valsalva. The arteries forming the circle of Willis contained scattered plaques

Microscopic examination of the lesions revealed foam-cell infiltration, thickening of the intima, and narrowing of the lumen, together with fibrous hyalinization, distortion or rupture of the internal elastic lamella, and calcification In addition, areas of hemorrhage into the wall of some of the arteriosclerotic plaques occurred

Animals fed thiouracil without cholesterol were free of arterial lesions

The arteriosclerosis produced in dogs meets the objections raised concerning the comparison of arteriosclesosis in rabbits to that in men. The distribution of the lesions in dogs is similar to that occurring in humans Cerebral and renal arteriosclerosis is part of the generalized arteriosclerosis of dogs as well as of man On microscopic examination, advanced as well as early stages of arteriosclerotic process were present

In summary, arteriosclerosis in young dogs similar to human arteriosclerosis has been produced by the feeding of cholesterol and thiouracil

Now that an acceptable laboratory tool is available studies are in progress to prevent or reverse the experimental arteriosclerosis Choline is one of the substances under investigation Since Best and his coworkers demonstrated that choline and its derivatives were effective in preventing or relieving "fatty" livers of rats on diets rich in fat or cholesterol the action of choline on experimental arteriosclerosis has been tested in our laboratory [11] Preliminary reports indicated that choline was effective in preventing arteriosclerosis in cholesterol-fed rabbits for a limited period, and, in addition, in some instances caused a reabsorption of the previously induced arteriosclerotic lesions.[12 13] A further study on the effect of choline on the prevention of experimental arteriosclerosis extended these observations. Kesten and Silberwitz and Andrews and Broun have also confirmed our original observations in the rabbit [14,15]

Serum Cholesterol Studies in Coronary Arteriosclerosis

Because of the significance of cholesterol in experimental arteriosclerosis and because of the finding of an elevated serum cholesterol in various diseases, such as poorly controlled diabetes, myxedema, chronic nephritis and xanthomatosis, that have premature and widespread arteriosclerosis, it was thought desirable to review the status of serum cholesterol in patients with coronary arteriosclerosis The literature on this subject is not conclusive. Several reports record an elevation of serum cholesterol while others do not.

The diagnosis of arteriosclerosis in many instances consisted of palpation of the radial arteries, evidence which proves the presence of medial sclerosis but is not indicative of intimal arteriosclerosis

However, before considering the question of serum cholesterol in coronary arteriosclerosis, it is desirable to comment on the normal serum cholesterol The range of serum cholesterol values in normal subjects is wide, depending on the chemical method employed Two technics most widely used are those of Bloor, in which the range of normal cholesterol varies from 175 to 300 mg per 100 cc , and the method of Schonheimer and Sperry, in which the range varies from 150 to 275 mg per 100 cc [16 17] The method of Schonheimer and Sperry is considered to be more accurate, although it is technically difficult and requires considerable facility before reproducible results are obtainable The ratio of ester to free cholesterol is constant, approximately 3 to 1 In a study with Dr K B Turner, it was demonstrated that in a group of relatively normal persons, the individual serum cholesterol remains quite constant from hour to hour, day to day, and month to month [18] During the period of a year's study, the deviation from the mean cholesterol for each patient was less than 10 per cent

As recently reported, frequently consecutive determinations of serum cholesterol for periods up to two years were made in 15 patients with coronary arteriosclerosis and in 15 relatively normal individuals [19] Thirteen of 15 patients with coronary arteriosclerosis had had a well-documented coronary thrombosis The remaining two individuals had typical angina pectoris with a positive anoxemia test for coronary insufficiency [20] The patients were not included in this study until at least six weeks had elapsed since the onset of the myocardial infarction A total of 914 serum cholesterol determinations were made, 572 on the patients with coronary arteriosclerosis and 342 in the normal individuals

The average serum cholesterol values for each of the relatively normal individuals varied from 214 to 334 mg , with a mean average of 254 mg for the group The fluctuations of the serum cholesterol, as measured by the standard deviation for the normal subjects, averaged 8 7

In contrast, the average serum cholesterol of the patients with coronary arteriosclerosis varied from 308 to 499 mg , with a mean for the group of 355 mg , 100 mg greater than the mean of the normal subjects In addition, the average standard deviation for the patients was 24 8, three times as great as the average standard deviation of the normal subjects

Although statistically these results are significant, it was felt desirable to have serum cholesterol determinations on a larger group of patients For this reason, a single serum cholesterol determination was made on 50 additional patients with coronary arteriosclerosis and on 50 additional normal persons of the same age group The average serum cholesterol value for the second group of patients with coronary arteriosclerosis was 336 mg , in contrast to 236 mg for the control subjects These results confirmed the previous observations

Since these studies have been reported, Lerman and White found that 22 of 28 patients with coronary arteriosclerosis under the age of forty had an elevation of the serum cholesterol [21] Boas has also reported that an elevated serum cholesterol is a frequent finding in patients with coronary arteriosclerosis [22]

In summary, the serum cholesterol level of patients with overt coronary arteriosclerosis is significantly higher than the serum cholesterol level in normal subjects in the same age groups In addition, the serum cholesterol level of patients with coronary sclerosis fluctuates widely

Effect of Diet on Serum Cholesterol

Leary and, more recently, Dock have advocated the restriction of dietary cholesterol so as to prevent or retard the development of arteriosclerosis [23 24] The evidence on which this suggestion is based relies chiefly on the experimental arteriosclerosis produced by excess feeding of cholesterol to rabbits, chickens, and dogs However, there are, in addition, other data which tend to suggest that diet has an important bearing on the development of arteriosclerosis In parts of the world where poor nutrition is prevalent, a low incidence of arteriosclerosis has been reported In China, Oppenheim and Snapper observed little arteriosclerosis even in persons dying at an advanced age [25 26] In Okinawa, Steiner, in a recent article on a hundred autopsies in all age groups, found only seven instances of minimal arteriosclerosis [27] Likewise, Wilens has recorded similar findings from Costa Rica [28] The diet in these countries is characteristically low in cholesterol, protein, and calories and is made up chiefly of carbohydrates of vegetable origin

The tendency for individuals who are obese to succumb more commonly to sequelae of arteriosclerosis and coronary or cerebral occlusions has been noted by analysis of statistics by life insurance companies [29] Wilens has also pointed out that obesity favors the presence of advanced arteriosclerosis as indicated in a study of 1,250 necropsies performed at Bellevue Hospital [28] French and Dock stated that 73 of 80 young soldiers dying of coronary arteriosclerosis had some degree of obesity [30] Wilens has also re-

ported a regression of the arteriosclerotic plaque in humans following weight loss or cachexia.[21]

It was, therefore, considered of interest to determine the effect of diets rich or poor in dietary cholesterol on the serum cholesterol level. In the first phase of this study, the response of the serum cholesterol of 35 patients with various diseases to a single meal rich in fat and cholesterol was determined. The method of study was as follows: blood for analysis was taken at 8 A.M. with the patient in the fasting stage. Breakfast consisted of fruit, two eggs, buttered toast, coffee, and 200 cc. of milk to which 20 Gm. of cholesterol had been added. Dinner and supper were served at the usual hours. Additional blood samples were taken at 10 A.M., noon, 4 P.M., and 8 A.M. the following day. The results showed clearly that little or no change in the serum cholesterol occurred during the course of twenty four hours, regardless of the feeding of a large amount of cholesterol.

In the second phase of this study, nine individuals were placed on diets high or low in fat and cholesterol. They were first given a diet containing 300 Gm. of fat for six weeks and then without interruption placed on a diet containing less than 50 Gm. of fat. In five of the nine patients, there was no increase in total serum cholesterol during the period of high fat feeding. In four cases, a slight rise seemed to occur. However, this increase was not striking. Furthermore, at a later time three of the patients were placed on the high fat diet for a second period, but at this time 10 Gm. of cholesterol in 200 cc. of milk was added to the regimen. No significant change resulted in the serum cholesterol levels.

The serum cholesterol values of the patients on a low fat diet were no different from those during the control periods.

This study has recently been repeated in four patients with coronary arteriosclerosis. After an initial control period the patients were given 100 Gm. of egg yolk powder containing 8 per cent cholesterol daily for six weeks. At the end of this time, the diet was changed to one low in cholesterol (butter, cream, egg yolk, and fatty meats were excluded) for six additional weeks. Only minor changes in the serum cholesterol levels were found. It was possible in this experiment to estimate the quantity of cholesterol actually absorbed and metabolized by determining the amount of sterol excreted in the stool. No significant differences in the sterol excretion occurred during initial control and high or low fat and cholesterol diet periods. It can, therefore be assumed that the dietary cholesterol was either metabolized or laid down in the tissues. The latter seemed unlikely because clinically there was no evidence of deposition of cholesterol in the body (total amount fed in six weeks exceeded 336 Gm.). With the serum cholesterol and fecal sterol content essentially unchanged, one might infer that the mechanism of cholesterol turnover in the body is very active and able to handle large amounts of exogenous cholesterol. If this were not so, then an elevation of serum cholesterol would be expected on a high cholesterol diet, and conversely, a fall in the serum cholesterol on a low cholesterol diet. Further studies of this problem by the isotope technic are indicated.

In the third phase of the effect of diet on serum cholesterol, ten patients with well-documented bouts of coronary thrombosis were placed on a low cholesterol diet for periods from four to fourteen months. Butter, egg yolk, cream, and fatty meats were excluded from the diet during the low cholesterol regimen. Oleomargarine, a vegetable fat, was allowed. The patients were followed in the outpatient department, so strict adherence to the diet may not have been observed. However all the patients were most cooperative. Serum cholesterol determinations were made at biweekly intervals, or at monthly intervals. Preliminary results of this study indicate that the serum cholesterol levels were not significantly different from the determinations of the initial regular diet period. Considerable fluctuations of the serum cholesterol level occurred during both the period of regular diet as well as during the low cholesterol diet period. Although the serum cholesterol levels were not significantly altered by the lowered cholesterol intake, it is not possible to judge adequately whether this regimen resulted in any change in the clinical status of the patients.

The recent demonstration by Rittenberg and his coworkers that cholesterol can be synthesized in the body from acetate—a substance formed in the metabolism of fat and possibly from glucose and protein—is pertinent to the problem of reduced cholesterol intake.[23] If the body synthesizes excessive amounts of cholesterol, the restriction of intake would be to little avail. However, the overburdening of an already disturbed cholesterol metabolism by excessive cholesterol ingestion might be harmful. Further studies are necessary before a final evaluation of this problem can be made.

Summary

An acceptable laboratory tool is now available to test methods of preventing or curing arteriosclerosis, since arteriosclerosis, similar to that occurring in humans, has been produced in young dogs by the feeding of cholesterol and thiouracil.

Choline has been found to have a protective action in preventing experimental arteriosclerosis in rabbits for a limited time.

A study of patients with overt coronary arteriosclerosis reveals that the serum cholesterol levels are higher and inconstant in contrast to lower and more stable values in normal individuals of the same age group An attempt to evaluate the significance of the cholesterol content of the diet in patients with coronary arteriosclerosis has been made It has been shown that within the limits of this study, varying the cholesterol content of the diet fails to produce significant alterations of the serum cholesterol levels Preliminary results indicate that large amounts of dietary cholesterol can be absorbed from the gastrointestinal tract without alteration of the serum cholesterol or clinical evidence of cholesterol deposition in the tissues Further studies in cholesterol metabolism using tagged atoms are needed

MILITARY VALUE OF ACTUARIAL TECHNICS

Armies can now predict disease and noncombat casualties and measure their manpower and material needs well into the future through the application of actuarial technics, a process applied during the recent war, E A. Lew and F A. Weck of New York, both of the actuarial department of the Metropolitan Life Insurance Company, said in a paper presented before the Centenary Assembly of the Institute of Actuaries of London on June 25

Citing the experience of World War II when the U S Army made extensive use of actuarial procedures in planning their manpower needs and meeting their general requirements, Mr Lew and Mr Weck said that measurement of disease and noncombat casualties constitutes a major need, as they represent the great bulk of the casualties This is even true, they said, in periods of major battle operations In the peak casualty period between June 6, 1944, and VE Day, when 450,000 wounded were admitted to hospitals in European and Mediterranean theaters, those were only 35 per cent of the total number of patients admitted from all causes

The actuarial studies showed that there is no fixed rate of casualties but that it is related to numerous factors, including environmental conditions, special hazards, seasoning of troops, and nature of missions In the last war, as the troops became seasoned, the army as a whole showed a constantly decreasing hospital admission rate from disease and noncombat disability

The admission rate was 2 4 per day per 1,000 in 1943, then dropping to 2 1 in 1944, and to 1 9 in 1945, the latter being only slightly above the rate for the highest year of the 1930's

Hospitalization represents a multiple military problem, the actuaries pointed out, involving not only adequate placement of facilities and the procurement of sufficient medical services but also the adequacy of manpower for the active forces During World War II, for example, the U S Army medical requirements involved handling 15,000,000 admissions to hospitals, 3,200,000 cases treated in dispensaries, and 130,000,000 outpatient treatments for those not excused from duty

FALSE SEROLOGIC TESTS FOR SYPHILIS IN INFANTS OF TREATED MOTHERS

DARNEY MOON ADAMS M D , New York City

(From the Bellevue Hospital)

TO ESTABLISH the diagnosis of syphilis in the newly born infant several procedures may be necessary These include *serologic tests*, physical examinations, roentgenograms of the long bones, dark field examination of scrapings from the umbilical vein, and dark field examination of any suspicious lesion on the skin or mucous membrane. The limitations of serologic tests as a means of diagnosis have long been recognized In 1915, nine years after the *Wassermann test was* devised, Fildes reported on its unreliability in the diagnosis of syphilis in the newborn.[1] Since that date many observers have pointed out that a positive serology in the early weeks of life may reverse the negative, the infant remaining free from all signs of the disease, and a negative may reverse to positive, the infant developing typical signs of congenital syphilis

The present study is based on the serologic findings of 470 infants of treated syphilitic mothers examined during the past three years at Bellevue Hospital, New York City, under the joint auspices of the Pediatric Department and the Rapid Treatment Center The plan of follow-up consisted of serologic tests, roentgenograms of the long bones, and a physical examination during the first week of life If all findings were negative, these procedures were repeated at intervals of four weeks until the age of six months From the sixth month to one year, serologic tests and physical examinations were made at intervals of three months Infants showing positive serology without other evidence of infection were examined at weekly intervals until the diagnosis of syphilis had been eliminated or confirmed Thereafter, the follow-up was continued on the regular routine It was impossible to adhere to this schedule in all cases. Blood specimens taken on infants less than a week old were frequently reported hemolyzed or of insufficient quantity Moreover some infants were born in hospitals in which no early tests were taken The majority of the cases received their first serologic test during the second month of life

Routinely, a Wassermann and a precipitation test were performed on each specimen If one or both of these were positive, the second test was titrated, and titrated tests were repeated until the diagnosis was established Cases showing a plus-minus or doubtful on the first check and negative on the second were not considered false positives A small percentage of cases had negative serologic tests up to eight or twelve weeks of life and subsequently gave one positive reaction which, within one to four weeks reversed to negative and remained negative in subsequent examinations Such cases were excluded from the study and were *interpreted as false positive* reactions, possibly due to an intercurrent febrile or toxic condition. On the same basis delinquent *cases whose serologies* were not checked until after the third month of *life* and who showed a positive reaction which reversed to negative were also excluded

Although this report deals primarily with the incidence of false positive serology, all instances of *so-called false negative tests* were recorded. The occurrence of negative serologic tests in the early weeks of life reversing to positive with the development of syphilic manifestations in the infant *was rare in the group studied* In the total 470 cases, only 5 (1 0 per cent) fell in this category, of these one showed a typical reversal in one acquired syphilis was probable, and in three, who *had had negative tests at Bellevue, a diagnosis of* syphilis was made at other hospitals These cases were not suitable for tabulation because of lack of serologic data

TABLE 1.—INCIDENCE OF FALSE POSITIVE SEROLOGY IN INFANTS OF TREATED MOTHERS (1945–1947)

Age at Earliest Serologic Test	Infants Tested	Serologic Results		
		Negative	Positive	Per Cent Positive
1st month	146	77	69	47 3
2nd month	232	216	16	6 9
3rd month	87	86	1	1 15
Total	465	379	86	18 5

Table 1 shows the results of serologic tests in 465 infants of treated mothers Four hundred and sixty two mothers had received penicillin therapy and three, arsenicals and bismuth. One hundred forty-six infants were examined in the first month of life, of these 77 gave a negative and 69 (47 3 per cent) a positive reaction which reversed to negative Two hundred and thirty two infants received their first *serologic test* during the second month of life, of these 216 gave a negative and 16 (6 9 per cent) a false positive reaction When the first serologic test was taken during the third month of life in 87 cases, 86 gave

Presented at the 142nd Annual Meeting of the Medical Society of the State of New York, New York City Section on Dermatology and Syphilology May 20, 1948.

a negative and one (1 15 per cent) a false positive reaction For the total group, 18 5 per cent gave false positive reactions The actual occurrence of such reactions in the newborn, however, is presumably more accurately represented by the 47 3 per cent found in the infants examined during the first month of life

The duration of false positive serologic reaction in the infants varied from twenty-four days to fourteen weeks Weekly follow-up of the newborn was unsuccessful in so many cases that the analysis of the duration was based on tests taken at four-week intervals Thirty-one of the total 86 had become negative at four weeks of age In 55 cases which remained positive at four weeks, 32 had become negative at eight weeks In 23 cases which remained positive at eight weeks, 17 had become negative at twelve weeks In six cases with positive serologic tests at twelve weeks, four had become negative at fourteen weeks

Of the total 86 infants with false positive serologic tests, 36 per cent had reversed to negative at the age of four weeks, 74 5 per cent at eight weeks, 93 per cent at twelve weeks, and 97 7 per cent had reversed to negative at fourteen weeks Of the two cases whose serology was positive at fourteen weeks, one had a negative Kahn and a three plus Wassermann The other had a four plus Mazzini and a four plus Wassermann The latter case presented several points of interest

Case Report

The mother had been treated two years prior to pregnancy with arsenicals and bismuth The amount of her treatment could not be ascertained Her serology was four plus The patient, her first pregnancy, was born at term A serologic test on the sixth day of life was four plus Titered Wassermann and titered Mazzini tests on the fourth week of life were positive to 1 to 16 dilution Roentgenograms of the long bones were negative, and the infant was normal. Weekly examination showed a slight but consistent drop in titered Wassermann and Mazzini tests, negative roentgenograms, normal gain in weight, and negative physical findings At fourteen weeks and two days (100 days) all findings were normal except the serologic tests, which were four plus in both the Wassermann and Mazzini Unfortunately, the patient did not return for reexamination until twenty-one weeks of age, when her serology was negative and other findings were normal. On the twenty-sixth week of life the serologic tests were again negative, and all other findings were normal

To ascertain the relationship of the time of the mother's treatment and the occurrence of a false positive serology in the infant, 110 cases in which accurate information on the mother's therapy could be obtained were reviewed In this series one mother was treated with arsenicals and bismuth, 109 received penicillin All infants were examined before the third month of life The results are shown in Table 2

In nine cases of mothers treated prior to pregnancy, eight of whom received penicillin and one arsenicals and bismuth, seven infants had negative serologic tests and two infants (12 2 per cent) false positive tests In 25 cases of mothers treated in the third and fourth month of pregnancy, 21 infants had negative serologic tests and four (16 0 per cent) false positive tests In 30 mothers treated in the fifth and sixth month of pregnancy, 23 infants had negative serologic tests and seven (23 3 per cent) false positive tests In 46 cases of mothers treated in the seventh and eighth month, 25 infants had negative serologic tests and 21 false positive (45 7 per cent)

The first group of nine mothers treated prior to pregnancy is too small to be of statistical value, but the second, third, and fourth groups showed an increasing percentage of false positive tests in infants whose mothers were treated late in pregnancy

Correlation was attempted of the mothers' serologic test with that of the infants taken on the same day and during the first week postpartum Such comparison could be made in only fifteen cases Of these, eight gave identical results for mother and infant In four, the mother's serology gave a higher titer and in three a lower titer In one case the mother's serologic test was negative one month before delivery and one month after delivery, while the infant's test gave a false positive reaction There were three sets of twins among the cases studied In two, both infants had negative serologic tests In the third, both gave a four plus reaction to Kahn and Wassermann tests on the eighth day of life, a two plus at the fourth week, and negative at the eighth week, the serologic reactions following identical patterns in each case

TABLE 2.—Relationship of Time of Mother's Treatment to Serology of Nonsyphilitic Infants in 110 Cases Tested During First Month of Life

	Prior to Pregnancy			Third or Fourth Month of Pregnancy			Fifth or Sixth Month of Pregnancy			Seventh or Eighth Month of Pregnancy		
	Negative	Positive	Total	Negative	Positive	Total	Negative	Positive	Total	Negative	Positive	Total

Per cent	77 8	22 2	100	84 0	16 0	100	76 7	23 3	100	54 3*	45 7	100

* Penicillin therapy used in all cases except one, which was treated prior to pregnancy with arsenicals and bismuth.

Although the occurrence of false positive and false negative serologic tests in the newborn is mentioned by many authorities, statistics of incidence are comparatively rare [2-5] Ingraham in a 1941 publication, prior to penicillin therapy, reported 16.2 per cent false positive and 4 per cent false negative serologic tests on infants examined during the first ten days of life.[4] His more recent publication on penicillin therapy in pregnancy records 38 per cent false positive reaction in infants of treated mothers [5]

To compare further the incidence of false positive serologic reaction in the offspring of mothers treated with arsenicals and bismuth with the incidence in penicillin-treated mothers, the tests taken in the Bellevue Pediatric Clinic from 1940 to 1943 were reviewed One hundred thirty six infants of mothers treated by the former method were examined during the first two months of life Of these, 13 (9 6 per cent) gave positive serologic tests which reversed to negative. This figure is probably 30 to 40 per cent too low because few infants were tested in the first week of life Allowing for this discrepancy, however, the offspring of penicillin-treated mothers gave a much higher ratio of false positive serology

Comment

The percentage of false positive serologic tests in the cases reviewed and compared with the reports made on the offspring of mothers treated with arsenicals and bismuth would indicate that with penicillin therapy in pregnancy a greater number of infants will give false positive reactions This is presumably due to the fact that an amount of penicillin adequate to cure syphilis in the mother can be given in a short time and is equally effective in preventing syphilis in the infant when administered prior to pregnancy or in the first second, or third trimester [6]

Whether the positive serology of the newborn infant reversing to and remaining negative represents a transfer of the reagin of the mother's blood to the infant, or whether it indicates persistence of the positive serology of syphilitic fetus treated and cured in utero by therapy administered to the mother during pregnancy, is not susceptible of proof in any given case. Several investigators have demonstrated that penicillin is transmitted through the placenta and is present in the fetal blood [7,8] The high percentage of false positive serologic tests in the infants of mothers treated with penicillin late in pregnancy suggests that penicillin so transmitted to the fetus has cured syphilis in utero This probability is discussed by Speiser in a recent publication.[6]

In cases of mothers who have secondary syphilis during pregnancy and who receive treatment in the eighth month of pregnancy, it seems highly probable that the false positive of the infants is not properly termed "false" but is evidence of a treated syphilitic infection contracted and cured in utero In cases of mothers who are treated prior to pregnancy and received no treatment during pregnancy, it seems probable that a positive serologic test on the infant, which reverses to negative represents a transfer of the reagin of the mother's blood If these possibilities are accepted, the so-called false positive serology of the newborn has a dual cause

Summary

1 A report on 470 infants of treated syphilitic mothers examined within the first three months of life for serologic, clinical, and roentgenologic evidence of syphilis is presented

2 False positive serologic tests were found in 47.3 per cent of infants tested in the first month of life, in 16 per cent of infants tested in the second month of life and in 1.2 per cent of infants tested in the third month of life.

3 False negative reactions were found in five cases or 1 per cent of the total. In one of these syphilis was probably acquired

4. The duration of false positive serologic tests varied from twenty four days to fourteen weeks Of the total, 36 0 per cent had become negative in four weeks, 74 per cent in eight weeks, 93 per cent in twelve weeks, and 97 7 per cent in fourteen weeks

5 Correlation of the number of false positive serologic tests with the time of mother's treatment shows a higher percentage in the infants of mothers treated in the last trimester of pregnancy

6 Compared with statistics based on mothers treated with arsenicals and bismuth, a greater number of false positive serologic tests can be expected in the infants of mothers treated with penicillin.

7 The question of false positive serologic tests in the newborn representing a transfer of reagin of the mother's blood or the persistent positive serologic test of syphilitic fetuses treated in utero is discussed

THE USE OF METHYLCELLULOSE AS A BULK LAXATIVE

KARL SCHWEIG, M.D., New York City

IN AVERAGE practice, many patients are observed whose chief or secondary complaint is constipation. One gastroenterologist noted an incidence of 45.2 per cent in a series of 5,000 private patients, while others have found an even higher percentage.[1] Gastroenterologists believe that chronic or atonic constipation may be due to improper diet, vicious habit formation, inadequate water intake, nervous factors, etc. In most instances, this type of constipation may be controlled by correct diet, increased water intake, or by correcting the patient's mental attitude through an explanation of the simple rules of bowel hygiene.[1,2] For the patients who fail to get the desired effect from such a regimen or who fail to abide by instructions, laxatives are frequently necessary.[3] For those patients who definitely require laxatives, the present trend in prescriptions has been away from the irritant cathartics toward the hydrophilic colloids.[1,4]

Aside from dried fruits frequently included in the diet to provide bulk, the usual hydrophilic colloids are principally agar, sodium alginate (kelp), acacia (acacia Senegal or gum arabic), tragacanths (Astragalus), karaya (false or Indian tragacanth derived from the tree Sterculia urens), and psyllium (Plantago psyllium, known as French or Spanish psyllium seed, and Plantago ovata, known as Blond Psyllium or Indian Plantago Seed).[5]

Gray and Tainter, in a comparative study of the colloid laxatives, concluded that agar is one of the least effective, while tragacanth and psyllium derivatives are considerably more efficient.[6] They concluded that tragacanth derivatives exert their laxative action primarily through colloidal swelling, while purified psyllium products add to their lesser swelling a mild irritant effect from their breakdown products.

The recent development of some synthetic mucilages, such as methylcellulose, provides a hydrophilic colloid with excellent possibilities as a laxative. Laboratory studies have shown that methylcellulose is nontoxic to rats when fed over prolonged periods of time.[7] It was also demonstrated that methylcellulose passes through the digestive tract of humans virtually unchanged, as it may be recovered almost entirely from the feces.[8] Further theoretic advantages claimed for this synthetic chemical are that it is not absorbed from the intestinal tract, that it is not broken down by chemical enzymes, and that it is nonantigenic. In addition, there is a high degree of chemical uniformity, frequently lacking in the natural gums.[9] Methylcellulose also differs from the natural gums in the way in which it takes up water. Whereas the latter take up water like a sponge, limited by their individual ability to swell, methylcellulose forms a colloidal solution in any given amount of water, the viscosity varying from a thin, demulcent liquid to a soft, smooth gel. This characteristic should make it virtually impossible for methylcellulose to produce an impaction, a disadvantage occasionally observed with the natural gums.

Tainter first investigated the use of methylcellulose as a colloid laxative and found that 10 Gm. per day approximately doubled the volume of the stool. The stools were soft and easily passed without colic or griping.

Experimental Procedures

The theoretic and preliminary experimental evidence indicated that methylcellulose* should approach the ideal as a colloid laxative. In order to evaluate further its clinical effectiveness and to determine the dosage required, a study was undertaken. Thirty-seven patients were given the drug for relief of acute and/or chronic constipation, that is, for the relief of a delay in defecation which brings discomfort, worry, or indigestion. It should be noted that subjects for this study were taken at random from routine office practice.

Patients were instructed to take two tablets (1 Gm.) or 2 teaspoonfuls (6 Gm.) at bedtime with one or two full glasses of water. In some instances, it was necessary to increase the initial dose of medication used before a reasonable therapeutic effect was achieved, such increases, if any, being included in the accompanying table. Patients did not take more than two full glasses of water at the time of administering medication, because several complained of the difficulty of drinking larger quantities. It should be further noted that all of these 37 patients were seen and examined at least once every two weeks and that most of them were seen at intervals of one week.

Results

In general, the therapeutic results observed were very good as tabulated (Table 1). In 23 cases (62 per cent) results were "excellent," i.e., a normal soft, bulky stool was passed without griping, cramping, or tenesmus, at least once a day. In 11 cases (30 per cent) results were "good." These patients passed five or more

* Supplied in the form of 0.5 Gm. tablets or as granules by the Maltine Company under the trade name, Cellothyl.

TABLE 1.—RESULTS OF TREATMENT OF 37 PATIENTS WITH METHYLCELLULOSE

Case Number	Sex	Age	Duration of Constipation	Habitual Use of Laxatives or Enemas	Dosage of Granules (Teaspoonfuls)	Dosage of Tablets	Duration of Administration	Therapeutic Results: Excellent	Fair	Poor	None

34	F	32	5 years	Yes		3–4	30 days	X			
35	M	3*	12 weeks	No		3	30 days	X			
36*	F	24	3 weeks	No		3	140 days		X		
37	M	34	5 years	Yes		4	21 days	X			

* Pregnant.

stools a week, used no other laxative or bowel movement aid, and declared themselves comfortable. In only 8 per cent were the results unsatisfactory where no change in bowel habits was noted and no relief from constipation was effected

Four of the patients under observation were pregnant In two of these results were "excellent" and in the other two "fair"

The only adverse effect noted was that of nausea and, occasionally vomiting at the time of swallowing or attempting to swallow the granules Since these patients showed no symptoms of nausea or vomiting on swallowing tablets, the nausea was no doubt caused by the mechanical difficulty of swallowing the light-bodied, floating granule Patients who continued the medication for the longest periods of time used the tablets in preference to the granules It was also observed in this same group that constipation was controlled by dosages three to four times weekly None of them felt the need for daily medication

At no time did I observe clinically any systemic change in these or any of the 37 patients although the duration of administration of medication varied from three to two hundred forty days Patients were comfortable and had no griping or cramping effect following the use of the tablets nor had they any other gastrointestinal complaints

Summary

Methylcellulose in dosages of 1 to 6 Gm. daily proved effective for the relief of chronic or acute constipation in the majority of the 37 cases Its use resulted in the passage of a normal, soft bulky stool without griping, cramping, or tenesmus in most cases Its prolonged use (up to eight months) did not produce evidences of systemic changes or toxicity

THE EARLY CARE OF HAND INJURIES SOME COMMON DIFFICULTIES

CONDICT W CUTLER, JR , M D , New York City
(From the Roosevelt and Goldwater Memorial Hospitals)

THE OUTCOME of any injury of the hand is in large measure determined by the nature of the treatment rendered by the physician who first deals with it definitively The significance of this fact is apparent when it is recognized that not only every surgeon but every general practitioner is called upon at some time to deal with injuries of the hands His professional equipment should, therefore, include a familiarity with the principles of their proper treatment

It would be a basic error to consider injuries of the hand as lying in the field of "minor surgery " This concept may lead to the relegation of such conditions to the less experienced men on hospital and clinic staffs and, in general practice, to the assumption of responsibility for them by physicians of relative inexperience in this field This is not to say that only the older men on clinic staffs should deal with injuries of the hand Wide experience and expertness in abdominal or thoracic surgery, for example, are not necessarily qualifications for this work, and even the surgeon who is renowned for his skill in such fields may not necessarily be best qualified to deal with the injured hand It does imply, however, that in each clinic or hospital staff there should be at least one man who has interested himself in this type of work, who has familiarized himself with the anatomy and physiology of the hand, and who has kept abreast of the development in this field He should be responsible for the proper management of these conditions and should be charged with the continuing instruction, supervision, and guidance of residents, interns, and students in matters of hand surgery

Another error inherent in the "minor" concept is that of neglect and delay on the part of the patient or of temporizing on the part of the doctor or both No injury of the hand should be regarded as of minor consequence It is necessary only to be reminded of the distressing and disabling results that have been seen to follow the neglected pinprick or the disregarded blister It is arresting to realize that every crippling purulent tenosynovitis, every major destructive cellulitis of the hand was, at the start of its career, a "minor" injury The point of view which would classify injuries (and infections) of the hand as "minor surgery" would imply that it is permissible to repair hand wounds (even to unite divided tendons) in emergency rooms and to conduct the drainage of infections or the search for foreign bodies in outpatient departments Such an attitude might well lead to difficulties whether the work is done in hospitals or undertaken in the clinics of industrial plants or in the offices of physicians

To go from the general to the particular, observation over a period of years emphasizes some of the more common difficulties which may arise in the management of hand injuries These are evidenced by cases admitted to our hospitals for their correction or for later reconstructive surgery

Burns

During recent memory the treatment of burns of the hand has run the gamut from carron oil and other greases, through the period of tannic acid, supplemented later by dyes and escharotics, the period of active débridement, the period of local antiseptics and antibiotics, and back to bland and protective grease again There has been some enthusiasm for each of these methods, and in turn their shortcomings and disadvantages have led to the abandonment of all but the last

All the salient and distinguishing features of the present accepted treatment are important in determining the ultimate result [1] Strict aseptic technic in the performance of dressings from the very start, gentle and nontraumatizing cleansing, the avoidance of irritating antiseptics, the application of an effective pressure dressing with separation of the fingers, the maintenance of the hand in the proper position of function, and noninterference with the initial dressing for a period of ten days or more are not safely to be disregarded Important also is the dictum of masking and strict asepsis while performing dressings, and the policy of the application of skin-graft covering at the earliest possible moment When an extensive but nicely granulating wound is present with satisfactory epithelization at its margins, the temptation is strong to allow healing to progress without the bother of grafting Such a policy, however, leads to the prolongation of superficial infection, lengthened immobilization and disability, and ultimately to increased cicatrization and perhaps contractures

Puncture Wounds

The neglect of minor puncture wounds by patients is proverbial Little notice is taken of them other than perhaps to "suck out the

Read at a meeting of the American Society for Surgery of the Hand Chicago Illinois January 23, 1948

poison" (often adding contamination by mouth organisms in the process) and possibly to dab on an ineffective antiseptic The late results of many such injuries are too familiar Among the most deplorable of this type of wounds are those inflicted by human teeth The patient often fails to seek aid until cellulitis is well established and, when he does will more often than not give a false history of the injury, claiming contact with a wall or door or some hurt connected with his occupation as the cause The physician who has seen a few of these tooth wounds will not be deceived and will at once recognize the condition for what it is by its characteristic appearance and odor In deference to the severity of such infections it was the earlier teaching to treat these injuries by the application of strong antiseptics or even of nitric acid or other cauterizing agents

Such treatment, now proved as ineffective as it was painful, ignored the primary requisites of adequate ventilation and the careful removal of devitalized tissue In tooth wounds of the knuckles these requirements demand an incision extending some distance up the dorsum of the hand to expose injured and contaminated tendon and paratenon withdrawn into the dorsal subcutaneous space when the clenched fist is opened These measures, plus the local application of moist dressings with zinc peroxide paste and the generous systemic exhibition of penicillin, have proved not only the most effective treatment for the case with established infection but may be considered obligatory even in the fresh case as the best insurance against invasive infection which, without them, will almost certainly develop [2]

Foreign Bodies

The metallic foreign body imbedded in the tissues of the hand that shows so clearly on the x-ray film offers a tempting target for removal Such a search, however, conducted without accurate localization or surface marking in a bloody field with inadequate lighting and exposure perhaps under local anesthesia and possibly without exact familiarity with the anatomy of neighboring structures, may prove anything but rewarding Such attempts may lead to fatigue, discouragement and failure leaving besides the foreign body traumatized tissue and perhaps added infection as their results. It is undoubtedly true also that some foreign bodies small and deeply imbedded may be innocuous and are much better left where they are

On the other hand, the nonopaque foreign body such as a fragment of wood or glass easily lies undetected and unsuspected in the depths of an inadequately débrided wound to make its presence known later by continuing inflammation or a persisting sinus tract

Lacerations

Due to wartime experience the values of prompt débridement and closure of lacerated wounds of the hand are now more generally recognized than was formerly the case The chief difficulty in their management lies in the matter of accurate evaluation of the injuries sustained Complete division of a tendon is not easily missed Failure to visualize the structures or at least to test tendon function against resistance, may result in the missing of the partial division of a tendon which will subsequently pull completely apart Division of intrinsic nerves of the hand and particularly of the digital nerves, may readily escape detection

The importance of undertaking the necessary wound examination, débridement suture, or repair of structures under optimum conditions of anesthesia, asepsis, hemostasis, lighting, assistance, and equipment cannot be overemphasized The lack of some or all of these factors may lead to incomplete investigation, inaccuracy, and such technical errors as the confusion of tendon and nerve in effecting union of divided structures

Methods of primarily repairing severed tendons vary considerably, as does the choice of suture material [3] The values of nonabsorbable material and the advantages and technic of the wire pull out stitch, as devised by Bunnell, have been amply demonstrated [4] Even with these advantages, surgeons have yet to be completely satisfied with the results of any method yet devised for the primary repair of a flexor profundus tendon when divided within the digital canal.[5] Certainly any chance of success is virtually eliminated when a divided flexor sublimis is repaired within the canal at the same time

The principles of the care of the hand following tendon injury and repair require emphasis It was, at one time the vogue to encourage the earliest possible active motion of repaired tendons "to prevent adhesions" until the contributions of Koch and Mason led to a better understanding of the physiology of healing of these structures and a recognition of the fact that three weeks of immobilization are necessary for firm union Wherever immobilization is practiced, the importance of the maintenance of the position of function must always be regarded A source of trouble may be avoided by not placing the splint on the same aspect of the hand and forearm as that of the repaired tendon where it would provide an immobile firm resistance against which the tendon might inadvertently test the strength of its union

Recognition of nerve injuries requires a work

ing knowledge of the motor and sensory functions of each within the hand, a sufficient familiarity with their anatomy to be able to find and identify the structures readily, and a careful investigation of the wound for this purpose [6] The proper primary union of severed nerves in the hand or fingers is a delicate business requiring optimum conditions for its performance Yet the importance of effecting it needs repeated emphasis The repairing of severed digital nerves may be overlooked most easily Following repair of motor nerves, the need for appropriate splinting to protect the denervated muscles against the pull of their physiologic opponents and their continued care to prevent serious atrophy are matters of great importance in the ultimate restoration of usefulness [7]

Traumatic Amputations

The amputation or partial amputation of a digit is one of the commonest industrial accidents The removal of an almost-severed finger forthwith seems hardly defensible, since experience has shown that the light suturing and adequate protection of such fingers, without attempt at immediate formal repair of their deeper structures, not infrequently results in their salvage for later restoration to usefulness

As there are now several well-recognized expedients for maintaining useful finger length and bringing about healing of the stumps of complete traumatic amputations, immediate re-amputation with flap formation can hardly be justified The resulting additional shortening, often including the sacrifice of a useful interphalangeal joint, now seems unwarranted, even on the basis of saving time, since the slightly shorter immediate disability must be purchased at the cost of a permanent diminution of useful function [8] Immediate grafting, the formation of various sorts of local covering flaps, or the open treatment to establish good granulations with later resort to grafting, are all methods which conserve length and function without great expenditure of time

Fractures

Simple bone injuries of the hand may occasionally escape detection This is particularly true of injuries to the metacarpal and carpal bones, because the resultant deformities are not readily apparent and because the tenderness and soft part swelling incidental to the trauma may obscure the characteristic signs Even the usual x-ray study may fail to reveal such fractures as those of the carpal navicular or the less common injuries of other carpal bones Their recognition by four-way plates and immobilization for a period of ten to twelve weeks will spare many prolonged disabilities or operations for fragment removal [9 10]

In the more obvious fractures of the long bones the greatest difficulties occur in the securing and maintaining of satisfactory reduction Flat splinting, now recognized as ineffective and harmful, has given way to traction in the position of function in the management of these conditions The advantages of skeletal traction, in appropriate cases, have been well demonstrated, and the various practical methods devised for its employment consitute a valuable contribution to the management of these fractures [11]

Major Injuries

The difficulties cited in dealing with lacerations, amputations, and fractures have even greater significance in those major traumas which may involve any combination of these injuries plus, in some instances, crushing and burning The importance of prompt débridement in these conditions is well recognized, but it should not be pursued with such enthusiasm as to sacrifice potentially viable tissues [3] The desire for thoroughness may well lead to excessive excision, which, in the compact and delicate structure of the hand, readily becomes injurious This is particularly to be guarded against in dealing with bone fragments In this respect it would seem that the same criteria might well be invoked as those employed in dealing with wounds of the face Certainly every bit of tissue that can safely be preserved should be spared, for it will contribute materially to a satisfactory result ultimately Whatever later reconstructive surgery may be contemplated in such conditions, the importance of the earliest possible skin coverage merits continued emphasis if the disabling effects of prolonged sepsis, deep scarring, and fibrosis are to be avoided

Summary

The benefits of the recognition and avoidance of the common difficulties involved in the early care of hand injuries, particularly important in a day of many industrial and transportation hazards, will be increasingly reflected in shortened periods of disability, conservation of important hand function, and the avoidance of many formidable reconstructive procedures

THE PHYSICIAN AND THE VENEREAL DISEASE PATIENT

LESLIE E LUEHRS, M D , New York City

(From the Youth Consultation Service)

IN SPITE of the activity of public clinics for handling the venereal diseases, as well as facilities for industrial workers and for men in military service, still a large part of the treatment of venereal disease patients rests with the general practitioner Often it is he who makes the first diagnosis, even though he may send the patient elsewhere for treatment. It is he who gets the impact of the patient s response to the discovery of the infection and initial anxiety It is he who is the actual fieldworker and casefinder for the health departments. And it is his skill or lack of skill in dealing with the patient that often determines the future success or failure in the total handling of the problem Too little attention has been given to the important part he may play in a program of eradicating the disease

It is no new idea—although the advent of psychosomatic medicine has emphasized it—that the art of medical practice is twofold, the treatment of a disease and the treatment of a person The development of modern science however with its laboratory technic, has tended to depersonalize this treatment to the extent that medical treatment can come close to being a mechanized craft rather than an art Diagnosis is based on work done by laboratory technicians who may never see the patient The old time doctor collected his materials himself and, in so doing, was able not only to explain the reason and reassure the patient but to get to know him better in the process Anyone who has been a recent hospital patient can realize the deadly impersonality of the present-day procedure The technician has been trained as a craftsman and cannot be expected to approach his work as an art that considers the material as well as the technic Too often, however, this impersonality extends to the nurse and doctor as well

Objectiveness has its value, in so far as it may prevent doctors and nurses from acting out in relation to a patient, their own complicated conflicts It may prevent the inflicting of unnecessary pain or medical discipline purely as punishment or may check a too ready sentimentality In the case of contagious disease the welfare of many others can be protected if painful demands are made upon the patient Nevertheless, the doctor and his nurse assistant who see their work as an art, a profession not as a craft can never forget that they are dealing with a person, not a case If the time ever comes when patients feel that using a private physician provides no greater chance for personal attention than does a clinic, private practice is doomed. Already there are increasing signs of distrust of the medical man The public is saying "Give us all the benefits of scientific medicine, but don t forget that we are suffering human beings Remember that you doctors are consecrated to healing the patient as well as the disease '

If all this applies to the practice of medicine in general how much more so does it apply to the treatment of patients afflicted with venereal disease Regardless of original causes, the method of handling the patient under treatment is one large factor to consider in the control of the disease as a social problem A patient medically cured, may readily acquire the disease again and spread it. A patient, treated as a whole may return to the community, not merely physically well but socially better adjusted, and as a result may be a possible source of prevention of the disease in others as well as in himself

In the establishment of a therapeutic relationship between a doctor and patient not only the feelings of the patient must be considered but those of the doctor himself The less mechanical and routinized the approach, the more the doctor s feelings play a part The intrusion into the office of a general practitioner by a patient with venereal disease may be seriously disconcerting If he comes from the community of which the doctor is a part, the need to keep a personal confidence may create awkwardness The patient s guilt makes him reluctant to express his feelings and his passivity or surface defiance can arouse impatience or punitive rejection

Here the physician s own attitude toward sex comes to the fore He grew up when social attitudes were different and may disapprove of present-day youth. Having in his power an undisciplined boy he may turn upon him his protest against the whole generation His personal dislike for the patient s race, social group or family may make him harsh. Out of his own youth he may retain bitterness guilt or a sense of deprivation about sex which becomes focused upon his patient He may himself have had little help in handling his problem, may even have had venereal disease and may retain a basic anxiety as to his own adequacy In his unconscious iden-

Presented at a meeting of the New York Tuberculosis and Health Association, March 9 1948.

tification, he may show repulsion or intolerance Even, he may be sexually stimulated by the patient's sexual problem and protect himself by this intolerance As a guardian of the public health, he may forget that the general public is pretty indifferent to disease except where it affects them personally Or as a member of a profession that represents the best in community responsibility and ethics, the physician may treat his patient as a culprit to be handled roughly and punished for his offense Increasingly, in the other broad fields of medicine, an effort is being made to help the sick to meet their social and emotional difficulties, but the venereal disease patient is still largely seen as the unsavory victim of his own folly

Let us look at those with whom the doctor is called upon to deal The patient who presents himself for the first time is probably a young man, still adolescent in development whether or not he has ventured into marriage He is the product of our present-day culture with its confused and inadequate handling of the sexual life of the young He has probably come from a home in which there has been a hushed attitude toward sex with only a giggling recognition that it exists His moral training has been haphazard—he has gone to church or Sunday school during his early years but has gained little from this other than a vague idea that there is a God, about whom he has no clear notions In a general way, his code is that of the Ten Commandments, but he has not learned much self-discipline, nor does he feel inclined to deny himself anything he can get He is restrained from antisocial behavior more by fear of punishment than by a code of ethics He accepts working as a means of obtaining material comforts He has paid little attention to literature or the arts because they do not contribute to earning higher wages He is pretty positive in his opinions about politics and economics, especially in denouncing those ideas which differ from the ones he has He reads the papers for the sports news, but editorials or special articles bore him

He thinks he knows what he wants out of life—as much money as he can get for as little effort as possible, physical comforts, and plenty of fun, of which sex is the most gratifying sort His sex knowledge and standards are uncertain and spotty, although he thinks he knows all the answers Some little information he has learned from his home, some from school or club leaders, or during his recent war service, but this is largely factual or in terms of what to avoid He knows something about venereal disease but is confident he can escape it Usually, he thinks in the common terms of vulgar speech, but he can use technical terms if necessary Much of what he knows he has picked up from boys and girls at his own level and out of his own experience He has outgrown masturbation and would feel cheated if he had to resort to it instead of finding some girl He has some romantic ideas from the movies about living his own life, and he supposes that some day he will find the right girl and settle down So far, though, he has kept his freedom and is glad of it Altogether, he is pretty sure of himself and feels he knows his way around

Suddenly, as the result of a bit of fun of no worse kind than usual, he is caught up short with the realization that something is wrong, a discharge or a sore Perhaps he had had a few more drinks than usual and had not been as careful about taking precautions or had been sure that the girl was clean At first he tries to make light of it, perhaps the discharge is merely a "strain"—he has heard of such things—or perhaps it is merely irritation, not a sore Anyhow, he is likely to try for a few days to ignore it, not wanting to believe that he has to pay a penalty for his fun He does not see his way clear to taking time from work to go to a doctor, even if he knows of one At last, however, his discomfort, physical or mental, becomes great enough to drive him to visit a doctor or a clinic

His smug self-satisfaction is badly shaken, and he approaches this visit with a great deal of anxiety For the first time he has to admit, and to a doctor—an adult, a parental representative—that he has been "playing around" All the childish guilt about being caught in forbidden activity floods over him He may assume a certain defiance or nonchalance to cover his fear, but he cannot hide it entirely He may fume with anger at the girl from whom he caught it or who, as he thinks, "gave it" to him He tries to excuse himself, to deny the seriousness of the infection, to recall what he has heard of the efficacy of modern treatment, but the fear persists In spite of his external manner, he is a frightened child who wants reassurance and comfort

The type of handling he gets may be one of the important influences in his whole life adjustment, may determine not only the extent of his cooperation and persistence in treatment but the handling of his sex life in the future Regardless of external hardness or sophistication, he knows he has made a mistake, and he may, underneath, be very sensitive about the whole matter It is not easy to expose oneself physically or emotionally to the pain and embarrassment of treatment At this point of lowered self-esteem he needs, more than ever, to be treated with the respect due to a sick man, not as a culprit or as an ignorant or degraded person The doctor who thinks to put him at his ease by using vulgar language makes a mistake If the patient is to

take his illness seriously, not as a mere bawdy joke upon himself, it is better for the doctor to treat it with the dignity accorded to any other ill ness and so reassure the guilty man. There is a question too, whether this is the best time to in quire into the source of the disease From the public health point of view it is important that all foci of infection be unearthed for delay may lead to other contaminations In his resentment the patient may be ready to denounce his partner, but, since this leads to investigation, he may on second thought regret his betrayal and fear for the safety of his own confidential relation with the doctor It would seem to be a more construc tive experience for him if his report of the source could be made when he is interested in cooperat ing to eradicate the disease from the community

And what of those innocently infected? A young woman about to have her first baby is found to have a positive Wassermann She may know little or nothing of the disease and yet it is important for her, as well as the physician to learn whether the condition is congenital or ac quired If she is an innocent victim and free from personal guilt the problem arises as to how to handle her feelings toward the parents she has loved and trusted or toward the husband she has chosen It is a bitter experience to submit to long and painful treatment for a disease acquired through the aberrations of others How can she be helped through the conflict of feelings that such a discovery creates? Certainly not by the giving of directions as to the need for treatment or for other physical measures Or consider the problem of the adolescent just about to face the working out of his own sex adjustment, who is found to have syphilis acquired from his parents More than medical care is needed for such a child

Whether the physician who discovers the in fection goes on or not with the treatment, he has to deal with the first reaction It is as important for the clinic to know the nature of this first handling as it is to know the source of infection. The patient's emotional reaction to his disease is more important than his intellectual awareness of what is involved in treatment One would like to know the whole train of events that have cul minated in his becoming infected At the time when he comes for care he is most ready to stop and consider these things and perhaps accept the type of re-education that he needs Such handling of the whole personal problem might be a more effective public health measure than the mere providing of treatment and the discovery of foci of infection

There are, of course, basic defects in the total social situation that cannot be corrected all at once In seeking out the girl who infected him the patient was trying to satisfy a deep and natural need with which he had no other way of dealing In so doing he was the product of our confused cultural attitude which pushes young people toward sex expression and then denies them acceptable ways of satisfaction

Much attention has been given in recent years to the sex education of children With our strong faith in the concept that knowledge is power we seem to believe that young people by knowing the basic facts of sex will be protected against future difficulties in dealing with it There is no certain agreement as to how this knowledge should be given nor by whom, nor as to just how far this education should go Neither are we sure how we expect this knowledge to be applied It is generally accepted now by even the most con servative that it is wise to answer honestly the early questions of a child as to where babies come from The embarrassing query as to how the baby is planted in the mother's body is slid over in terms of its being an expression of love between the parents, and often it is from his more sophisti cated playmates that he learns the facts of inter course.

As the child grows sex continues to be presented in an idealistic way Knowledge of anatomy and physiology is given in dignified terms and the whole process of sex is described as a sort of controlled intellectual functioning that creates little temptation However the boy or girl hears, from less serious companions that sex activity is something more not a stately ritual but a lot of fun which he ought to find out about If he is a thoughtful child who has trust in his parents, he is puzzled and goes to them for aid They are gratified by his trust, but just how far do they dare to go in being honest with him? They know that their own sexual activity has not been all for procreation. They do not like to deny their child happiness but can they admit him to this type of pleasure, and if not, what of his faith in them? After all their care in education and building trust can they leave him at this point to find his way, with other puzzled adoles cents alone in the midst of possible disaster? In this crisis they often hurriedly seek the help of a doctor but he is just as inadequate One begins to wonder whether this type of education which so thoroughly lays the foundation but cannot take the step from the theoretical to the actual may be no better than the vulgar initiation of the streets which at least is practical.

But suppose a boy knows all the facts and has avoided the pitfalls of early involvement and dis tortions He reaches late adolescent years, in experienced but instructed under internal pres sure to relieve a strong sex urge. How, even then is he to adjust his sex desires to the realities of the

social scene? Our present situation is bound to create for him a serious problem He has been helped to understand sex theoretically and has been relieved to a large extent from guilt over having sexual yearnings Our literature and theatre have held up not only the virtues but the glories of romantic love which must not be denied, even at the expense of others Advertisements have stimulated his imagination by showing almost nude women, wearing a minimum of intriguing underwear Magazines parade a profusion of girls in provocative postures quite different from those in the anatomy books He has been well cared for physically and his vitality and virility are high He has imbibed the traditional American attitude of aggressive reaching out for what he wants His moral code is vague, particularly about sex, and is constantly being weakened by newspaper reports of licentious behavior He is not ready to assume the burden of supporting a family His sex urge demands satisfaction But then, society, having pushed him to this point, denies him any legitimate way of self-gratification With this sort of preparation, he is not likely to be willing to lead a life of continence nor to confine himself to autoerotism until he marries Houses of prostitution have been banned, street prostitutes have been prohibited He may, nevertheless, find some resources of this sort or turn to homosexuality But he inevitably turns to the girls he has known socially, and among them he is least safeguarded against venereal disease The fact is that we have not found an approved solution to the problem of how young men are to manage their sex lives, and it is certain that venereal disease will abound when only surreptitious promiscuity is the rule

When he is infected and comes for treatment, all his frustration and guilt rise up to disturb him He does not think then of the total situation but only of his own shame and panic To some, this punishment is almost welcome, since they have carried, even during their apparently heedless conduct, a sense of wrongdoing It is possible that some have unconsciously invited this punishment, failing to take familiar precautions, but most have taken a gambler's chance rather than deny themselves All have been satisfying a biologic urge which society, although its existence depends upon its satisfaction, has denied a better outlet

The physician, then, who deals with a venereal disease patient must recognize that the problem before him is not simply a medical one His patient has failed not only to protect himself against disease but has also failed to find a solution to one of the great problems in his life He needs help, not only physical but mental At the least, a certain amount of individual attention is needed, and certainly his relation to his doctor is of great importance Doctors themselves, to be of real help, would do well to watch their own reactions, lest they become callous or harm the patient through too ready condemnation They cannot afford to forget that, while people may be careless or may unconsciously seek punishment, while they may be innocent victims, or ignorant, in any case their infection is not entirely their own fault but the result of a confused social situation Treatment of venereal disease must go beyond the physical, it must include a study of the patient as well as of the infection Perhaps some day the public clinics will provide adequate social and psychiatric facilities for the care of each patient For greatest effectiveness they would have to turn their attention not only to the original source of the infection but to the original way in which the infection was discovered—to the doctor who first dealt with the patient, who set the patient's attitude toward treatment, and to whom the patient may turn for interpretation of the clinic handling Until then, each physician who treats a case of venereal disease can help not only the individual but the total program of venereal disease control if he will take such time as he can find to consider for the patient the whole life story that led to the infection, and even more carefully, the attitudes within himself which may make the experience a truly constructive one for the patient, and so for the whole public

RULE EASED ON CANCER OPIATE

Metopon hydrochloride, a painkilling drug used in cancer cases, is being made available more readily to physicians, the Treasury has disclosed The drug is not a cure, only an aid in relieving pain A morphine derivative, it was developed about a year ago by the National Research Council Previously it could be obtained only by physicians on direct approval of the United States Public Health Service Hereafter, the Treasury said, it will be available to wholesale drug dealers, hospitals, druggists, and physicians The drug may now be used for relief of any serious chronic pain requiring an opiate

ACCIDENT PREVENTION IN MEDICAL PRACTICE

H E Kleinschmidt, M D , New York City

(Medical Director North Atlantic Area American Red Cross)

WHEN Mary S , aged seven, developed signs of residual rickets, the family doctor was not happy about it Of course, he was in nowise blamed by the parents, but vaguely and tormentingly there was in the back of his mind the question as to whether or not he had been sufficiently alert to the nutritional needs of Mary, whom he had attended off and on since she was born That was to his credit, and it reflected the growing sense of responsibility which physicians feel for protecting the health of the family as well as caring for them when they are sick Pediatricians, with their concern about immunizations, nutrition child training, and so on led the way They more than any other group of doctors, established preventive medicine as an important function of the physician, whether he practices a specialty or general medicine.

The responsibility for preventing accidents, a potent cause of injury and death has not yet impressed itself upon most physicians Considering that the results of accidents are just as deadly or damaging as disease, that accidents occur largely in the home, and that most of them can be prevented the physician's apparent unconcern about accident prevention is odd if not inexcusable and inconsistent Thoughtlessness ineptness and inexperience of the individual account for the great majority of accidents Safe ways of living can be made easier and surer by the foresight and conscious planning of those who serve human needs For example, safety engineers have distinguished their profession by their success in discovering and removing hazards in industry Architects now 'blueprint safety into the dwelling Designers of household appliances strive constantly to make them *accident-proof* Similarly, it devolves upon the physician who is intimately close to people and who has the run of the house so to speak, to add his share in preventing accidents He is in a strategic position to do this—more so than any other craftsman serving the family

What are his special advantages and responsibilities? He has the confidence of his patients, and he speaks the words of authority He is a trained observer and 'sees potential dangers more readily than others More important still, he has special knowledge concerning certain contributory factors responsible for accidents. The factors are physiologic and psychologic in nature. Among the former are vision defects such as astigmatism poor coordination of the two eyes inadequate peripheral vision, undue reaction to glare, hearing defects, muscular disturbances, and faulty muscular coordination. Also to be considered are arterial hypertension and organic diseases which may lead to dizziness or aberrations of sensibilities Fatigue, a common symptom of thyroid disorder, tuberculosis, and malnutrition, is a recognized contributing cause of accidents Excess of food and, of course alcohol in its immediate and carryover effects may lower the threshold of safety These are pathologic states which have accident potentialities and the least the physician dealing with any of them can do is to caution the patient against undue exposure to hazards

The psychologic conditions which may contribute to accidents have had all too little consideration. Emotional upsets are likely to affect judgment and muscular coordination Worry, loss of sleep, periodic emotional fluctuations, and neuroses, all play a role in the tragedy One wonders how many serious accidents especially among adolescents are due to a certain bravado which may be simply a form of exhibitionism * Defiance and hostility may lead to recklessness and then to a serious accident In the treatment of all such conditions the medical advisor should not forget the possibility of accidents and should take steps to guard against them

Certain drugs and medications have their peculiar effects Sedatives of all kinds tend to blunt sensibilities or to disturb judgment Quinine in large doses may be very distracting Sulfa drugs may give rise to odd sensations dizziness, or apathy Pupil dilators cause temporary vision distortions When using or prescribing any medication that may have marked physiologic effect the patient should certainly be forewarned and instructed Even that might not be enough those responsible for the care of such persons, parents nurses caretakers, should be instructed in what to expect and cautioned to be particularly alert in guarding against hazards which the patient, under the influence of the medication may not sufficiently appreciate himself

Probably the physician's efforts to prevent accidents are most fruitful in dealing with people at the two extremes of life young children and the aged Is there any reason why the family

Of the 3*7 deaths among th age group ten to fourteen in 1945 in New York State 162 were recorded as due to accidents 134 of these deaths were boys and only *8 girls

doctor should not take the mother of children on a tour of inspection in her own household from garret to cellar? He may begin by opening the ubiquitous "medicine cabinet" in the bathroom and point out the dangers there—antiseptics, leftover medicines, caustics, attractive looking pills, etc He may look into closets for the discovery of cleaning solutions and powders where itchy little hands can reach them In the kitchen he looks for threats from open flames, hot water and steam, electrical appliances He notes where knives and ice picks and scissors are stored, shows how utensils should be placed on the stove out of reach of young explorers In the living room there may be rugs that slip, an unguarded fireplace, furniture that may easily topple In the playroom may be treacherous toys such as bows and arrows, dart games, tacks, pins, marbles, and innumerable articles begging to be put into the mouth or poked into the nose of a curious toddler On the cellar steps there may be jars, overshoes, mops, and washboards Almost anywhere in the house the alert searcher may find defective electrical fixtures The doctor may wish to advise that a gate be placed on this stairway, a guard on that window, a special closet for cleaning materials, and so on Such a search in the immediate environment of his charges for accident breeders may not be traditional medical practice, but it can become as challenging as the search for disease breeders through the physical examination which is accepted practice Insisting that a defective electrical fixture be repaired is just as valuable a service as urging that a pair of diseased tonsils be removed To the victim it makes little difference whether his discomfort originates from within or without

A by-product of such an "environmental inspection" is that the members of the household are educated to the needs of safety practices Not only safe "things," but also habits and practices they learn are needed to guard against accidents Most people must have their attention directed to hazards before they recognize them, they must be stimulated to become safety-conscious How can that be done better than through a demonstration by the one friend of the family who is known to be concerned about the well-being of the family

The care of the aged is receiving increasing attention Physicians interested in geriatrics are discovering more and more ways of making the sunset period of life more mellow and enjoyable Old people are particularly accident-prone In one year (1945) 77 per cent of the victims of fatal falls in the United States were sixty-five years of age or older [1] That is but one index of the accident threat to elderly people The reasons for this are obvious enough As perceptions are gradually blunted, as reactions are slowed, as once supple joints become stiff, escape from accidents becomes less certain Good household planning can help to safeguard grandfather The fewer stairs there are to climb, the better He needs handrails on the stairs He should have a flashlight for use at night There should be no slippery floors or loose carpets Toys and other objects should not litter the floor Medicines should be controlled Thoughtfulness on the part of the rest of the family is a grace to be cultivated. The young and robust easily forget the handicaps of age and express their impatience, not with sadistic intent, of course, but with cruel effect nevertheless, both physically and emotionally As an interpreter of how older people feel, how they react, what special care they need, and so on, the doctor performs an invaluable service, not only in safeguarding the aged against accidents but also in making their lot generally more cheerful and happy The doctor knows, as no one else, how certain pathologic conditions common in old age may affect physical and emotional reactions Only he knows how certain drugs will condition these reactions Along with his instructions to the aged patient, he needs to inform the family also as to what to expect under certain circumstances

It is hoped that these somewhat random thoughts may stimulate the physician to think more seriously of accident prevention Perhaps what we need is more precise information on how accidents occur As Osler always emphasized the etiology of disease in his "*Practice of Medicine*," so should we make searching inquiry as to the direct and predisposing causes of injuries resulting from accidents Some real research work is indicated in the field of pediatrics, surgery, geriatrics—in fact, in all branches of therapeutic medicine Our general knowledge, as public-spirited citizens, should be sharpened, made more precise, so that we, the medical profession, might take our place of leadership in the professional aspects of accident prevention, for accidents do seriously impair health and cause death, and 90 per cent of all accidents, we are told by the National Safety Council, are preventable In New York State alone there were 8,069 fatal accidents in 1946, and nearly one-half occurred in the home

MEDICAL TREATMENT OF MÉNIERE S SYNDROME

JOHN J RAINEY, M D , Troy, New York

(From the Troy Hospital)

THIS report is concerned with the results obtained by the intravenous use of histamine phosphate over a period of seven years in patients who are the victims of the symptom complex called Ménière's syndrome.

Since 1940, we have treated 121 patients at the Troy Hospital by means of intravenous histamine phosphate The results were excellent in about 83 per cent of the cases The condition was more frequent between the ages of thirty-eight and sixty-five, with women predominating and the best results were obtained with this age group In those patients who received immediate relief there was a return of symptoms in about 25 per cent of the cases The symptoms recurred within a few weeks or months, and many of these were given a second or third series of treatments In this group were three patients who obtained prompt relief but later went elsewhere for section of the auditory nerve. The outcome following nerve resection will be taken up later

It is believed that the attacks of Ménière s syndrome are brought on by a local disturbance of the inner ear due to a release of histamine. There is no positive evidence of the purpose of histamine, and it would appear that there are other substances that are in a measure responsible for allergic reactions [1] This may be an explanation for the failure of histamine intravenous therapy in some patients who have severe and unmistakable symptoms of the syndrome

Some writers wish to substitute the term labyrinthine hydrops for Ménière s syndrome. However it is a highly significant term, understood by all and not easily confused with any other condition The basis of the syndrome is unilateral or bilateral nerve deafness, accompanied by tinnitus, and with "objects spinning about the patient or "the patient spinning about the objects the attacks being complicated by nausea or vomiting It would therefore, seem best to hold fast to the time-honored and euphonic term Ménière s syndrome, and not be led down the devious pathway of labyrinthine hydrops.

It is well to bear in mind that the earlier a patient is treated by histamine intravenously the more certain the cure With patients who have been afflicted for several months or a year or more, it is hardly to be expected that the majority will respond to the treatment It is true that most patients get well with the passing of time but economic disaster faces the patient who is incapacitated for many months by attacks The physician assumes a grave responsibility in those cases which do not respond readily to oral or subcutaneous treatment

As already pointed out, all early cases do not respond to intravenous treatment but most of them do The histories of two cases are given and the happy results are due to their physicians, who prescribed early intravenous therapy

Case Reports

Case 1 —The first patient was a man of 50 a manager of a large manufacturing plant. His first attack occurred January 25 1946 It was a severe major attack, and he was rendered helpless because of the vertigo He had almost unbearable intermittent ringing in his ears, as well as vomiting Within the next few days he had two more attacks On February 2, 1946 he consulted Dr Clement J Handron, of Troy New York, and while in Dr Handron s office was stricken with a major attack. He was taken to the Troy Hospital by ambulance and was put on a low sodium diet and given ammonium chloride. There was no improvement and on February 8 1946 he was given the first of a series of three intravenous histamine treatments the technic of which is described elsewhere.[2] After leaving the hospital he attempted to carry on his executive affairs but found himself unsteady at times He remained away from business for three weeks and has been well ever since.

Case 2 —A clerk, aged 34, a patient of Dr Matthew J Keough of Cohoes, New York, volunteered for Army service and was twice rejected because of bilateral nerve deafness. His third attempt to enter the service was successful, and he was assigned to a southern state. He became an artillery instructor After two years he was discharged from the service because of a marked increase in his deafness and was given 10 per cent disability This was later revoked because after a casual examination it was felt his hearing had improved He was then given 10 per cent disability for an arthritic condition. On the morning of September 16 1947 he had an attack of vertigo and fell to the floor He was helpless for two hours. Since then, if the patient turned his head to the right he would bring on an attack and was in danger of falling Showing no improvement with the usual remedies he entered the Troy Hospital on September 26 1947 and three days later was given the first of three intravenous histamine treatments Following the treatments, he could turn his head to the right without any suggestion of an attack Three weeks later he returned to work

---

Presented by invitation at the taff meeting of the Mary McClellan Hospital Cambridge New York April 1 1948.

These two patients in different age groups suffered from major attacks of the syndrome Each had bilateral nerve deafness, the left ear being more involved Movements of the head had little effect on the older patient, turning the head to the right brought on an attack in the younger man The first patient had some warning of an attack and could save himself from falling, while an attack instantly felled the younger man The fact that neither patient was of the neurotic type played an important role in the good results

Three of our patients who had an arrest of attacks for several months went elsewhere for nerve section on the recurrence of some of their symptoms

Case 3 —A teacher, aged 47, with bilateral nerve deafness, was first treated in July, 1943 She was free of attacks until December, 1943, when she was treated again She carried on her duties and in May, 1944 received another series She was advised that her side symptoms were due to the menopause and that in a year or two she would be quite well However she went to a large clinic, and a section of the right vestibular nerve was performed Until a year ago she had shown no improvement

Case 4 —A woman, aged 40, a white collar worker with bilateral nerve deafness, was thrown to the floor on November 17, 1944, while at work on a stepladder Following the accident, she complained of headache and unsteadiness An x-ray showed a small fracture through the left mastoid bone In May, 1945, she began to have major attacks of the syndrome, and it was necessary on more than one occasion to remove her to her home by ambulance In October, 1945, three intravenous treatments of histamine were given at the Troy Hospital She remained free from attacks for five months The attacks recurred, and she was given another series of treatments

In August, 1946, her symptoms again returned, and she went elsewhere for nerve section Six months passed after the section of the right auditory nerve before the symptoms abated For more than two years, the patient, who was highly emotional, had the additional disturbing factor of being in and out of compensation court A few months ago, her lawyer, who made a special study of the syndrome, was rewarded with a decision in favor of his client She was awarded 66 weeks salary and 100 per cent disability for the deafness that resulted from the section of the auditory nerve The patient is now free from vertigo, but a period equal to that following histamine therapy was required

Case 5 —This young woman of 18 suffered from bilateral nerve deafness, the left ear being more affected She was first examined on November 23, 1945 The previous year she had had a major attack of the syndrome and fell to the floor and remained helpless for four hours For the three weeks before coming to us she had had severe attacks every day or two She received intravenous therapy during the last days of November, 1945 She was free from symptoms for several months She then had attacks of vertigo on and off that lasted for from one minute to one-half hour On January 21, 1947, section of the left eighth nerve was done She married several months later and up to the present has had no major attacks

Case 6 —A woman, aged 56, was first seen on July 19, 1947 She had a section of the eighth nerve performed on April 30, 1935 This was several years before the introduction of histamine as a therapeutic in Ménière's syndrome Before operation she suffered from attacks for a period of six weeks Following operation on the left ear, the vertigo ceased, the tinnitus diminished, and total deafness in that ear was an after-effect Five and one-half years later there was a recurrence of the vertigo but less severe than before the operation This lasted about two months and then disappeared For two weeks before her visit to the office on July 19, 1947, she had been having attacks just as severe as those before operation During the original attacks, objects rotated about the patient Now objects no longer spin about her, but she has a sensation of levitation She feels as if she is being whirled on ascending spirals Prior to the nerve operation twelve years ago, she got some relief by lying flat, but now the vertigo is aggravated by that position She was given sodium bromide, which seemed to control the major attacks She returned to work in a few weeks For a month or so it was necessary for her to get into and out of bed slowly and carefully and not to retract the head. Now, six months later, she no longer takes medication of any kind and is symptom free Although this patient has now a moderate degree of nerve deafness in the right ear the return of symptoms may be remotely due to a regeneration of the severed vestibular fibers of the eighth nerve on the left side Intravenous histamine therapy was not used in this case because the patient responded so promptly to sedation

Several patients before coming to us had received benadryl The drug had had no effect on the major attacks and only resulted in making the side symptoms worse One patient who suffered from severe major attacks of the syndrome had been given benadryl and pyribenzamine over a period of several months She reacted so poorly following intravenous histamine therapy that further treatment was postponed for several weeks Some patients are extremely hypersensitive to benadryl, as shown in a recent report of a patient who developed sharp attacks that simulated Ménière's syndrome from the administration of this drug [3] It would be well for the physician who contemplates intravenous histamine therapy to be certain that none of the side symptoms of these new and popular drugs is present

Comment

Until the advent of intravenous histamine phosphate a decade ago, there was no therapeutic agent to brighten the lives of many patients

afflicted with Ménière's syndrome Some of them developed a sullen disposition which set them apart from their friends

We know that most patients get well without treatment or with aid of sedatives which tend to bridge over emotional crises It is our belief that only about one patient in seven requires intravenous therapy

Three of our patients had auditory nerve section, and only one showed real improvement Total deafness resulted in the ear operated on in all three. Another patient had a nerve section twelve years ago, with return of symptoms five and one-half and twelve years later It would appear from this experience that section of the eighth nerve is rarely, if ever advisable.[4]

The new drugs, benadryl and pyribenzamine should be used cautiously in Ménière's syndrome, if at all, as they have the effect of confusing the issue

The salt-free regimen plus ammonium chloride, has proved to be of no benefit in our experience and with histamine used subcutaneously can be considered only as a valuable placebo

Conclusion

The administration of histamine phosphate intravenously for this syndrome or other conditions is time consuming[5] It takes at least one and one-half or two hours of the physician's time for each treatment, which should be carried out in a hospital under careful supervision However, the physician will be well rewarded by grateful patients, the majority of whom will respond to his efforts. If the physician's diagnosis of Ménière's syndrome is correct, he will have in histamine phosphate used intravenously the best treatment at the present time

ON THE CONFIDENTIAL REPORTING OF CAUSES OF DEATH

Some physicians may be reluctant to report on the official record a cause of death which may reflect unfavorably upon the memory of the deceased On the assumption that the official statistics for such causes of death, particularly alcoholism and syphilis, would thereby be improved a confidential method of reporting was inaugurated as an experiment, in the Borough of Manhattan, New York, January 1 1939 The confidential method differs from the open method previously used (and still used everywhere else in our country) in that the physician's medical report is made on a separate form and is not released with the copy of the death record. In 1943 the New York City Department of Health initiated a study of the statistical efficiency of the confidential certificate. The conclusion drawn from that investigation recently completed is that to date, the use of the confidential death certificate has had no significant effect on the accuracy of mortality statistics in New York City

The study included an intensive analysis of the case histories of 7 330 persons who had died in hospitals in 1937–1938 (when open reporting was in use in all boroughs) and in 1939–1941 (when confidential reporting was in effect in Manhattan) The primary cause of death as determined from hospital diagnoses was compared with the primary cause as reported on the death certificate For most causes including cancer the two sources were in substantial agreement. On the other hand five causes were understated on death certificates according to the hospital records These causes together accounted for about one seventh of all the deaths

A review of the data for the understated conditions reveals no evidence that more accurate statistics resulted from the use of the confidential death certificate. Only about one half of the deaths due to alcoholism were so reported, whether the open or the confidential certificate was used. Improvement in the reporting of the mortality from syphilis was noted in all boroughs This no doubt reflects the intensive educational and clinical programs which were launched in New York in 1935 to bring syphilis under control The findings are basically similar for the other understated conditions

Judged by the findings from this study the confidential method does not improve the accuracy of mortality statistics. In fact no method of reporting, of itself can be expected to eliminate all the factors which impair these statistics. Carelessness, ignorance of the rules of certification, and lack of understanding of the mechanisms of death have a greater bearing on the information that is recorded than does the method or the physician's unwillingness to record causes of death to the best of his knowledge —*Statistical Bulletin June 1948*

Case Reports

PALINDROMIC RHEUMATISM

SELVAN DAVISON, M D , New York City

IN 1941 and 1944, Hench and Rosenberg published an account of a new syndrome they called palindromic rheumatism (from the Greek "to run back") which includes the following features Multiple afebrile attacks in an adult of either sex of acute arthritis, periarthritis, and sometimes para-arthritis, with pain, swelling, redness, and disability generally of only one, but sometimes of more than one, small or large joint They appear suddenly and develop rapidly, usually lasting a few hours to several days and recur at short or long irregular intervals, without any accompanying constitutional reaction and with complete functional restitution of the affected joints The sedimentation rate is normal or, at most, relatively and transiently elevated Despite the frequently large number of recurrences, not only is function always completely restored, but repeated x-rays over a period of years reveal no pathology in and about the affected joints There is no connection with season and weather Salicylate therapy gives very little or no relief The prognosis is guarded, inasmuch as Hench and Rosenberg found 15 per cent spontaneous cures, 44 per cent improved, 26 per cent unchanged, 11 per cent worse, and 4 per cent (one patient) dead of intercurrent disease [1 2]

Since the first report in 1941, which included 34 cases, there have been only scattered articles and case reports on the subject Nelligan remarks that the first British publication of the entity palindromic rheumatism was in 1945 [3 4] Apart from Hench and Rosenberg's cases, this writer has found only 11 others in the literature Although it is apparently not a very common cause of rheumatic disorder (5 to 6 each year out of 4,000 to 45,000 cases of rheumatism seen at the Mayo Clinic), it presents itself often enough so that it should be more readily considered in the differential diagnosis, particularly in the puzzling cases A great deal of time and money may be spent in repeated treatment with physiotherapy, allergy desensitization, various injections, and other methods, despite obvious failure of therapy, unless the correct diagnosis is made, for palindromic rheumatism has not as yet responded specifically to known therapeutic measures

The following case is reported in an effort to further stimulate recognition of this interesting syndrome

Case Report

G S J , a 51-year old white man, a civil engineer, first began to have arthritis eleven years ago As a child he had had scarlet fever, diphtheria, and measles A tonsillectomy was performed thirteen and again ten years ago He was otherwise well until eleven years ago when he first noted acute pain in various joints at irregular time intervals, usually involving no more than one or two simultaneously (large and small) and continuing from several hours to three to four days Swelling, pain, tenderness, redness, and heat without fever or malaise were associated with each flare-up, and, following each episode, the joints were without any noticeable change or loss of function One and one-half years ago, while in the Navy, he began to have more frequent and more severe bouts of arthritis, involving the left knee and both hands He was admitted to the Bethesda U S Naval Hospital A complete work-up revealed constant normal temperature, normal sedimentation rates, normal blood count and differential white count, and normal blood uric acid (3 0 and 3 3 mg per cent) X-ray examination of the paranasal sinuses showed them to be clear throughout X-rays of both hands revealed no evidence of bone or joint pathology Physical examination apart from the transient arthritis was normal A series of allergy skin tests was performed and resulted in moderate reaction to house dust, silk, wool, orchard grass, timothy, short ragweed, and Staphylococcus aureus Hyposensitization was carried out with house dust, mixed bacteria, and mixed grasses

He was comparatively free of attacks until eight months ago, when episodes of arthritis recurred and have continued to the present, despite varied regimens of therapy and many diagnoses The writer first saw the patient two months ago during a severe attack involving the left wrist and the fingers of the left hand During the previous month there had been almost constant recurrence of pain and swelling in many joints The severe episode during which he first presented himself was while on intensive salicylate therapy He had with him the abstract of his Naval hospitalization, and I was struck by the findings of normal temperature and sedimentation rate during acute attacks and by his appearance of general good health

Physical Examination —The patient was a well-developed, well-nourished, active white adult He favored his left upper extremity, and examination revealed the fingers of the left hand to be red, hot, swollen, tender, and painful on motion No other joints were involved The blood pressure was 120/76 The heart and lungs were normal, as were temperature, pulse, and respiration

Laboratory —The erythrocyte sedimentation rate was 18 mm fall in one hour, by the Westergren method Hemoglobin was 90 per cent (Sahli), white blood count 6,250 per cu mm., differential white blood count, 60 per cent polymorphonuclear, 30 per cent lymphocytes, 1 per cent monocytes, and 1 per cent basophil cells Urine analysis was negative Blood Mazzini reaction was negative An electrocardiogram was essentially normal. X-rays

of the wrists hands and left shoulder revealed completely normal bone and joint structures

Course.—The acute attack had hardly subsided when he was seen again six days after his first visit, with severe arthritis and periarthritis of the left hand. This occurred during intensive salicylate treatment. The seizure lasted two days, and after two days freedom there was a flare-up in the right hand and wrist. He has been seen at varying intervals since then and has had constantly repeated episodes most often in the left shoulder, the wrists and fingers although the symptoms have diminished in severity. A complete blood count and a sedimentation rate during this period were found to be normal. A blood uric acid was 1 6 mg. per cent.

Therapy.—As has been mentioned above salicylates in full doses were of no help nor was heat in various forms. The allergy desensitization carried out by the Naval hospital was questionably helpful in that he was moderately free of symptoms for about eight months. During the past year he has had numerous and varied forms of treatment directed either at the arthritis or systemically or both, and no measure has been successful. The lack of response to any form of therapy is a point in favor of the diagnosis of palindromic rheumatism.

Hench and Rosenberg state that, despite certain similarities, the disease they described differs from that in the article by Kahlmeter [5]. In the latter an allergic factor was considered the cause but Hench and Rosenberg are not prepared to accept palindromic rheumatism as allergic in nature. However pyribenzamine in doses as high as 200 mg. in four hours was tried several times in this case. During one attack the patient reported he thought he had obtained some relief coincidentally with taking the pyribenzamine. The known proclivity of this disease of acute episodes to be sudden and short-lived casts great doubt upon his observation.

Summary

A case has been presented of recurrent acute arthritis in an adult man, with history course laboratory and x-ray findings that would seem to place it in the category of palindromic rheumatism.

STATE DEATH RATE SHOWS THIRTY PER CENT DECLINE

New York's death rate has dropped more than 30 per cent in the last half century, Dr. Herman E. Hilleboe, State Health Commissioner, reported recently that there were 11.1 deaths per 1,000 population last year compared to 17.2 in 1897.

The decline, he said, was due largely to progress in control and prevention of the communicable diseases of childhood.

On the other hand, mortality from chronic diseases of middle life and old age has increased as the average age of the population moved upward, Dr. Hilleboe stated. In 1900 heart and blood vessel ailments caused 371.8 deaths for each 100,000 of population. By last year the rate was 544.6 per 100,000.

Fifty years ago, Dr. Hilleboe said, the diseases of childhood claimed 15,000 lives annually in the State. Last year this mortality was less than 500.

RADIOACTIVE SPOTTING METHOD USED TO LOCATE BRAIN TUMORS

Brain tumor detection by means of a radioactive dye that becomes concentrated in these abnormal growths and can be detected through skull and skin with a Geiger-Muller counter is the newest medical development in the use of atomic-pile by-products.

It has been tried out successfully in a dozen cases at the University of Minnesota Medical School and is reported in *Science* (May 28) by Dr. George E. Moore, senior research fellow of the U. S. Public Health Service.

It was already known that a dye called fluorescein has an affinity for tumorous tissue. To render it radioactive Dr. Moore chemically tacked on some radioactive iodine, converting it into diiodofluorescein. Small, calculated quantities of this were injected into the veins of patients suspected of having brain tumors who were to undergo operations.

In a short time the blood had been carried to their heads where the counters detected the presence of the radioactive atoms. Some of the iodine was present all over the brain, but on the patients' heads there were certain spots where the counters ticked much more rapidly than they did elsewhere. This was taken as indicating the possible presence of a tumor beneath that spot on the skull.

Subsequent operations proved the radioactive spotting method to have been correct in a large proportion of the cases.

The method is not considered infallible and is to be used only in connection with other methods of diagnosis. So used, however, it should be helpful.

FATAL AGRANULOCYTOSIS FOLLOWING INGESTION OF AMINOPYRINE

SIDNEY LEIBOWITZ, M D , New York City

(*From the Medical Service, Beth Israel Hospital*)

EVER since Schultz presented four cases of agranulocytosis in 1922 and described the clinical picture in detail, increasing interest in this disease has been evidenced [1] At first the literature was occupied with numerous case reports corroborating Schultz's description [2] Then, with the presentation of careful bone marrow studies, it became generally accepted that this truly was a disease entity, although even to the present day there is still strong disagreement with the more generally accepted theory of pathogenesis of maturation arrest of the myeloblast cell stage [3-10] In 1934, Madison and Squier pioneered in the question of the cause of the disease with their presentation of 14 cases all of which had received aminopyrine [11] Subsequently, and continuing to the present, the evidence establishing aminopyrine as a causative factor (although not the sole one) has steadily increased [5 6 12-14]

The case being reported herein is one more instance of fatal agranulocytosis where aminopyrine had been ingested It is being presented, however, because it has several additional interesting features (1) a new drug (Subenon) had been taken by the patient, and, until it became known that aminopyrine entered into the picture, this drug excited great suspicion as the possible cause of agranulocytosis, and (2) diphtheria bacilli were found in the throat culture

Case Report

History —N G , a 60-year-old white woman, was admitted to Beth Israel Hospital on April 13, 1946, with a known five hours history of fever, sore throat, and rash. The patient was first observed five hours before admission, when no satisfactory history was obtainable because she was alone and toxic, mildly disoriented, edentulous, and hoarse By sign language, she indicated pain in the neck and throat and by writing she indicated that she had been ill for three days with sore throat She also indicated that she had taken five aspirin tablets daily with sodium bicarbonate during the four to five days prior to admission Her occupation was serving as a baby's nurse

Physical Examination —On admission the patient was acutely ill, flushed, dyspneic, and breathing with obvious obstruction in the throat She was dehydrated and extremely hoarse. Over the skin of the abdomen, anterior chest, and breasts, there was a macular eruption consisting of irregular, pale red areas measuring up to 1 cm in diameter, all of which faded on pressure Four of these macules bore tiny, rounded, nodular, hemorrhagic centers which did not fade on pressure Two macules were noted on the forearms The tongue was dry and boardlike Temperature was 104 F , pulse 120, and respirations 32 Blood pressure was 140/80 Nasal mucosa was reddened without pus in the nares The soft palate and uvula were markedly edematous There was a grayish slough on both tonsils At the base of the tongue and over the lymphoid tissue was a large sloughing membrane Examination of the larynx showed a thickened and reddened epiglottis There was marked edema of the right side of the larynx about the right cord Both cords appeared reddened The right side of the neck was swollen externally with enlarged posterior cervical lymph glands The left posterior cervical glands were enlarged There was no episternal retraction The heart was negative except for the tachycardia Heart sounds were obscured by the mucous rales in the throat Lung fields were clear Liver and spleen were not palpable

Laboratory Data —Blood count done on admission revealed 4,500,000 red blood cells and a white blood count of 900, with segmented forms difficult to find in the smear

Course —The white blood count substantiated a diagnosis of agranulocytic angina The patient was given 100,000 units of penicillin intramuscularly every three hours She was placed on continuous intravenous fluids, alternately normal saline and five per cent glucose in saline She took little or no fluids by mouth, despite attempts to feed small quantities of warm fluids She required suction of the throat every ten to fifteen minutes and breathed more comfortably after each suctioning Tracheotomy was considered at the time of admission but was not performed because of relief by the frequent suctioning She was not cyanotic One blood transfusion with 500 cc of whole blood was performed Her course was down hill from the very start After twenty-four hours, the throat showed a large necrotic mass involving the right tonsillar area and extending to the uvula There were large sloughing areas at the base of the tongue The edema of the soft palate was diminished, but the edema of the right side of the larynx was unchanged There was room between the cords for breathing, but a large amount of mucus collected and had to be removed continually The macules described on admission were present on the skin of the back twenty-four hours later There was dullness over the right lower chest posteriorly with impaired fremitus Breath sounds were almost completely obscured by the coarse rhonchi from the mucus in the throat.

Blood count performed twenty-four hours after admission showed 800 white cells Sternal marrow puncture was performed forty hours after admission and revealed complete aplasia of white cell elements At this time, blood culture taken on admission was negative, and culture of the throat taken on admission showed Klebs-Loeffler bacilli Sixty-five thousand units of diphtheria antitoxin were administered intramuscularly, despite the fact that it was our clinical impression that the patient did not have diphtheria but was probably harboring the organism as a carrier Virulence test on the diphtheria bacilli was later reported as positive The patient expired forty-five hours after admission The immediate cause of death was toxemia from the throat infection which was undoubtedly secondary to the underlying agranulocytosis

Additional History —Following the death of the patient, it was discovered that during the month preceding her illness she had taken 1 or 2 Subenon* tablets three times daily Subenon consists of calcium

* Proprietary product of Seydel Chemical Company

double salt of benzoic acid and benzyl succinate.[13] This information temporarily excited our interest because of the possible relationship of the benzyl salt to the agranulocytosis. However further investigation revealed the following facts

On May 12, 1944, i.e. almost two years prior to the fatal illness, she had received 100 tablets of Causalin* and had renewed this prescription a month later. This latter bottle, still containing 82 of the Causalin tablets, was found in the purse of the patient at the time of her death. Evidence was unearthed that corroborated the suspicion that she had recommenced taking these tablets during the two weeks preceding death. Each Causalin tablet contained 1.82 grains of aminopyrine. The remaining listed ingredients per tablet were 1.82 grains of ethyl salicylate carbonate and 3.86 grains of 8-hydroxy quinoline 5-sulfonic acid.

Autopsy Findings

Gross Examination.—Skin bears numerous dark and pale red spots, the largest ones being in the front of the right axilla, in the fold under the right breast and in the left lower abdominal quadrant. The axillary one has a pale gray center. These lesions are flat and there is no grossly visible ulceration.

Lower half of left lower lobe of the lungs is atelectatic. Right upper and middle lobes are emphysematous. Right lower lobe is almost entirely atelectatic.

The tongue is coated throughout. In addition its base is partly covered with dark brownish-green friable masses, more so on the right side. The pharyngeal wall is severely edematous. In a few areas about 3 mm. in diameter the uppermost layers are yellowish and grayish-green, obviously necrotic. The piriform sinuses are much narrowed by edematous swelling of the mucosa, which is partly pale yellow, partly cyanotic. The right aryepiglottic fold in its midportion forms an ovoid yellowish-green, swollen, translucent mass measuring 1.5 by 0.8 by 0.8 cm. A similar condition of the tissues prevails in a tapering zone which has its upper end at the upper edge of the epiglottis on the right side. The left aryepiglottic fold is also considerably swollen. On the posterior surface of the epiglottis to the right a circular area 3 mm. in diameter is opaque yellowish-gray and protrudes slightly. A similar but irregularly outlined flat area, 8 mm. in diameter is situated near the right edge in the upper third of the epiglottis. The laryngeal mucosa above and below the ventricles also is edematous. The edema reaches down to the cricoid cartilage.

The rectum 8 cm. above the anus bears two slightly raised dull yellowish-gray areas about 2 mm. in diameter, surrounded by narrow red zones. Bone marrow in the upper third of the right femur is pale yellow, semifluid. The cut surfaces of the sternum are somewhat paler than those of the vertebrae (strawberry colored) and have a slight yellowish tinge.

Microscopic Examination.—Skin sections from the petechiae show tiny fibrinoid necroses involving the capillaries and small veins. Base of tongue section shows an extensive area of ulceration. Supplanting the desquamated epithelium is an edematous mass of fibrin in which remnants of necrotic vessels can be made out. At the base numerous fibroblasts are present as well as other mononuclear elements. Practically no polymorphonuclear leukocytes are present. Epiglottis section shows severe inflammation and edema. There is a similar ulcerated area in which much necrotic material can be seen. Here, too mononuclear elements are present at the base. Aryepiglottic fold sections show very marked edema with similar necrosis, ulceration and inflammation. Again, practically no polymorphonuclear leukocytes are seen. Pharynx section from the lateral wall shows a similar picture. A large area of necrosis is seen deep under a crypt. A small ulceration of the larynx is seen overlying the area of extensive edema. Rectum section shows a small necrosis in the mucosa and adjacent submucosa. There is little inflammation and what there is is mainly plasma cellular. In the femur the marrow is almost entirely replaced by fat. In the sternum, vertebra, and rib erythropoietic elements predominate. No cells of the myeloid series are found. Megakaryocytes are very numerous. Fairly numerous multinucleated cells with large nuclei and slightly basophilic cytoplasm are also present. Transitions between these and megakaryocytes are thought to be recognized.

Postmortem Bacteriology.—Throat cultures showed cocci of all kinds including streptococci and numerous yeast cells. No diphtheria bacilli were seen. Skin lesion and bone marrow were sterile. Staphylococcus albus was found in the heart blood.

Pertinent Final Anatomic Diagnoses.—Agranulocytosis; multiple necroses and severe edema in pharynx; superficial necroses base of tongue; severe edema of larynx; necroses, posterior surface of epiglottis; small necroses, rectum, and multiple hemorrhages in serous surfaces and skin were the final diagnoses.

Discussion

This case is a classic example of extreme sensitization to the drug aminopyrine. The mechanism involved in agranulocytosis is akin to anaphylaxis with an initial dose being necessary to sensitize the patient. Here the patient was initially sensitized twenty two months prior to the onset of clinical signs. The picture was explosively apparent when she recommenced the ingestion of her Causalin tablets. The dosages involved were characteristically small. Madison and Squier reproduced the picture with a 0.3 Gm. dose.[11] Witts has stated that the total dose commonly ingested prior to sensitization is 2.5 to 25 Gm. and that so long as an individual is susceptible as little as 0.2 Gm. may precipitate an acute attack.[12]

We feel justified in eliminating the Subenon drug as a causative factor. Because of its benzyl radical, it excited suspicion until the ingestion of aminopyrine came to light. Despite the vast evidence in the literature incriminating benzene derivatives, we believe that the Causalin is the likely causative agent.[14-19] This view is supported by the overwhelming number of reports both clinical and experimental, which have related aminopyrine to this

* Proprietary product of Amfre Drug Company.

disease etiologically and by the specific history eventually elicited in this case

The possibility of diphtheria entered into the differential diagnosis at the start but was rejected on clinical grounds The finding of diphtheria bacilli by throat culture was, therefore, a surprise Diphtheria antitoxin was administered on empiric grounds, but we feel we were dealing with a carrier The similarity between the oral lesions in diphtheria and agranulocytic angina has been emphasized by Gordon and Litvak.[20]

This case demonstrates that the doctor must often assume the role of a fact-finding detective It required painstaking investigation to piece together the history (most of it done postmortem) which made clear the probable clinical chain of events Fitzhugh has said " in this connection [suspecting and proving aminopyrine ingestion] it is important to emphasize the fact that an accurate history of previous medication is often very difficult to obtain and real 'detective work' is sometimes necessary to lead to the truth."[6]

Summary

1 A case is reported of fatal agranulocytosis following ingestion of aminopyrine in a 60-year-old woman

2 The case presents three especially interesting features a history of ingestion of a relatively new drug, Subenon, the growth of diphtheria bacilli on throat culture antemortem, and the "detective work," particularly postmortem, which was necessary to align an accurate history This history, as compiled, strongly suggests aminopyrine as the causative agent

THIRTY-FOUR NEW HORMONES DISCOVERED

Discovery of 34 male hormones that may provide a clue to the cancer mystery has been announced by Dr Cornelius P Rhoads, director of Memorial Hospital and Sloan-Kettering Institute of New York.

The hormones were identified during tests seeking to "pinpoint" the cause of cancer, Dr Rhoads told more than 800 medical specialists at the American Urological Association's annual meeting in Boston in May

Researchers had already found "promising" evidence linking the disease with the faulty manufacture of these homrones, he said

Although statistical data were still inconclusive, Dr Rhoads said that the "possibility was good" that eventually the research would uncover the specific element in body chemistry that causes cancer With that information, he said, positive control of the disease would be in sight

Concurrent research on the hormones had also indicated there might be strong hormone factors in hypertension and several other chronic disorders for which no cause yet had been found.

As the ability to "break down" body secretions into hormone components became more refined, Dr Rhoads said, it was further expected that the study would develop a method of "screening" that would throw new light on mental deficiencies, criminal tendencies, and personality defects

Dr Rhoads said the prospect was the first major coordinated effort, except those during the war, to attack an important medical problem

EXTREME HYPERTHERMIA

MARTIN J LOEB M D , New York City
(From the Bronx Hospital)

CASES of extreme hyperthermia have been reported in medical publications from time to time. Galbraith in the *Journal of the American Medical Association*, March 31 1891, reported a temperature rise to 171 F This case was later found to be fraudulent.

A. Jacobi reported a temperature up to 148 F in a patient suffering from hysteria, and in his paper he referred to numerous instances of extreme hyperthermia.[1] Hombourger in a thesis on hyperthermic fevers collected many such reports, including the report of a case by Bryant in which the temperature reached 170 F.[2] Murdoch reported a fever in a hysterical patient which reached 120 F.[3] Some of these cases of high temperatures were later discredited.

It is noteworthy that cases of extreme hyperthermia, such as temperatures ranging from 120 to 170 F , were all reported in the literature in the latter part of the last century and the early part of this century.[1-3] There have been no reports of such extreme temperatures in recent literature. There is no question that all of these extreme cases were fraudulent, produced by some trick of the patient. The survival of patients with temperatures far above the heat rigor of mammalian muscle is obviously impossible. It is remarkable how many astute clinical observers of a previous generation were fooled by these tricks It seems that at the present time the patients are more honest, or the doctors are not so easily duped

Ward J McNeil states that temperatures above 114.8 F in man should be considered the result of fraud or trickery and are not to be accepted without more convincing proof than has so far been presented in any instance. Temperature readings between 41 (105.8 F) and 46 C (114.8 F) properly designated as hyperthermia, should be accepted as valid only after the most careful scrutiny of the evidence in each case."[4]

The temperature of the patient whose case is reported here reached at least 110 F since the thermometer was graded to 108 F and the space above 108 F to the top of the thermometer was equal to 2 degrees. It is my belief that the patient s temperature rose much higher It certainly reached 110 F on direct thermometer evidence

Case Report

L. F a well-developed 50-year-old man was admitted to the hospital June 2, 1944, in acute distress suffering from severe colicky pain of five days' duration in the left lumbar region radiating to the groin. His previous medical history was noncontributory

A flat plate revealed two stones in the left ureter above the bladder The patient was cystoscoped on the day following admission Two catheters were inserted to the left kidney around the stones in the ureter An attempt was made to remove the stones by manipulation which was not successful. For the next few days the patient was treated with antispasmodics and sedatives. The stones were small and superimposed on each other and it was thought that they would be expelled by conservative treatment. His temperature was moderate, around 100 F , and his symptoms were relieved. On June 7, 1944 the patient developed a severe chill, followed by a temperature of 104 F Two catheters were inserted around the stones to the pelvis. The temperature dropped to the previous level as soon as drainage was established The culture of the urine from the left kidney showed Bacterium coli and gram-positive cocci.

On June 10 the highest temperature was 99 F and we were encouraged to treat the patient conservatively The catheters were removed. The following day, the temperature rose to 101 F , and the patient had a chill. Later in the evening the temperature rose to 102 F On the morning of June 12 the patient was cystoscoped again An attempt was made to insert the catheters above the stones for the purpose of drainage. This was unsuccessful, because in the meantime the stones had become impacted For this reason it was decided to operate on the patient the same day The operation was scheduled for late in the afternoon. Before the hour of operation, however the patient developed a high temperature rising to at least 110 F This is the nurse s note of June 12, 1944 The patient developed a chill at 3·00 P.M. Immediately after the patient became very violent and maniacal. He was frothing at the mouth. He had convulsive-like twitching. He was given 1/4 grain morphine and 5 grains of sodium luminal intravenously to control him. It required several people to keep him in bed. He was placed in an oxygen tent and in an ice pack.

This is the report of the resident Dr Damask. At 3.30 P M June 12 1944 the patient suddenly became acutely ill. He had several chills and the temperature rose to 109 F , later to 110 F He became delirious and maniacal. The patient was placed in an ice sheet, and alcohol was placed over him. The respirations were labored the pulse rapid Stimulants and narcotics were administered also Ringer's and glucose solution were given intravenously

I saw this patient immediately after he became ill. It required the strength of several people to hold him down in bed. He was cyanotic and dyspneic. The dyspnea, however was undoubtedly caused by his struggling with several people to get out of bed. Because of the condition of the patient, no blood culture was taken at the time. The temperature dropped at midnight of the same day to 98 6 F but rose immediately to 105 F The following morning June 13, 1944 his temperature was 104 F., at which time it was decided to operate. A left nephrectomy was performed, since the patient had a marked pyelonephritis as well as stones in the ureter Following the operation the temperature gradually subsided On the first postoperative day the temperature was 103.4 F and on the fourth day the temperature came down to 100 F and fluctuated thereafter for the next week between 99 2 and 100.8 F after which it came down to normal. The patient was discharged on July 3 1944 about one month after admission. He was in excellent condition.

Summary

A case of hyperthermia caused by a pyelonephritis of the left kidney is hereby reported The patient recovered The temperature in this case rose to at least 110 F , since 110 F is the limit of the thermometer scale It is possible that the temperature was much higher

NATION'S POPULATION DENSITY INCREASING

The density of population in the United States has increased approximately 90 per cent since the beginning of the century, according to the current Statistical Bulletin of the Metropolitan Life Insurance Company

In 1900, there were 25 6 persons per square mile of land area in our country, the Bulletin said This increased to 44 2 persons per square mile by the time of the 1940 census and reached 48 2 persons per square mile by the middle of 1947 Every state in the union showed an increasing density of population in the period 1900–1947, although the relative rise varied markedly from one state to another

Further statistics revealed that the most densely populated area of the country lies along the Atlantic Coast, from the Southern border of Maine to the Northern border of Virginia A second area of population concentration, of lesser density than the Eastern Seaboard, lies around the Great Lakes

Rhode Island was shown to be the most densely populated state in the union with approximately 720 persons per square mile Following in order were Massachusetts, New Jersey, and Connecticut The United States, as a whole, was shown to be one of the less densely settled countries in the world, and the Bulletin forecast that it would continue to be so for many years

As for "wide open spaces," Montana was shown to have only 3 4 persons per square mile, Wyoming, 2 8, and Nevada only 1 3

VITAMIN B-12 SEEN AS EFFECTIVE REMEDY FOR ANEMIA

Dr Tom Spies, professor of nutrition and metabolism in the Northwestern University Medical School, reported in a recent issue of the *Southern Medical Journal* that vitamin B-12, recently isolated, seems to be an effective remedy in treating anemia

Two persons with tropical sprue were admitted to the Havana hospital, and their bone marrow, red and white blood cells, and other blood conditions were completely checked

One of these cases, a 67-year-old Cuban fruit vendor, had all the symptoms of sprue for twenty years Three days after receiving a single dose of eight micrograms of B-12 he felt stronger By the sixth day he ate double portions of all foods offered. The soreness of his tongue had completely disappeared, and his gastrointestinal condition had markedly improved

The second sprue case was that of a 62-year-old man, so weak that he could not work. In the two and a half years he had been ill he had lost 70 pounds Three days after receiving a single injection of eight micrograms of vitamin B-12 his appetite returned, and his tongue was so much better that he could eat without discomfort By the sixth day his tongue was normal, and he was eating large quantities of food

Five other cases made similar dramatic recoveries Nevertheless, the question of maintaining patients on this new compound is yet to be answered, Dr Spies points out No other therapeutic agent is so effective in anemia in such small amounts

DEPARTMENT OF MEDICAL CARE INSURANCE

CONDUCTED BY GEORGE P FARRELL *Director*

Northeastern New York Medical Service Inc., Albany, New York
Edward R Evans, Executive Director

THE Northeastern New York Medical Service Inc 112 State Street, Albany New York, is the latest voluntary nonprofit medical care plan to organize in New York State The Plan serves the counties of Albany Rensselaer Schoharie Schenectady Montgomery, Fulton, Saratoga Washington, Warren, Essex, and Clinton Each of the medical societies in these counties assisted in the organization of the Plan and has approved it The Plan is also approved by the Medical Society of the State of New York.

The funds to start the Plan were advanced by county medical societies in the operating area according to membership

Officers, Directors and Executive Committee

The Executive Committee is composed of the officers of the corporation and three members elected by the Board of Directors and transacts all business subject to the power and authority of the Board of Directors. Officers and members of the Executive Committee are Charles A Brind Jr president Albany, Dr John E Heslin vice-president Albany Dr Stephen Curtis, vice-president Troy, Dr Lyle A Sutton, secretary, Albany, Donald Slingerand treasurer, Albany, Dr Joseph L Raley Saratoga and Dr Joseph H Cornell Schenectady

In addition to the Executive Committee the Board of Directors is composed of Dr Alton J Spencer Amsterdam, Dr David W Beard Cobleskill, Dr Robert S Kunkel, Gloversville Dr W S Bennett Granville Dr James E. Glenn North Creek Dr Leo F Schiff, Plattsburg Dr James E. Glavin Port Henry, William N Bissell, Edward S Poole James E Glavin Lorne A Davidson, Albany Frank L. Tolman Slingerlands Alfred Renshaw, Loudonville Harold S Turner Troy and the Rev John G Hart Albany All officers and directors serve without pay in the interest of their communities

Edward R. Evans executive director of Associated Hospital Service of Capital District is executive director of the medical plan

Enrollment

Northeastern New York Medical Service is offered only to subscribers of Associated Hospital Service of Capital District. Monthly rates for payroll deduction groups in the medical plan are Individual $1 00 husband and wife (without maternity) $1 75, husband and wife (with maternity) $2.25 husband and wife (with maternity) and all unmarried children under age 18 $2 25

Enrollment is also available to members on a direct payment basis. Quarterly rates are as follows Individual $3.25, husband and wife (without maternity) $5 60 husband and wife (with maternity) $7.35 husband and wife (with maternity) and all unmarried children under age 18 $7 35

Groups of five or more eligible employes of a single corporation may apply In groups from five to twenty 50 per cent participation is required and in groups over twenty 40 per cent is required

Applicants are eligible to enroll who have not attained age 65, however an applicant over 64 who is a Blue Cross subscriber may enroll regardless of age A subscriber may continue his membership indefinitely If he leaves a group he may continue his contract on a direct pay ment basis at direct pay ment rates

At the end of the first year of operation (December 31 1947) membership reached 22 778 and at the present time is in excess of 40 000

Benefits

The Plan provides service benefits to subscribers whose yearly incomes are not in excess of $2 000 for an individual $2 500 for applicant and spouse, $3 500 for applicant and members of family group The total indemnity for surgical care payable in any contract year shall not exceed $250 for applicant, $150 for any subscriber other than applicant and $450 total for family group

Medical service for hospitalized cases is limited to three weeks with a maximum allowance of $150 Initial hospital visit is $5 subsequent daily visits (limited to one a day) $3 additional visit on the same day $1 50 An extra allowance for long orthopedic cases extending to six weeks with $1 75 per day fourth week, $1.50 per day fifth week and $1.25 per day sixth week for such days as medical care is rendered.

A ten month waiting period is required for maternity care in the home or hospital for which an indemnity of $50 is allowed regardless of subscriber s income A limit of $25 is allowed for emergency first aid in communities where immediate hospitalization is not available

Anesthesia when administered by a physician is limited to $15 when not covered by a Blue Cross contract.

Exclusions

The Plan does not provide coverage for acute alcoholism drug addiction dentistry venereal diseases cosmetic other than restorative surgery mental or nervous disorders after diagnosis for which care by a psychiatrist is required tuberculosis, after diagnosis, as such cases covered by Workmen s Compensation and other laws, and any condition disease or ailment known to exist on the effective date of the contract

Participating Physicians

At the present time 800 doctors are participating in the Plan which represents approximately 100 per cent of all practicing doctors in the operating area.

Upon completion of medical service for a member the doctor submits a claim on forms provided by NEMS The Plan pays the doctor according to the specified benefits listed in the schedule of medical and surgical expense indemnities in the fee schedule

These amounts are in full payment for services rendered to subscribers whose incomes are not in excess of $2,000 for an individual, $2,500 for applicant and spouse, and $3,500 for applicant and members of the family group

For subscribers whose incomes are in excess of the above amounts, the doctor may charge a fee greater than the specified benefits listed in the schedule of fees in the fee schedule The Plan then indemnifies the doctor according to the schedule, credits the subscriber with that amount toward his total bill, and the difference, if any, is payable directly to the doctor by his patient

Northeastern New York Medical Service is the doctor's plan administered by the Associated Hospital Service of Capital District in the interest of economy However, in matters dealing with claims that require special consideration, a Medical Advisory Committee, composed of members of the medical profession, decides on the disposition of these claims in the interest of the doctor and subscriber

---

ANNOUNCEMENT

The Board of Medical Examiners of the State Education Department has notified the State Department of Health of action taken recently by the Board of Regents with respect to the medical licenses of the following persons

Irving Epstein, 59 East 54th Street, New York City License revoked, effective March 1, 1948

Roy Terry Haskell, Akron, Ohio License permitting him to practice medicine in the State of New York revoked, effective June 4, 1948

George Francis Herrity, 455 East 83rd Street, New York City License revoked, effective March 12, 1948

Dwight S Hinsdale, Delanson License revoked, effective January 8, 1948

William M Lindenfeld, 190 Claremont Avenue, New York City License revoked, effective December 9, 1947

Frank E Fink, 161 West 75th Street, New York City License suspended for a period of two years from April 30, 1948, to April 30, 1950

Morris S Marks, 68 East 86th Street and 875 Park Avenue, New York City License suspended for a period of one year, from March 3, 1948, to March 3, 1949

John Hilbert Oberle, 1786 Bathgate Avenue, Bronx. License suspended for a period of one year, from January 9, 1948, to January 9, 1949

Leo J Palmer, Watertown, and 612 Hoffman Street, Elmira License suspended for a period of two years, from February 3, 1948, to February 3, 1950

Leonard R Smith, 157-11 Sanford Avenue, Flushing License suspended for a period of six months from March 2, 1948

Henry Blum, 66 Park Avenue, New York City License revoked, effective March 2, 1948 License restored, effective April 22, 1948

William Q C Bole, 137 Cortland Street, Groton To be censured and reprimanded, effective January 11, 1948

Ladislav Merei, 51-04 Skillman Avenue, Woodside To be censured and reprimanded, effective April 1, 1948

Irving Pinsley, 53 West Merrick Road, Freeport To be censured and reprimanded.

Frank P Redmond, 24 Clove Avenue, Haverstraw To be censured and reprimanded, effective June 4, 1948

George Clifford Rosenberg, 61 Plymouth Road, Rockville Center To be censured and reprimanded, effective March 3, 1948

Joseph Schwartz, 1336 Washington Avenue, Bronx To be censured and reprimanded, effective January 6, 1948

DEPARTMENT OF WORKMEN'S COMPENSATION

CONDUCTED BY DAVID J KALISKI M D , *Director*

THE Medical Appeals Unit of the Industrial Council of the State Labor Department, in a decision affirming the action of the Medical Society of the County of Erie recommended to the Chairman of the Workmen s Compensation Board of the State Labor Department that the application of the American Magnesium Company for an employer's medical license be denied [1]

The appeal to the Medical Appeals Unit was taken by the American Magnesium Company following refusal of the Medical Society of the County of Erie to approve its application for a license. The point at issue was whether a person *other than a duly registered nurse* is qualified in law to be in attendance in the medical bureau and to assist the bureau physician.

The Medical Appeals Unit in a written decision said We have reviewed the record and after due deliberation affirm the Erie County Medical Society on the ground that in a medical bureau of this kind it is important that a *registered nurse* be in attendance at all times if a physician is not in attendance at all hours We recommend to the Chairman of the Workmen s Compensation Board that the application of the American Magnesium Corporation for an employer's medical bureau be denied until such time as this requirement is met.

[1] Erie County Medical Bulletin January 1948 p 16.

WORKMEN'S COMPENSATION BOARD FEE SCHEDULE

The Advisory Committee on Revision of the Fee Schedule, which included in its membership Dr Nathan B Van Etten chairman, as well as Dr Walter P Anderton, has recommended the adoption of a new schedule which has been accepted by Miss Mary Donlon, the chairman of the Workmen s Compensation Board This is a comprehensive document which will be available for distribution shortly after August 1 at 25 cents per copy Orders may be sent to the office of the Board 80 Center Street, New York City 13

EXAMINATION FOR REGULAR CORPS

A competitive examination for appointment in the Regular Corps of the United States Public Health Service in the grade of assistant surgeon (first lieutenant) and senior assistant surgeon (captain) will be held in October The written examination will be conducted October 4 5 and 6 at places convenient to the candidates. The oral examination will be held at various points throughout the country

All applicants must be at least 21 years of age and citizens of the United States, must present a diploma of graduation from a recognized medical school and satisfactorily pass a physical examination performed by Public Health Service officers.

Physicians beginning internship on July 1 1948, will be admitted to the examination Successful candidates will be placed on active duty in the Regular Corps upon completion of internship on July 1, 1949

Applicants for the grade of assistant surgeon must have had at least seven years of educational and professional training or experience exclusive of high school. Applicants for the grade of senior assistant surgeon must have had at least 10 years of educational and professional training or experience, exclusive of high school

Entrance pay for an assistant surgeon with dependents is $5 011 a year and for senior assistant surgeon with dependents $5 551 a year This includes the additional pay of $1 200 for medical officers as well as subsistence and rental allowance. Provisions are made for promotions at regular intervals up to and including the grade of senior surgeon (lieutenant colonel) and for selection for promotion to grade of medical director (colonel) at $9 751 a year Retirement is authorized at either completion of 30 years service or at the age of 64 Full medical care, including disability retirement at three-fourths pay is provided

Application forms may be obtained from Public Health Service Hospitals, District Offices, or by writing to the Surgeon General United States Public Health Service Washington 25 D C

NECROLOGY

Sarkis H Abkarian, M D, eighty-five, of Pelham, died on June 24 He received his medical degree from New York University Medical School in 1889 and practiced in New York City and Pelham until his retirement about ten years ago For many years Dr Abkarian was with the New York City Board of Health He was a former president of the Armenian Medical Society

John Aikman, M D, sixty-three, died at his home in Rochester on July 13 He had charge of the pediatric section at Genesee Hospital and was assistant professor of pediatrics at the University of Rochester School of Medicine Dr Aikman was president of the Rochester Academy of Medicine in 1942 and had been chairman of the pediatrics section of the American Medical Association and the New York State Medical Society Dr Aikman was graduated from New York University College of Medicine in 1908, studied at Harvard University, and served as an intern at Bellevue Hospital, New York City

He also served in the Medical Corps during the first World War Recently, the Rochester Academy of Medicine conferred on him the Albert David Kaiser Medal for long and distinguished service in the field of pediatrics Dr Aikman was known as a world authority on the subject of accidental poisoning of children

J Wilford Allen, M D, eighty-four, of Orchard Hill, White Plains, died on July 17 A graduate of the New York State Homeopathic Medical College and Flower Hospital in 1905, Dr Allen was a former professor of materia medica at the Homeopathic Medical College He was formerly on the staffs of the Broad Street and Hahnemann Hospitals in Philadelphia He was a member of the American Institute of Homeopathy

William Cornelius Couch, M D, seventy-nine, died on July 5 At the time of his retirement in 1937, he had practiced medicine in Watertown for more than thirty years He attended the University of Buffalo Medical School and was graduated from Gross Medical College, University of Colorado, in 1895 Dr Couch was a member of the Jefferson County and New York State Medical Societies, and the American Medical Association

Clifford Ferrins Dowkontt, M D, fifty-four, died on July 15 at his home in New York City A plastic surgeon for thirty years, Dr Dowkontt was a member of the staff of the Plastic Surgery Institute He was graduated from Yale Medical School, *cum laude*, in 1919 He interned at St Luke's Hospital, New York City Dr Dowkontt was interested in plastic surgery, specializing in breast surgery He recently completed a book on the subject which will be published in September

Oswald D Glasberg, M D, forty-nine, New York City, died on July 15 He was graduated from the University of Vienna in 1926 and came to America in 1942 He was a member of the New York County and State Medical Societies and the Medical Circle He was associate dermatologist at City Hospital

Aquin S Kelly, M D, of New York City and Lawrence, Long Island, died on July 20 at the age of seventy He was graduated from Columbia University, College of Physicians and Surgeons, in 1900 and later studied ophthalmology in Vienna Dr Kelly became adjunct visiting ophthalmologist at St Vincent's Hospital in 1906 and later chief of the ophthalmological service there He was an honorary assistant surgeon in ophthalmology at New York Eye and Ear Infirmary and a consulting ophthalmologist at St Joseph's Hospital, Far Rockaway, Queens, and Meadowbrook Hospital, Hempstead

A former president of the New York Ophthalmological Society, Dr Kelly was a fellow of the New York Academy of Medicine, a member of the American Medical Association, New York State and County Medical Societies, and the American Ophthalmological Society He was a diplomate of the American Board of Ophthalmology

Norman J Lebhar, M D, of New York City, died on July 25 He was seventy years of age After studying at the University of London, Dr Lebhar was graduated from Columbia University, College of Physicians and Surgeons, in 1900 He practiced general medicine in New York City for forty-eight years

George Bolling Lee, M D, seventy-five, of New York City, died July 13 Dr Lee practiced in New York City for forty-nine years, after graduating from Columbia University, College of Physicians and Surgeons, in 1896 In 1898 he served as captain and contract surgeon with the United States Volunteers

In the first World War he was a captain in the Army Medical Officers Reserve Corps Dr Lee was on the staffs of Woman's Hospital, the Hospital for Joint Diseases, Bellevue Hospital, and Polyclinic Medical School and Hospital, where he had been professor of gynecology and obstetrics A fellow of the American College of Surgeons, Dr Lee was a member of the American Medical Association, the Greater New York Medical Association, the Academy of Medicine, Bellevue Hospital Alumni Association, and the New York State and County Medical Societies

Samuel McCullagh, M D, seventy-two, died on July 21 at his home in New York City An ear, nose, and throat specialist in New York City since 1903, Dr McCullagh was graduated from the University of Pennsylvania Medical School in 1898 In 1916 he was a medical officer of Squadron A and served with it at the Mexican Border In World War I he served in France in the Army Medical Corps and received the Distinguished Service Medal for his work

For many years Dr McCullagh was associated with the Manhattan Eye, Ear, and Throat Hospital and was also professor of clinical otology at the New York Polyclinic Medical School and Hospital He was a former president of the New York Medico-Surgical Society and of the New York Laryngological Society

He was a member of the American Laryngological, Rhinological and Otological Society New York Otological Society New York Academy of Medicine American College of Surgeons American Medical Association New York County Medical Society, and New York State Medical Society

Arthur Chalmers Martin M D sixty-one of Hempstead died on July 28 President of the Nassau County Cancer Society Dr Martin was for many years head gynecologist at the Nassau County Hospital Mineola He was a founder of the cancer committee in 1928 and was credited with establishing its nursing service the first of its kind in the United States

He organized tumor clinics at Meadowbrook and in Farmingdale and was a director of the Mother s Health Clinic in Mineola Dr Martin was consultant on obstetrics and gynecology to the North Country Community Hospital Glen Cove the Meadowbrook Hospital Hempstead, and the Huntington Hospital A former president of the Medical Society of the County of Nassau the Nassau Obstetrical Society and the Nassau Surgical Society

He was a fellow of the American College of Surgeons and a member of the Brooklyn Gynecological Society, the American Medical Association the Medical Strollers and the New York State Medical Society

James Alexander Miller M.D , seventy-four, of New York City and East Lyme Connecticut died on July 20 A former president of the New York Academy of Medicine and the American College of Surgeons Dr Miller was graduated from Columbia University College of Physicians and Surgeons in 1899

In World War I he served in the American Red Cross in France and for two years as medical director of the Rockefeller Tuberculosis Commission in France. He was awarded the French Legion of Honor in 1919 From 1913 to 1945 Dr Miller was professor of clinical medicine at the College of Physicians and Surgeons He was also consulting physician in tuberculosis at Bellevue Hospital and Woman s Hospital and consulting physician and president of Sprain Ridge Hospital Yonkers Dr Miller was a member of the Association of American Physicians the American Association of Thoracic Surgery the American Clinical and Climatological Association the New York State and County Medical Societies and the American Medical Association

Irving I Shellin, M.D., New York City died on December 20 1917 He was graduated from the University of Moscow Medical School in 1914 and Long Island College Hospital in 1922 Dr Shellin was a member of the Bronx County and New York State Medical Societies and the American Medical Association. He was sixty years of age

William Carl Treder, M.D of Schenectady and Scotia died on July 20 at the age of sixty-eight He received his medical degree from Albany Medical College in 1907 and taught bacteriology and pathology at Syracuse University in 1908 Dr Treder was Glenville health officer from 1913 until 1937 when he became Schenectady health commissioner From 1921 to 1937 he was Schenectady County coroner

Dr Treder was formerly president of the Schenectady County Medical Society and chairman of the Venereal Control Board He was a member of the New York State Medical Society the American Medical Association the American School Physicians Association, and the American Public Health Association

Albert Leopold Wahl, M.D of Mount Vision and Oneonta died on July 1 He was forty-one years of age Dr Wahl received his medical degree from McGill University Montreal, in 1935 During World War II he served in the Medical Corps of the Army Air Corps Dr Wahl was on the staff of Fox Memorial Hospital, Oneonta He was a member of the Otsego County and New York State Medical Societies the Montreal Medico-Chirurgical Society the Pan-American Ophthalmological Association and the Association of Military Surgeons of the United States.

Alfred Wiener M D., died July 21 at his home in New York City He was eighty two years of age In 1889 Dr Wiener was graduated from Columbia University College of Physicians and Surgeons He was on the staffs of St Luke s and Montefiore Hospitals New York City Dr Wiener was a member of the Academy of Medicine the American Academy of Ophthalmology and Otolaryngology, and the New York State and County Medical Societies

---

DOCTORS OUT MAKING CALLS ARE PAGED BY RADIO

Paging doctors away from their offices will be the job of a special radio station to be erected in New York. Telanserphone Inc., has now been granted a construction permit by the Federal Communications Commission to test the feasibility of the plan

The station will provide only one-way transmission. It will serve the Immediate New York area Each doctor enrolled for the service will carry a small portable receiver Each will be assigned an individual code number This will be repeated on the air at intervals until the doctor reports to the station by telephone

The theory behind the plan is that by it any individual doctor when out making calls may be located more easily than by the present procedure in which he is located by telephone where frequently many calls must be made —*Science News Letter July 10 1948*

HOSPITAL NEWS

Postgraduate Course in Orthopedic Surgery

A COURSE for physicians seeking postgraduate work in orthopedic surgery will be given in the fall at the Hospital for Joint Diseases, New York City, according to an announcement made by Frederick Brown, president of the board, and Dr J J Golub, executive director of that hospital

The course, being offered in affiliation with Columbia University, will consist of 11 morning and 11 afternoon sessions held on consecutive Thursdays beginning October 7, 1948, and ending December 25, 1948

The curricula will include a series of lectures, case demonstrations, and conferences on the clinical, diagnostic, therapeutic, pathologic, bacteriologic, chemical, and radiologic aspects of skeletal disease, so integrated as to present a general review of the modern concept of the more important orthopedic diseases

There also will be opportunity for clinical examination of patients

Applications for registration should be made to the office of the assistant dean, graduate medicine, Columbia University, College of Physicians and Surgeons

Roosevelt Hospital Shows Disaster Unit in Action

ROOSEVELT Hospital, New York City, poured its manpower and medical resources into the first portrayal of its newly-organized, peacetime disaster unit on July 27

Set up to cope with civilian catastrophes, the disaster section, said to be the only one existent in a non-city-operated hospital, put on a full-dress rehearsal.

Dr Condict W Cutler, head of the disaster unit and a surgeon, pointed out that the hospital's fifty residential doctors and 141 graduate and student nurses were now ready to join the pool of city-hospital disaster units

Dr Cutler observed that every agency of the hospital was mobilized A dozen nurses stood by in the receiving room Litter bearers, ordinarily orderlies, were ready for the trip from the accident ward

Dr Joe Clemmins, hospital director, remarked that the wartime disaster unit has been revived because the area is "a singularly vulnerable community" He cited the possibility of bus crashes, highway accidents, and building collapses All neighborhood four-alarm fires will find a Roosevelt Hospital disaster team at the scene The hospital is ready, he said, and to prove it 15-page printed instruction sheets, detailing every move of the unit and its personnel, were distributed

New Bread Formula Developed by Department of Mental Hygiene for Use in State Hospitals

A NEW bread formula, adding considerable nutritive value to the flavorful loaf now produced, has been developed by the New York State Department of Mental Hygiene for use in their institutions, Commissioner Frederick MacCurdy has announced The new formula, which includes 6 per cent full-fat soy flour and 8 per cent fat-free dry milk solids, in addition to standard enriched white flour is an outgrowth of the long-range program for improvement of food in State mental hospitals and schools Research studies were initiated by the department three years ago with the appointment of an expert in dietetics and institutional feeding as director of nutrition services for all of the mental institutions

With the cooperation of a leading flour milling company, Cornell University's department of nutrition, and the American Dry Milk Institute, experiments were conducted by the food service department to devise improved recipes for enriched white bread that would increase the protein, vitamin, and mineral content of the daily diet The State institutions, all of which bake their own bread, were instructed to use dry skim milk and soy flour in the bread formulas they were developing for their own use Varying amounts were used by the institution food managers, who reported to the central office on the degree of success they achieved The standard formula finally arrived at was tested in two selected institutions, one with rather old-fashioned bakery equipment and the other having a modern baking plant with new machinery Under both conditions the results were eminently satisfactory, Dr MacCurdy indicated

"The chief objective in introducing an improved bread in State hospitals and schools," the commissioner said, "is to provide in a simple, practical, inexpensive way additional amounts of certain food elements in which the ordinary diet is frequently deficient The elements involved, found in such expensive foods as meat, milk and butter, would have required a prohibitive increase in the cost of the dietary if added in any other way"

"New York State has taken the lead," Dr McCurdy declared, "in producing a bread that not only adds needed food elements to the daily diet, but is more palatable and has better keeping qualities than the average high-grade loaf This significant contribution to the general health and well-being of the patients in our mental hygiene institutions has been achieved at no increase in cost—in some instances at a slight saving The formula has been made available to the institutions of other State departments and to the baking industry It is hoped that its full benefits in dietary enrichment will eventually be passed on to the general public"

Queens Hospital Beds and Premature Baby Centers Considered Urgent Needs

THE Hospital Council of Greater New York, as the official agency for the State Hospital Plan for New York City, announced in its *Bulletin* that it considers general care hospital beds for the Borough of Queens and facilities for the care of premature infants in New York City as urgent needs.

It was pointed out that under the Federal Hospital Survey and Construction Act (Public Law 725) one third of the cost of construction and equipment of approved projects would be provided by Federal funds. Two thirds of the cost must be met by the sponsoring groups—either voluntary or municipal hospitals.

Stressing the need for general hospitals in Queens, the Hospital Council emphasized that the total number of additional beds required is the largest for any of the five boroughs. New York City when considered as one area, has 65 per cent of the estimated total number of beds needed. For that reason its rating in comparison to the upstate regions is 'D' in order of priority

"However, for practical purposes, the Council stated "New York City will not be considered as one entity The degree of need met varies among the different boroughs and for that reason consideration will be given to the borough in greatest need of hospital beds

The Council's Master Plan for Hospitals and Related Facilities recommended that 4,647 general care beds should be located in Queens. Although there are located at present 2,599 beds of that type in Queens, only 1,771 are considered suitable for long range planning

This indicates that the borough requires 2,876 additional general care beds (4 647 minus 1 771 existing suitable) 'On the basis of percentage of need met (basis used by the Commission) Queens has only 38 per cent of the general care beds needed. A special committee has been appointed by the Council to guide and assist potential sponsors in Queens.

Pointing out the lack of adequate facilities for the care of premature infants the Council stated that especially trained personnel is not available except in centers where the number of babies cared for is large enough to warrant the establishment of separate services.

'The number of premature births in New York City, the *Bulletin* said, totalled 10,244 in 1945 and 12,644 in 1946 In 1947 it teached a total of 13 782' The Council emphasized that 'this increase has not been due to a rise in the incidence of prematurity, but is the result of the increase in the total number of live births during the past two years.

'The mortality among these infants is naturally proportional to the weight at birth' the *Bulletin* said. 'The greatest results may be expected in the care of infants weighing between 1,500 and 2 000 Gm., a group in which the mortality is still 18 per cent, although it has been greatly reduced in the past few years' It was pointed out that "infants weighing 1 500 Gm. and more constitute almost 90 per cent of the total number of prematures.'

The Council said that, 'it cannot be expected that all hospitals will be able to care adequately for them. The Department of Health in New York City has developed a program which would provide for the care of premature infants weighing less than 2 000 Gm. in approximately sixteen centers throughout the city It was brought out that 'under this program these infants would be transferred to the centers.

The Hospital Council explained that this program conforms to the general principles of the Master Plan for Hospitals and Related Facilities, which recommends that services which are required in a lesser degree should not be provided in all hospitals.

3,035 Army Hospital Beds Set Aside for Veterans

A TOTAL of 3 035 beds in Army hospitals throughout the United States have been allocated for treatment of veterans, Major General Raymond W Bliss, Surgeon General of the Army has announced. The allocations were made at the request of the Veterans Administration.

Beds allotted for veterans may be used partly for treatment of chronic disabilities with 325 set aside specifically for tuberculosis cases at Fitzsimons General Hospital in Denver

None of the hospital beds allocated will be used for patients who could be treated in domiciles

The list of hospitals where veterans will be assigned beds Army and Navy General Hot Springs Arkansas 175 beds allocated, Brooke General, San Antonio 400 Fitzsimons General Denver, 700 Letterman General San Francisco 175 Madigan General Tacoma, Washington, 350 McCormack General Pasadena, 100 Oliver General, Augusta, Georgia, 125 Percy Jones General Battle Creek, Michigan, 200, Tilton General Wrightstown New Jersey 275 Valley Forge General, Phoenixville, Pennsylvania, 175 Walter Reed General, Washington, D C 50 William Beaumont General, El Paso Texas, 150 Fort Benning Station Columbus Georgia, 50, Fort Belvoir Station Accotink, Virginia, 35 Fort Bragg Station, Fayetteville, North Carolina, 50 and Spokane Air Force Base Station Spokane, Washington 25

Greater New York Nursing Schools Report Increased Enrollments

A SURVEY by the Greater New York Hospital Association has revealed that the recruitment campaign of the Citizens Committee on Hospital Careers has stimulated student enrollment in the city's nursing schools.

Prospects for September 1948 classes surpass those of 1947 in 32 of the 37 registered and five of the nine practical nursing schools in the city Five registered and four practical nursing schools report that prospects for September classes are the same as last year.

Miss Helen Hayes, chairman and Anson C Lowitz, vice-chairman have headed the local drive in collaboration with the national campaign of the American Hospital Association and the Advertising Council to recruit 50 000 nurses.

A complete list of the registered and practical nursing schools in New York can be obtained from the Greater New York Hospital Association 72 Wall Street, New York City 5

High school education is not required for the one-year practical nurse courses.

NEWS NOTES

Formal opening of the new $1,500,000 wing of St Peter's Hospital, Albany, will take place sometime after Labor Day, Sister Mary Esther, hospital administrator, has announced The ten-story addition is to be well equipped with stainless steel equipment

Madison County is to have a laboratory, installed and maintained by the county, at Lenox Memorial Hospital, Canastota, according to a recent announcement

Plans are underway for the enlargement of the 28-year-old Dansville Hospital to 60 beds, with modern equipment which will make it a great medical asset to the Genessee Valley

Albany County has been asked by the County Tuberculosis Association to establish a county health department and a 250-bed tuberculosis hospital. The proposals are part of a report of a long-term planning committee of the association With eradication of tuberculosis and general improvement of health as the objectives, the committee suggests that the proposed health department setup include

Diagnostic chest and treatment clinics, continuance of free chest x-ray examinations on a more extensive scale than currently used, establishment and maintenance of a centralized tuberculosis case register, a county-wide public health nursing service with one nurse for each 5,000 population, and adequate laboratory facilities for public health requirements

With clinical and other services taken over by the Health Department, the tuberculosis association would expand its health education program as its major function in control of tuberculosis

Formal ground-breaking ceremonies were held in July for the new $400,000 service building at Mt St Mary's Hospital, Niagara Falls The building will house two new boilers, a refrigeration plant, laundry, and incinerator

More than 1,500 printed questionnaires, prepared by the community relations committee of the Placid Memorial Hospital fund, have been mailed to residents of Lake Placid, Keene, Keene Valley, Wilmington, Jay, Upper Jay, and the surrounding area

Mrs Raymond C Prime, chairman of the committee, in announcing the poll to seek popular opinion, said that response to the survey is expected to disclose not only what people know and think about the need for adequate, modern hospital facilities, "but will also be of great value in determining what steps to take to supply our area with the type of hospital service our people expect"

Plans for the construction of a 40 by 106 foot Quonset building to relieve present overcrowded conditions at the Potsdam Hospital have been approved by the State Board of Social Welfare in Albany, it has been announced by the hospital's board of trustees The State board is not setting up a rule of permitting Quonset buildings for hospital use in general but authorized the local structure due to the emergency which now exists at Potsdam Hospital

The present hospital building has a capacity of 69 beds, 26 bassinetts, and seven children's cribs At a peak time last year the hospital population reached 108 patients and required utilization of hallways A total of 3,069 patients was treated last year with an average of 88 8 per day

A cancer detection clinic has been organized by the medical staff of Geneva General Hospital It is held at the hospital each Tuesday morning at 10 00 A M

The clinic is staffed by four surgeons Drs Martin Coyne, Robert E Doran, Joseph A Gindling, and Philip W Skinner These surgeons have the aid of consultants Drs Kenneth Fairfax, Henry B Abbott, Bernard Putney, Albert M Crance, William E Achilles, and Gustav Selbach The clinic has the approval of the Ontario County Medical Society, the American Cancer Society, and the New York State Department of Health

The clinic is operating on an appointment and referral basis only to the end that only those patients referred by a physician are taken All reports and recommendations are sent to the patient's physician and are not sent to the patient No treatment is given at the clinic

The Franklin Delano Roosevelt Veterans Hospital, now being built in Crugers Park, south of Peekskill, is now 35 per cent complete, according to a recent announcement from the Corps of Engineers, New York District The project consists of 81 buildings ranging in height from one to four stories

Of the 13 hospital buildings, there will be five continued treatment buildings, a tuberculosis-neuropsychiatric building, two for the infirm, two buildings for acute cases and one for semiacute cases, a building for women patients, and the main clinical building The surgical suite, dental clinic, x-ray clinic, laboratories, pharmacy, and general administrative offices will be located in the main clinical building

All hospital buildings, including the kitchen and mess building, will be connected by closed corridors so that the patient, should he so choose, need never go out of doors The kitchen and mess building will having a seating capacity for 1,200 people, of which 1,008 seats will be for patients, 144 seats for attendants, and 48 seats for staff

Special attention will be given to recreation, entertainment, and occupational therapy work There will be a large gymnasium building which will include a swimming pool The recreation building will feature bowling alleys, canteen, library, billiard room, and music studios

Wyoming County Community Hospital is the first Western New York hospital to enter a comprehensive regional hospital plan, designed to improve the general level of medical care throughout Western New York which has been developed through the postgraduate department of the University of Buffalo Medical School

The plan extends the facilities of the Medical School to practicing physicians and allied medical personnel through the area and brings teaching programs—and in some instances, interns—to qualifying hospitals in the smaller communities.

Each hospital which becomes a part of the plan will enter into affiliation with the Medical School and with one or more of the teaching hospitals now associated with the Medical School—The Buffalo General Meyer Memorial, Millard Fillmore and Children s Hospitals

A symposium on obstetrics was held at the May meeting of the medical staff of Ossining Hospital Speakers were Drs. Spencer Myers, A. S D Eloia Aurelius C Somisa, Harold W Kipp, Joseph J Arminio George Vogel, and Alfred Blazer Discussors of the symposium were Drs. Robert W Helm, J F Schafmeister John W Reilly Edwin H Huntington Charles L. Briant Charles C Sweet R. J Wren M S Rednick B I Kaplan Leon Kienholz, and Bernard Glueck.

From July 1 1947 to June 30, 1948 940 patients were admitted to Mercy General Hospital Tupper Lake for treatment In addition 133 ambulatory patients received treatment in the emergency operating room, laboratory and x ray department, making a grand total of 1 073 patients cared for at the hospital during the year

PERSONALITIES

Honored

To Dr James A. Brussel assistant director of Willard State Hospital first and second prizes in the 1948 national contest of the American Physician s Literary Guild, for a satirical opera, Dr Faust of Flatbush and a short story Cafe au Lait Dr Brussel has captured first and second prizes every year since the contest started three years ago

Appointed

Dr Ralph Horton superintendent of Homer Folks District State Tuberculosis Hospital Oneonta, since 1934, as general director of Tuberculosis Hospitals in the State Health Department s Division of Tuberculosis Albany To the New York State Board of Nurse Examiners for a five-year term, Mrs. Cecelia T Abrahamer principal of the Willard State Hospital School of Nursing

Dr Joseph Earl Snyder, former assistant director of Graduate Hospital of the University of Pennsylvania, as director of Vanderbilt Clinic and administrative assistant in charge of professional services to patients, Columbia Presbyterian Medical Center, New York City

As assistant resident physicians St Joseph s Hospital Yonkers, Dr Basil Harris, Jr , New York City and Rye Dr Frank H Healy, San Bernardino California Dr William S. Hannan Andover Massachusetts and Dr Warren H. Knauer Elizabeth New Jersey All four doctors were formerly at St. Vincent s Hospital, New York City

Elected

Dr Earl C Wagner Tupper Lake, as president of the medical staff of Mercy General Hospital, Tupper Lake, succeeding Dr Morrison J Hosley, Long Lake. As vice-president of the Mercy General Hospital staff, Dr Roy W Bury Faust, and as secretary treasurer Dr Arthur Hershman Brooklyn Dr Emanuel Freund for 12 years a practicing physician in Haverstraw, as president of the medical staff of the Good Samaritan Hospital Suffern.

HORMONE, VITAMIN USEFUL IN COMBATING LIVER ILLS

Use of synthetic male sex hormone for treatment of chronic liver disease was announced by an eight man research team of the University of California Medical School and the U.S Naval Hospital Oakland, California, at the meeting in Chicago of the American Medical Association

The treatment is aimed at helping patients with damaged livers build up body proteins from the meat and other protein foods they eat. In cirrhosis and other forms of liver damage the body may fail to build protein Giving one of the protein building blocks, an amino acid called methionine helps some patients

But others are not helped even by this In such cases the Navy-California scientists advise trying doses of male hormone

Scientists reporting this research are Drs J. W Kinsell G D Michaels, H A. Harper Sheldon Margen W E Larsen A V Holmes D B McCallie, and E. F Evans.

A vitamin test for early detection of liver disease was reported by Drs Shepard Shapiro and Murray Weiner of New York and Dr Paul Unger of Miami

Liver disease is definitely increasing in this country, Dr Shapiro said. Many contracted jaundice while in military service and a notable increase in alcoholism has also played an important part in the rising rate of cirrhosis of the liver

In their test for liver disease, they inject vitamin K, sometimes called the anti-bleeding vitamin through the veins to the liver If the liver is healthy it uses the vitamin normally and completely as shown by its production of the blood-clotting substance prothrombin The diseased liver however utilizes the vitamin only partially and with considerable delay —*Science News Letter July 3 1948*

MEDICAL NEWS

Baruch Fund Sees Gains for Disabled

THE Baruch Committee on Physical Medicine, in its annual report announced that it had achieved three major objectives—increased the number of physicians trained to teach and use physical medicine, provided for more extensive research in physical medicine, and helped insure the proper use of physical medicine in rehabilitation and preparedness programs

The committee was formed in 1944 by Bernard M Baruch in memory of his father, Dr Simon Baruch, a pioneer in physical medicine and a leading American exponent of hydrotherapy

The report was issued by Dr Frank H Krusen, director of physical medicine at the Mayo Foundation, Rochester, Minnesota.

"Although the full effect of the research and training of physicians will not be felt for some time," Dr Krusen said, "there have been immediate effects in the rehabilitation and medical care of thousands of disabled veterans and even more disabled civilians

"Many disabled veterans are today living self-sufficient, independent lives in their own communities because of the increased emphasis given physical medicine and rehabilitation by the military services and the Veterans Administration, an emphasis which would not have been possible without the research and training of physicians provided for by the Baruch Committee

"Through the committee such opportunities are gradually being brought also to the far greater number of civilian casualties of peace"

The report said that of an original allocation of $1,250,000, sums totaling $900,000 were given to Columbia University, New York University, and the Medical College of Virginia to establish three centers for physical medicine and rehabilitation These centers, it was predicted, would serve as models for medical schools and hospitals here and abroad

In addition, research and training projects are being conducted under committee grants at the Massachusetts Institute of Technology, Harvard, Marquette, Washington, and George Washington Universities and the Universities of Minnesota, Illinois, Southern California, and Iowa

Fall Postgraduate Courses by American College of Chest Physicians

THE Council on Postgraduate Medical Education of the American College of Chest Physicians is sponsoring three postgraduate courses in the latest developments in the specialty of diseases of the chest Each of the courses will be of one week's duration and is open to all physicians Tuition fee is $50 for each course, and registration is limited to 50 physicians for the courses being presented in Chicago and New York City Reservations will be accepted in the order received

New York City, November 8 through 12, 1948 First annual postgraduate course presenting the newer aspects of diseases of the chest. Course to be held at the Hotel New Yorker, New York City

San Francisco, California, September 13 through 17, 1948 In cooperation with the University of California Medical School and Stanford University School of Medicine For information write to Stacy R Mettier, M D , head of postgraduate instruction, Medical Extension, University of California, San Francisco, California.

Chicago, Illinois, September 20 through 25, 1948 Third annual postgraduate course presenting the recent developments in all aspects of diagnosis and treatment of diseases of the chest Course to be held at the Hotel Stevens, Chicago

Applications for the course to be given in Chicago and New York City should be made through the Executive Offices, American College of Chest Physicians, 500 North Dearborn Street, Chicago 10

New York City Health Department Openings

THE New York City Department of Health has announced the availability of several positions open in the following categories

1 Pediatrician (two positions) In-service field orientation for nine months or for twelve months Probable stipend $350 per month These are full-time positions and designed to serve as an excellent preparation for physicians interested in exploring the public health field as related to children's services The period of training will be spent in observing and working in various public health activities in relation to children

The basic qualifications for these positions consists of eligibility for the examination by the American Board of Pediatrics These openings should be of particular interest to a physician who is just finishing a residency in pediatrics

2 Physician-in-Training (two positions) Formal academic training in a school of public health leading toward a degree Full tuition and a probable stipend of $350 per month for the eight-month school year will be paid

Applicants for these training positions are required to have an M.D degree from a school recognized by the American Medical Association, one year's internship in a general hospital approved by the American Medical Association, and eligibility to practice medicine in New York State

Applicants interested in these opportunities should communicate immediately with the Bureau of Personnel, Department of Health, 125 Worth Street, New York City 13

The ORIGINAL ENTERIC COATED TABLET OF THEOBROMINE SODIUM ACETATE

Now Available

IN AN ADDITIONAL POTENCY

to meet the requirements and requests of many physicians

THE NEW STRENGTH – 7½ gr enteric coated green tablets with ¼ gr phenobarbital has been formulated for physicians wishing to prescribe the same effective amount of Theobromine Sodium Acetate, but with less amount of sedative

Complete List of Potencies—

THESODATE
(7½ gr) 0.5 Gm.* or (3¾ gr) 0.25 Gm.*

THESODATE WITH PHENOBARBITAL
(7½ gr) 0.5 Gm. with (¼ gr) 30 mg
(7½ gr) 0.5 Gm. with (¼ gr) 15 mg
(3¾ gr) 0.25 Gm. with (¼ gr) 15 mg.*

THESODATE, POTASSIUM IODIDE PHENOBARBITAL
(5 gr) 0.3 Gm. (2 gr) 0.12 Gm. (¼ gr) 15 mg.

* Supplied also in capsules (not enteric-coated) for supplementary medication

PROVIDES A WIDE RANGE OF AN EFFECTIVE MEDIUM FOR TREATMENT IN CORONARY DISEASE.

Tuberculosis Association Report Made Public

THE popular fallacy that tuberculosis is primarily a disease of youth has been exploded when it is shown that 46 is the average age of death from this cause in New York City The information is included in the 1947–1948 annual report of the New York Tuberculosis and Health Association as made public by Dr Kendall Emerson, president

In 1900 the average age at death in New York was 33 years, rising to 34 by 1920 In 1940 the age at death from tuberculosis had jumped to 42, a gain of almost a decade In explaining this age gain, Dr Herbert R Edwards, executive director of the association and former chief of the Bureau of Tuberculosis of the New York City Department of Health, attributed it to advances in public health procedures

"Although it is impossible to lay the cause to any one thing," Dr Edwards said, "it seems that young people, formerly the chief victims of tuberculosis, are better protected against infection now than in past decades Tuberculosis may remain dormant in the body for many years without any clinical evidence of its existence Thus, we may assume that many people now dying of the disease in the older age groups actually became infected thirty or more years ago "

Describing the association's statistical service, headed by Godias J Drolet, as the "intelligence section" in the war against tuberculosis, the report recounted the results of a five-year study of data assembled from 40 tuberculosis clinics, 43 hospitals in the metropolitan area, the Public Health Nursing Service of the Department of Health, and 23 consultation services for private physicians The study showed that central Harlem led the city's 30 health districts with a tuberculosis death rate of 180 per 100,000 population The Gravesend district of Brooklyn had the lowest rate with 17 per 100,000

The average annual death rate from tuberculosis among the city's white population was stated to be 36 per 100,000 and 176 among Negroes The report added that in both racial groups more men than women died of this cause The first quarter of 1948 showed a gain in the total rate for the city of seven per cent, the first such increase since 1943 In 1947 there were 3,128 deaths from the disease in the city, or more than eight for each day of the year

The report cited statistics to show that, since the formation of the association in 1902, the tuberculosis death rate in New York City has dropped from 242 per 100,000 population to just below 40 per 100,000 Case-finding by means of chest x-rays, coupled with intensive educational work, both designed to bring about early care as well as prevention of the disease, were stated to be the most important tasks now before the association During the fiscal year ended on March 31, 1948, 25,824 x-rays were taken in the Bronx, Manhattan, and Richmond under association auspices In the same boroughs 229,774 persons attended showings of motion pictures on health subjects or attended lectures, meetings, and exhibits arranged by the association More than 10,000 families and individuals were assisted with health problems

The New York Tuberculosis and Health Association, which is largely financed through the sale of Christmas Seals, covers Manhattan, the Bronx, and Staten Island, operating in the latter areas through borough committees The association works in close cooperation with the Queens and Brooklyn associations and with the city Departments of Health and hospitals as well as with other official agencies

Medical Civil Service Positions Open

ON OCTOBER 2, 1948, the New York State Department of Civil Service is holding examinations for medical positions The positions available and the number of the examination are as follows associate cancer radiologist, 8,067, senior psychiatrist, 8,212, biochemist, 8,196, dentist, 8,200, junior pharmacist, 8,206, senior laboratory technician (TB), 8,211

The first three examinations are open to residents of any state, while the last three are limited to legal residents of New York State

Applications must be filed on or before August 23, 1948 Application forms and detailed announcements of each position, giving duties and minor qualifications, may be obtained at the following locations Examinations Division, State Department of Civil Service, State Office Building, Albany, New York, or State Department of Civil Service, Room 2301, 270 Broadway, New York City 7

When writing for application forms, specify number and title of the position, and enclose a large self-addressed return envelope bearing six cents postage

Siliform Ampuls Recalled by Manufacturer

DRUGGISTS and the medical profession were urged today by the Federal Security Agency's Food and Drug Administration to return all stocks of Siliform Ampuls to the manufacturer, the Heilkraft Medical Company, Boston, Massachusetts This injection drug, which should be sterile, is potentially dangerous, since samples collected on the market contain living organisms Siliform is injected by some physicians and osteopaths in the belief that it will relieve patients suffering with rheumatism as claimed by the manufacturer

The Food and Drug Administration found the contaminated samples after a routine inspection at the Heilkraft factory disclosed that the Siliform Ampuls had been manufactured without sterilization Intensive recall efforts by the manufacturer and the Food and Drug Administration for the past two weeks have not brought in all the contaminated stocks The article, which moves slowly, was shipped to 37 states from Maine to California and later was redistributed by wholesalers who cannot trace many of their sales Some going back as far as 1946 have been found on the market These ampuls may be in the hands of doctors, hospitals, clinics, and retail and wholesale druggists

S-M-A® builds husky babies

S-M-A is antirachitic. It is derived from tuberculin tested cow's milk. Part of the butter fat of this milk is replaced with animal and vegetable fats. To this are added milk sugar Vitamin A and D concentrate, Carotene, thiamine hydrochloride, riboflavin nia cinamide; also calcium phosphorus and iron.

S-M-A closely approximates mother's milk.

Wyeth

Philadelphia 2, Pa

The S-M-A form is well suited to modifications, as the physician may wish, for special feeding problems.

The Health of New York City

THERE were 61 cases of poliomyelitis and three polio deaths reported to the New York City Department of Health during July, the Department announced This compares with 103 cases and 11 deaths in July, 1944 (last bad polio year in New York City) and 55 cases and six deaths in 1946.

During the first seven months of this year there were 74 polio cases reported to the Department of Health as against 116 cases for the first seven months of 1944 and 76 cases for the similar period in 1946 There were 13 cases reported in July, 1947, and 22 cases in the first seven months last year

"While the number of cases reported this year is an increase over the number in 1947, which was a 'low polio year' here, it is not an alarming increase," Dr Samuel Frant, First Deputy Commissioner of Health, said

"Fortunately the cases in New York City this year are mild, as is proved by the small number of deaths and the fact that in paralyzed cases the paralysis is less than in previous years

"In July, 1944, and July, 1946, there was about one death for every ten cases This year there has been one death in 20 cases Not all cases of polio are accompanied by paralysis," Dr Frant pointed out "In some mild cases there is merely fever, stiffness of the neck and muscular pains which do not go on to paralysis In cases where paralysis does occur complete recovery is not unusual"

In previous years, Dr Frant said, paralytic cases have run from 66 to 75 per cent of all cases reported while this year paralytic cases have dropped to 57 per cent.

There are no vaccines or serums which will provide immunity to the disease, Dr Frant said General measures of hygiene and sanitation, including adequate rest, should be followed

"There is an apparent relation between fatigue and lack of resistance to polio," Dr Frant said "Therefore, it is wise to prevent children from becoming overtired at this season Parents should not, however, restrict their children's ordinary activities The crowding of children should be discouraged, whether it is in swimming pools, at parties, picnics, or elsewhere There is no good evidence that polio is spread by water, there is no objection to swimming"

The 61 cases of polio during July, as reported by boroughs, were Manhattan, 10, Bronx, 22, Brooklyn, 13, Queens, 16, and Richmond, 0

There were 13,715 births reported in July bringing total births for the first seven months of the year to 90,497 In July deaths totaled 6,433 Deaths in the first seven months totaled 49,479

Fellowship in Industrial Psychiatry Awarded at Cornell

DR GRAHAM TAYLOR of the Allan Memorial Institute of Psychiatry, Montreal, has been selected as the first industrial psychiatry fellow in the School of Industrial and Labor Relations at Cornell University, N P Catherwood, dean of the school, recently announced

Believed to be the first of its kind, the fellowship is part of the school's new program to train psychiatrists for the industrial and labor relations field The project, originated by Dr Alexander H Leighton, Cornell psychiatrist, is supported by a grant from the Carnegie Corporation Dr Taylor will begin a two-year program at the school in September He will divide his time during the fellowship between studies and research on the campus and first-hand investigations in industrial plants

Dr Taylor is studying at Allan Memorial Institute under Dr D Ewen Cameron He was graduated from McGill in 1939 and took his M D there in 1943 He later served a rotating internship in Montreal hospitals before joining the Royal Canadian Navy He has made studies of industrial problems as part of his work at the Allan Memorial Institute

Reorganization of City Health Department Announced

THE reorganization of the New York City Department of Health first proposed by Dr Harry S Mustard, Commissioner of Health, and approved by Mayor William O'Dwyer and the Board of Estimate became effective August 2 Under the reorganization 19 different units of the Department are placed in five major divisions, with two divisions headed by deputy commissioners and three divisions headed by assistant commissioners Four other units of the Department, the Bureau of Personnel, Legal Division, Public Information and Analysis units, will operate directly under the Commissioner

Dr Mustard also designated Harry Hollander, former deputy assistant Corporation Counsel, as counsel to the Health Department and chief of the Department's legal division Dr Mustard has designated the two deputy commissioners and three assistant commissioners The persons designated and the divisions they will direct are

Dr Samuel Frant, first deputy commissioner, will coordinate the activities of the other divisions, assign Department staff members, serve as commissioner during any absence of the commissioner, and head the Community Health Services division of the Department

Matthew A. Byrne, who has been deputy commissioner in charge of administrative services since 1946, will continue in that post He will serve as the Department's budget officer, assign nonprofessional personnel and represent the commissioner in dealing with groups of employes

Dr Ralph S Muckenfuss will serve as assistant commissioner in charge of the Preventable Disease and Adult Hygiene Services Division

Dr Leona Baumgartner will serve as assistant commissioner in charge of the Maternal and Child Health Services Division

Jerome Trichter has been named assistant commissioner in charge of the Environmental Sanitation Services Division

Aerosol Inhalation Therapy

GREATLY SIMPLIFIED WITH

SOLUBLE TABLETS

CRYSTALLINE PENICILLIN G POTASSIUM

Each foil wrapped tablet contains 50 000 units, the usual single dose.

The tablet is simply dropped into the nebulizer

10 to 15 minims of water or saline solution are added with a dropper

and the prescribed dose is ready for administration.

Aerosol inhalation therapy in the home is rendered exceedingly simple when Soluble Tablets Crystalline Penicillin G Potassium are prescribed Each tablet contains 50,000 units of penicillin, the usual single dose, and is entirely free of binder or excipient. The tablet is simply dropped into the nebulizer 10 to 15 minims of water or saline solution are added, and the patient can then receive the treatment. Thus the need for first dissolving the penicillin and then measuring the required dose is obviated entirely Soluble Tablets Crystalline Penicillin G Potassium dissolve rapidly with slight agitation Available on prescription at all pharmacies in boxes of 24, each tablet individually wrapped in foil

C.S.C. Pharmaceuticals

A DIVISION OF COMMERCIAL SOLVENTS CORPORATION 17 EAST 42ND STREET NEW YORK 17 NEW YORK

[Continued from page 1856]

Under the reorganization now in effect the Office of the Secretary of the Department, the bureaus of Maintenance, Audits and Accounts, and Records and Statistics will be under Deputy Commissioner Byrne

Under Community Health Services will come District Health Administration, the Nutrition Division, the Bureau of Nursing and the Bureau of Public Health Education Maternal and Child Health Services cover the bureaus of Mothers and Young Children, Physically Handicapped Children, Dentistry and School Health The Preventable Disease and Adult Hygiene Services will embrace the bureaus of Preventable Diseases, Tuberculosis, Social Hygiene, Laboratories and Adult Hygiene The bureaus of Food and Drugs and of Sanitary Engineering will come under Environmental Sanitation

To replace Dr Muckenfuss as director of the Bureau of Laboratories Gustav I Steffen, Ph D has been named The Bureau of School Health, newly created, is headed by Dr Robert W Culbert

MEETINGS

FUTURE

International Society of Hematology

The first convention of the International Society of Hematology, which was organized two years ago in Dallas, Texas, will be held from August 23 to 26, in Buffalo, with headquarters at the Hotel Statler

Delegates are expected from England, France, Poland, The Netherlands, Norway, Sweden, Argentina, Mexico, and Canada, as well as the United States The convention is being sponsored by the University of Buffalo

Dr Ernest Witebsky, head of the department of bacteriology and immunology of the University of Buffalo Medical School, is chairman of the program committee and of the arrangements committee

American Academy of General Practice

The first meeting of the general membership of the recently formed New York State Chapter of the American Academy of General Practice probably will be held some time in September at Syracuse, according to an announcement by Dr W Pierce Taylor of Buffalo, a member of the Board of Directors of the New York State Chapter

Fifth District Branch

The forty-second annual meeting of the Fifth District Branch of the Medical Society of the State of New York will be held on September 14 in Watertown

At the luncheon meeting of hospital representatives and physicians, which begins at 12 00 noon at the Black River Valley Club, a panel discussion on hospital problems will be held. Speakers are Dr Malcolm T MacEachern, Chicago, director of hospital activities, American College of Surgeons, Dr Finla G Crawford, vice-chancellor, Syracuse University, Edward J Noble, New York City, chairman, North Country Hospitals Corporation, Esther Thompson, director of nursing education, University of Rochester, and H S C Stephenson, Utica, managing director, Hospital Plan, Inc Moderator will be Dr John J Burke, Albany, executive director, Joint Hospital Survey and Planning Commission

The afternoon session for physicians will be held at 2 30 P M at the Y M C A Building Speakers will be Thomas Clearwater, attorney for the Medical Society of the State of New York, Dr William S Brady, Utica, Dr Dan Mellen, Rome, Dr Richard H Lyons, professor of medicine, Syracuse University, Dr George F Bock, Watertown, Dr Martin F Hilfinger, Syracuse, Dr Olin J Mowry, Oswego, and Dr Murray M Gardner, Watertown

Findings from the Saratoga Spa records*

CORONARY DISEASE

One hundred seven coronary cases were recently studied Of this group 33 were females 74 males the latter being chiefly from executive and professional walks of life. Not a few were physicians The aver age age was 61, the range being 40 to 80 years. The average duration of symptoms was three years the limits being one month to 10 years. In 32 there was a def inite history of coronary occlusion Twenty seven had a history of pre-existing high blood pressure, eight of low pressure

Classified according to the American Heart Association 44 were in Class IIA (activity slightly limited) and 63 in Class IIB (activity greatly limited)

Before beginning a regime each patient was subjected to a thorough physical ex amination together with all indicated laboratory procedures The average of the initial blood pressure readings made at this time was 168-95 The final average figure arrived at was 140-81, a difference of 28 mm of mercury in the systolic and 14 in the diastolic reading These read ings were made after a rest period to obviate the influence of any recent activity

Symptomatic Change According to Age Groups

Age group	No Cases	Improvement		
		Moderate	Marked	None
40-50	11	10	0	1
50-60	41	32	5	4
60-70	34	22	8	4
70-80	18	16	0	2
80-	3	3	0	0
	107	83	13	11

THE EMPIRE STATE'S CONTRIBUTION TO THE MEDICAL PROFESSION

[Continued from page 1858]

National Medical Public Relations Conference

A national medical public relations conference, first of its kind, will be held in St Louis on November 27, Dr George F Lull, secretary-manager of the American Medical Association, has announced

"Shooting at Common Targets in Medical Public Relations" is the theme of the conference, to which will be invited public relations directors, executive secretaries charged with public relations duties, and public relations committee chairmen from each of the 48 state medical societies

Featured for luncheon and dinner talks will be noted and qualified speakers on the following topics "The Public Speaks on Health," "What Public Relations Did for Us," and "Yes, the Profession Needs PR"

At the workshop session, which will be run in the afternoon from two to five o'clock, carefully selected discussion leaders from the state societies will grapple with these six major social issues facing the medical profession selling the need of public relations to state medical society members, encouraging wider use of medical prepayment plans, setting up workable systems for handling night calls, the rebate problem, developing good will with labor, farm, industrial, and co-op groups, and cooperating with health agencies

The conference will immediately precede the annual secretaries-editors meeting, which is being held in conjunction with the annual Interim Session of the American Medical Association, November 28 to December 3

Dr Lull declared that the planning and guiding of the conference would be handled by Lawrence W Rember, William Doscher, and John Bach of the Association's public relations staff

PRECISION BUILT by Expert Craftsmen

The knee-joint cross-section shows that Hanger Artificial Limbs are not complicated mechanisms, not loosely fitted pieces, but a few expertly machined parts carefully assembled by experts. The simple construction making possible the efficient operation of Hanger Limbs is the result of long study and research. It is dependent on precision-made parts properly assembled. Hanger craftsmen are carefully selected and trained for this important work. Each Hanger Limb therefore conforms to specifications developed by years of experience.

In HYPOCHROMIC ANEMIAS!

FERROLIVRON —B—

(INJECTABLE)

- Effective therapy for hypochromic anemia usually requires more than iron administration alone. The balanced rational formula of Ferrolivron B not only provides readily available iron, but also generous quantities of essential B complex vitamins, plus fresh liver (as liver concentrate)
- Each 2 cc. of Ferrolivron B contains:

Liver Extract (10 USP Units—injectable)	100 mgm.
Colloidal Iron	
Hydroxide	19.1 mgm.
Niacinamide	50 mgm.
Pyridoxine Hydrochloride	0.3 mgm.
Riboflavin	0.3 mgm.
Phenol	0.5%
Sodium Citrate	1%

For intramuscular use

Supplied in 30 cc. Vials.

COUNTY NEWS

Cayuga County

Dr Herman O Mosenthal and Dr George Saypol, both on the staff of Post-Graduate Medical School and Hospital, New York City, spoke on the medical and surgical treatment of hypertension at the June meeting of the Cayuga County Medical Society A discussion followed the two addresses Dr C T Yarington, Moravia, president of the society, presided at the dinner meeting

•

On September 16 at 8 30 P M , Dr Richard H Lyons, professor of medicine, Syracuse University, will speak on "The Management of Peripheral Vascular Disease States" The meeting will be at the Osborne Hotel, Auburn, and is sponsored for the members of the Cayuga County Medical Society by the Council Committee on Public Health and Education of the State Medical Society with the cooperation of the New York State Department of Health

Chenango County

The Chenango County Medical Society has endorsed the establishment of a permanent Red Cross blood bank in Norwich. Dr John H Stewart reviewed the blood bank plan for members of the Chenango County Chapter of the American Red Cross at a meeting of the chapter on June 16

•

Dr J G Fred Hiss, of Syracuse University College of Medicine, spoke on the subject of rheumatic fever at the luncheon meeting of the Chenango County Medical Society in June

Cortland County

"Atomic Radiation and Its Effects" was discussed by Dr Joe W Howland, instructor in medicine and dentistry and chief of the division of medical services of the Atomic Energy Commission, University of Rochester School of Medicine, for the Cortland County Medical Society on June 25 The Council Committee on Public Health and Education of the State Medical Society and the New York State Department of Health sponsored the instruction

Dutchess County

At the June 16 meeting of the Dutchess County Medical Society, Dr Raymond D Fear, Ithaca, spoke on ' Health Problems in Dutchess County "

Erie County

Members of the Medical Society of the County of Erie will be guests of the board and staff of the Sisters of Charity Hospital, Buffalo, on September 15, when they will be escorted on a tour of the new hospital building

The Physicians Emergency Service Referral List of the Medical Society of the County of Erie, public service project of the society, was put into active effect and operation on July 15 Designed to make it possible for any resident of the Buffalo area to obtain emergency medical service at any hour of the night or day, the Referral List consists of the names of 32 physicians who have agreed in writing to respond to calls from anyone needing the services of a physician who is unable to reach his family doctor or who has no family physician

Cards setting forth procedural instructions on one side and the list of available doctors on the other side were distributed to fire houses, police stations, Buffalo area hospitals and local "leave-word" services The seeker after medical service is provided with names of doctors from the list and then makes his own choice and puts through his own call

The Erie County Medical Society staged its first annual sports day and dinner in August The Committee on Arrangements was composed of Dr Kenneth G Jahraus, Dr Grant T Fisher, Dr Allen E Richter, Dr Joseph R. Saab, and Dr George E Slotkin The proposal of the stag get-together and fresh-air outing was made by Dr E Dean Babbage, county society president

Fulton County

Members of the Fulton County Medical Society and the staff of the Nathan Littauer Hospital held their annual outing June 23 in Bleecker Dr John Clemans was chairman of the committee on arrangements

Greene County

The annual dinner meeting and ladies' night of the Greene County Medical Society was held on July 13 at the Catskill Country Club

At a brief business session, presided over by Dr William Petry, president, nominations for office, to be filled at the October meeting, were made as follows president, Dr Michael Viviano, vice-president, Dr M K Colle, secretary, Dr William M Rapp, treasurer, Dr Mahlon H Atkinson, chairman legislative committee, Dr P G Waller, public relations and public health, Dr Alton B Daley, delegate to the State convention, Dr Kenneth Bott

Guest speaker for the occasion was William Martin, attorney for the New York State Medical Society

A highlight of the gathering was the honoring of four Greene County physicians, Drs Percy Waller of New Baltimore, William H Newcomb of Cairo, and William M Rapp and Frederick W Goodrich of Catskill, who have reached the fiftieth milestone in the practice of medicine

Jefferson County

Dr Paul A. Bunn, associate professor of medicine at Syracuse University College of Medicine, spoke on "The New Antimicrobial Agents" at the June meeting of the Jefferson County and St Lawrence County Medical Societies at the Thousands Islands Country Club, Alexandria Bay The meeting was also the annual field day outing of members of the two societies

Kings County

Dr Harold Levy has been elected president of the pediatric section of the Kings County Medical Society Other officers elected were Dr Samuel Silber, vice-president, Dr Jacob J Lichterman, secretary, and Dr Irving Weinstock, treasurer

Dr Levy is associate attending pediatrician at

FIRST LAW REGULATING MEDICAL PRACTICE

The earliest records of the territory included in what is now the present City of New York are "The Minutes of the Burgomasters and Scheppens (Aldermen) of New Amsterdam for the years 1653–1664 These records, contained in six manuscripts written in the Dutch language are preserved in the library of the City Clerk Manhattan.

In 1848 the Common Council commissioned Edmund B O Callaghan, M.D a competent Dutch scholar and historian to translate the volumes These records make possible a study of the early growth of the city government The State of New York, then called New Netherland, was headed by Peter Stuyvesant (1647–1664) The earliest law regulating the practice of medicine is a directive issued by *Stuyvesant on December 3 1657*

All surgeons in this City are hereby notified that the court orders them to inquire of their patient whenever they dress a wound who has wounded him and then report it to the Shout (Sheriff) or failing therein they are to pay the fine imposed for making the wound

The fine imposed for making a wound was 25 pounds flemish paid in wampum, four times as much was paid by the person causing the wound if the victim bled.—*New York Medicine July 20 1948*

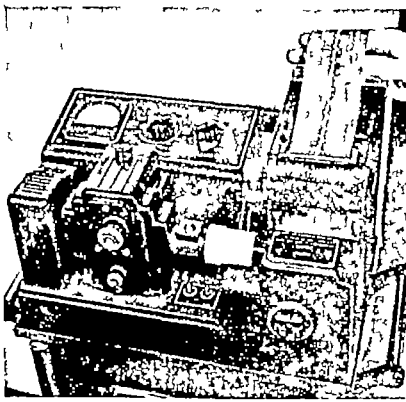
Refreshing



Safeguarded constantly by scientific tests, Coca-Cola is famous for its purity and wholesomeness. It's famous, too, for the thrill of its taste and for the happy after-sense of complete refreshment it always brings. Get a Coca-Cola, and get the feel of refreshment.

The pause that refreshes

A GREAT DIAGNOSTIC TRIUMPH!

Here's the new Beck Lee Model E RA (Recorded Automatic) Electrocardiograph with the Automatic Developing Camera in action It records on a moving strip of photographic paper which is developed within the camera and delivers a finished graph 4 seconds after exposure. The automatic camera eliminates the need for a darkroom and furnishes a graph for immediate diagnosis if necessary

A GREAT BEEBER FIRST!

In keeping with our policy of procuring for our customers the "BEST FIRST," we invite you to see this amazing electrocardiographic instrument in our showroom also view our permanent exhibit of the profession's most honored equipment

SHOCK AND ALLIED FORMS OF FAILURE OF THE CIRCULATION

By H A DAVIS, M D

Associate Professor of Surgery College of Medical Evangelists Los Angeles

Acute failure of the circulation is encountered in every field of clinical practice It is a concern of the surgeon and surgical specialist, the obstetrician the anesthesist. Neither Internist nor general practitioner can escape its threat.

As the urgent circumstances accompanying the onset of shock do not permit prolonged analysis, full familiarity with all its aspects is essential for survival of the patient. What is known about shock its diagnosis and treatment, is consolidated in Dr Davis new book It combines a critical survey of the vast literature with the results of the author's own investigations and extensive clinical experience

VOLUME 48 SEPTEMBER 1 1948 NUMBER 17 PART II

Minutes of the House of Delegates, 1948

For the convenience of the membership of the Medical Society of the State of New York the Publication Committee this year presents the minutes of the House of Delegates in a new and improved manner for the first time. Formerly, the transactions were printed in serial form through a number of issues of the NEW YORK STATE JOURNAL OF MEDICINE. Henceforth, they will be published complete with index in a single volume as a second section to one of the regular issues of the JOURNAL, this year the September 1 issue.

The editors feel sure that you will welcome this opportunity to familiarize yourselves with the most recent actions of your duly elected legislative body A well informed membership is the mark of a progressive society

To give some indication of the importance of the deliberations of your House of Delegates, a few facts about medical affairs in your State may be in order

One fifth of all interns in the United States receive their training in New York State hospitals, one fourth of all United States physicians serve their residencies in New York State hospitals, thirteen per cent of all prescriptions are prescribed by New York State physicians, almost half of the 22,717 New York State physicians are specialists, one-eighth of all the hospital beds are in New York State hospitals

New York State is not only the largest state with respect to population and number of physicians, but continues to be the fastest growing state also, based on the number of *new physicians* who are licensed to practice medicine each year Last year over 1,100 new physicians joined the Medical Society of the State of New York, and this year the number has continued to grow, until now our membership stands at 22,717, twice as many member physicians as the next largest state

Thus, New York, with 15 per cent of all the physicians in the United States occupies a key position in the national medical picture Hand in hand with this tremendous growth has gone New York's progressive spirit of medical leadership, which, at the very beginning, brought about the establishment of the American Medical Association (1847) and later the United States Pharmacopeia Today New York is taking the leadership in much of the battle against socialized medicine and antivivisection, and for licensing reforms, prepayment medical

care plan insurance, chiropractic control measures, better postgraduate medical education, particularly for the general practitioner, and a host of other problems of the day

The transactions of the House of Delegates contain in detail all the resolutions presented, the action of the reference committees and the reports of the Council Committees The new Minutes presentation with its index should facilitate and simplify the problem of finding any action of the House of Delegates

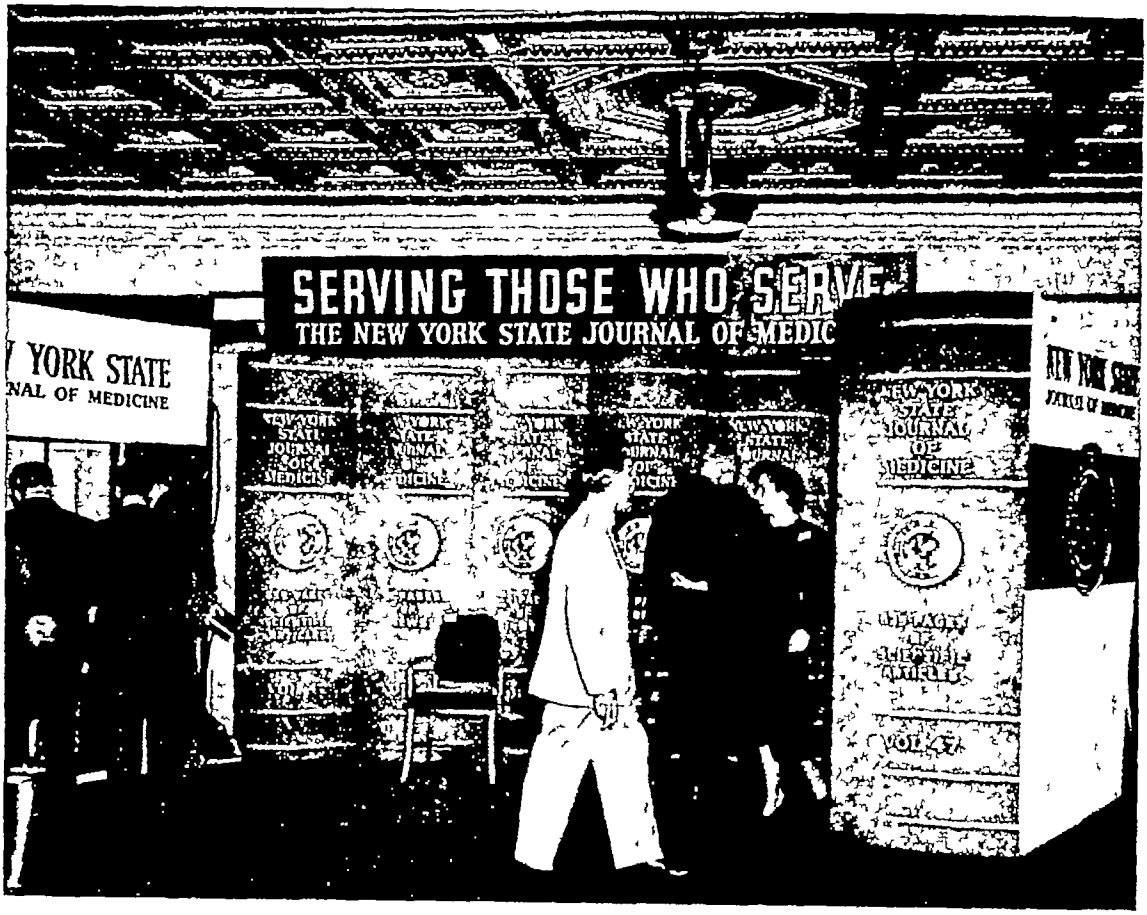
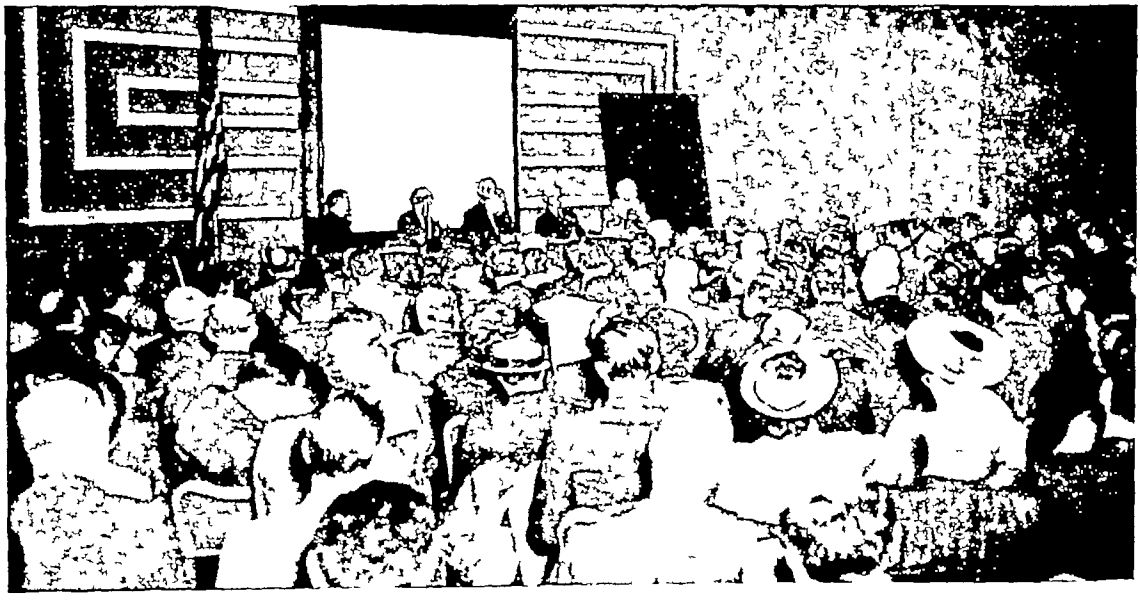
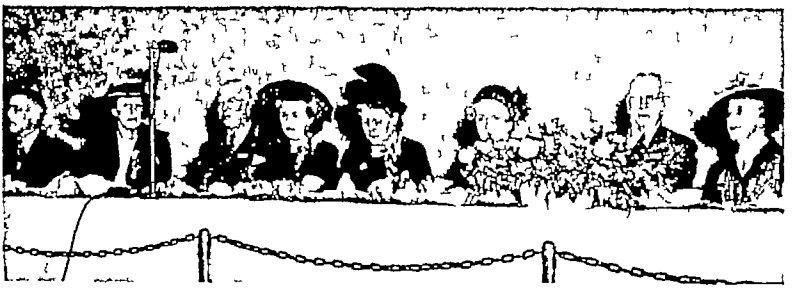
THE 1948 ANNUAL MEETING



Leaders of the Medical Society of the State of New York—past, present, and future—shown at the 142nd Annual Meeting held in New York City from May 17 to May 21, 1948 Above, left to right **Louis H Bauer, M.D**, Hempstead, past-president, **Leo F Simpson, M.D**, Rochester, president, and **John J Masterson, M D**, Brooklyn, president-elect

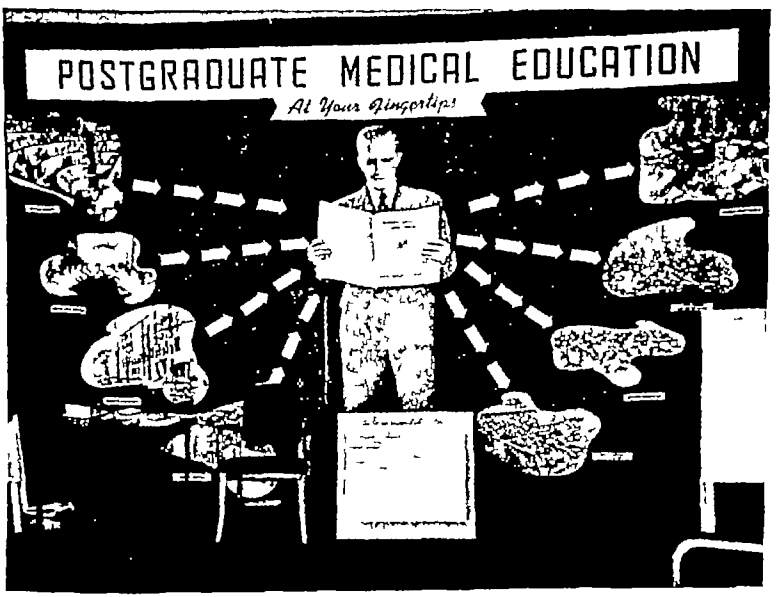


At right, **Albert F R. Andresen, M.D**, Brooklyn, speaker, who presided at the 1948 meeting of the House of Delegates of the State Society

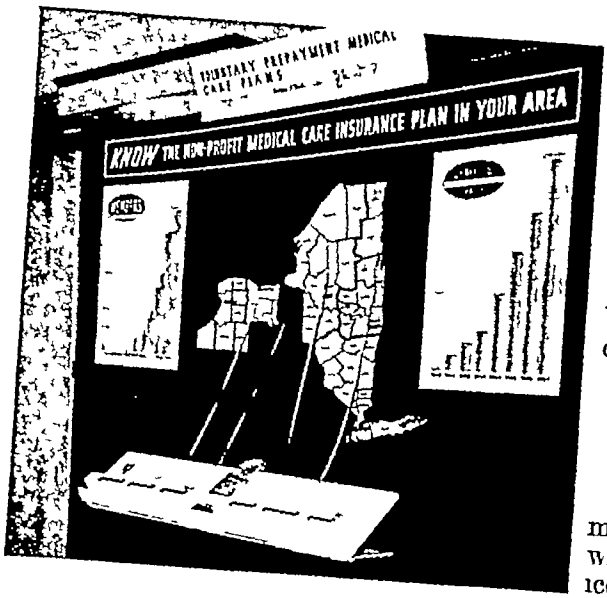


Attendance at the five-day session totaled 6,020, including physicians, exhibitors, members, and guests

A popular exhibit (above) was huge display of the JOURNAL, featuring two picture booths, where delegates and guests received souvenir pictures of themselves—"Partners in Service—You and the Journal"

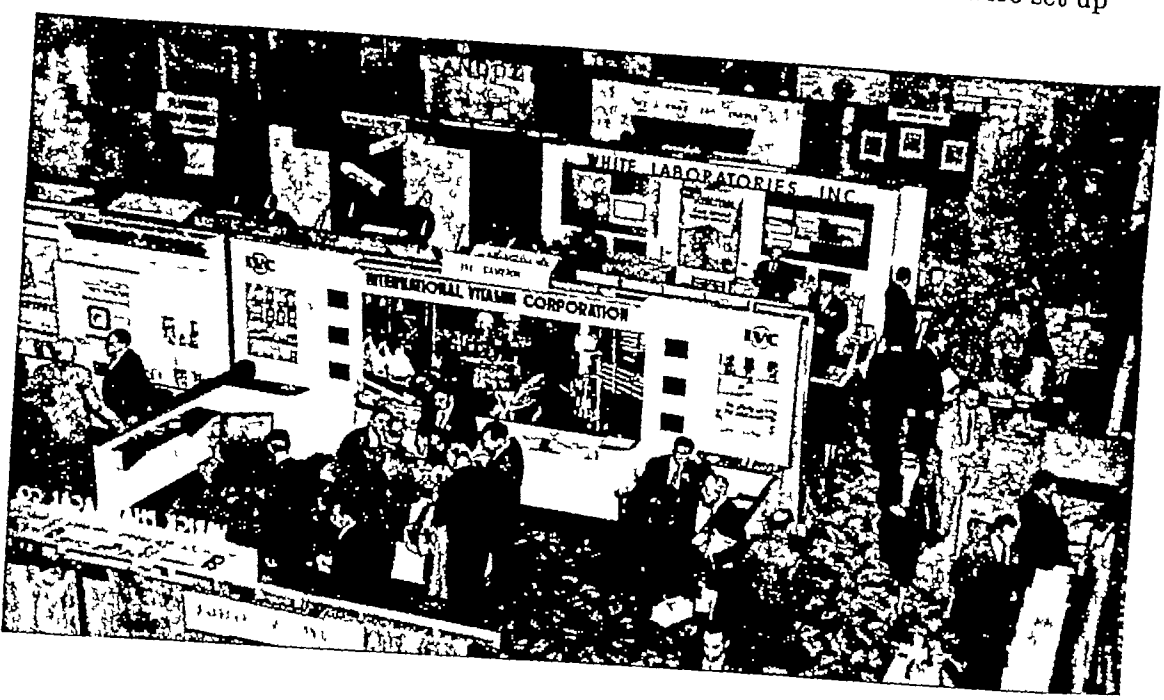


Physicians from metropolitan area and all over State crowded into scientific sessions and Teaching Day programs, as in panel discussion meeting shown below



At luncheon of the Woman's Auxiliary to the Medical Society of the State of New York, held during Annual Meeting—above, left to right Dr Harry F Pohlmann, Mrs. Edgar M Neptune, president of the State Auxiliary, Dr Fenwick Beekman, chairman of the Auxiliary Advisory Council of the State Society, Mrs. Harry F Pohlmann, retiring president of the State Auxiliary, Mrs J Emerson Noll, First District Councilor, Mrs Eustace Allen, retiring president Woman's Auxiliary to the American Medical Association, Dr Nathan B Van Etten, member of the Advisory Council, and Mrs Luther H. Kice, president of the Woman's Auxiliary to the A M A

Display at Annual Meeting showing scope and activities of the postgraduate medical education arranged by the Council Committee on Public Health and Education, O W H Mitchell, M D , chairman



Much interest was evidenced in display of *20,000 Years of Service*, book published by State Society honoring physicians who have served fifty years or more

Medical Care Insurance plans in New York State were explained at colorful exhibit of this Department

Members and guests used many spare moments to visit the Technical Exhibits where new and improved products and services of over 100 companies were set up

Medical Society of the State of New York

House of Delegates

Minutes of the Annual Meeting

May 17 to May 19, 1948

THE 142nd Annual Meeting of the House of Delegates of the Medical Society of the State of New York was held at the Hotel Pennsylvania, New York City, on Monday May 17, 1948, at 10 15 A.M., Dr Albert F R. Andresen *Speaker* Dr Nelson W Strohm *Vice-Speaker* Dr Walter P Anderton, *Secretary* Dr W Guernsey Frey Jr *Assistant Secretary*

SPEAKER ANDRESEN Will the meeting please come to order?

We will now ask for the report of the Reference Committee on Credentials, Mr Secretary

SECRETARY ANDERTON The Reference Committee on Credentials reports there are no disputed delegates, and all on our rolls are entitled to vote.

SPEAKER ANDRESEN I now declare the 142nd Session of the House of Delegates open for the transaction of business.

Section 1

Report of Reference Committee on Credentials

SPEAKER ANDRESEN We will now hear the report of the number of delegates registered from the Credentials Committee Dr McCarty Is there a quorum present?

DR. CHARLES F MCCARTY *Kings* There are registered 106 County Delegates, 14 Officers 7 Section Chairmen and 7 District Delegates

SPEAKER ANDRESEN A quorum is 60 delegates, so we have a quorum present, and can start the transaction of business

Section 2

Approval of the Minutes of the 1947 Session

SPEAKER ANDRESEN The next order of business is the approval of the minutes of the 1947 Session. These minutes have appeared in the August 1 and 15 September 1 and 15 October 1 and 15 and November 1 1947 issues of the NEW YORK STATE JOURNAL OF MEDICINE If there are no corrections or objections the minutes will stand approved as published

Are there any objections or corrections? Hearing none the minutes are declared approved as published

Section 3

Reference Committees

SPEAKER ANDRESEN In regard to the Reference Committees, the list of Reference Committee appointments has been published and all of the members of the Reference Committees have been written to In addition to that we have asked the chairman of each Reference Committee to communicate with the members of his committee and get their opinions in regard to the subjects that have been referred to them. We hope in that way to expedite the business of the House

The list of Reference Committees is as follows

REFERENCE COMMITTEE ON CREDENTIALS
Charles F McCarty *Chairman* Kings
Alfred K Bates, Cayuga
Goodlatte B Gilmore Bronx
George H Burgin, Herkimer
Samuel W Moore New York

REFERENCE COMMITTEE ON REPORT OF PRESIDENT (also Supplementary)
Philip D Allen, *Chairman*, New York

SPEAKER ANDRESEN In these times of important changes taking place in medical practice, in education, and in our general way of living, the Speaker wishes to emphasize the importance of our reference committees It is to them that we look for a careful study of the reports and resolutions referred to them

It is very important that not only officers and committees whose reports are being considered should attend the meetings of these reference committees, but that anyone, whether a member of the House or not, who has any ideas or knowledge in regard to the subjects considered should go there to present them We can save much time of the House and have a much more thorough study if those matters are thoroughly thrashed out in committee instead of on the floor of the House

We have boards set up here on which we would ask the chairmen of the reference committees please to put down the name of their committee and the place where the committee is going to meet Most of the committees are going to meet in the Head quarters Room, which is just to the right as you come out of the door on the corridor, but they have only set up 13 tables there, and we have 20 committees, so that there will be seven committees meeting in this room We will let the chairmen of those committees know shortly which ones are going to meet in this room, and we would request you all to meet there this afternoon at two or three o'clock and work out our very important problems

Section 4

Reference of Reports and Supplementary Reports

SECRETARY ANDERTON I move that the Reports and Supplementary Reports of Officers, Council, Trustees, Legal Counsel, and District Branches that have been published and distributed to the members of the House be referred to the respective Reference Committees without reading

DR. WILLIAM KLEIN *Bronx* I second that motion

There being no discussion the motion was put to a vote and was carried

DR. THOMAS D ANGELO, *Queens* There are certain supplemental reports that have not been even published.

SPEAKER ANDRESEN Those we are going to take up next

DR. FREDRICK W WILLIAMS *Bronx* I voted nay on that last motion because last year we brought in a resolution asking you to have the reports of these officers and Council Committees in the hands of the delegates in ample time in advance of the House so that we could be informed as to how to vote on them. Today we are presented with some five different mimeographed reports on the chair and we don t even know anything about what is in them, yet you are going to ask us to vote on them I don't think that is fair

SPEAKER ANDRESEN We are asking the reference committees to study them and report tomorrow as to how they feel about them. In the meantime every member of the House will have a copy of them, and will be able to study them all afternoon and all night and then tomorrow when we hear the reference committees reports we will be able to act. In the meantime we would like people who are not informed to go to the meetings of the reference committees that are going to consider these supplementary reports and the various subjects and learn something about them before tomorrow morning so that they can vote intelligently upon them.

DR. WILLIAMS The reason I made my objection is that it has been called to my attention there is a suggestion in one of them for a special assessment on the members. You are asking your delegates to vote a special assessment on the members and we don t know how our county feels about a special assessment.

SPEAKER ANDRESEN What do you want to do call up your county this morning and get their authorization or instruction on how to vote on that?

DR. WILLIAMS It would have been much more fair if that report had gotten in early enough to be published so we could have come instructed on that as we suggested in the resolution last year Mr Speaker

SPEAKER ANDRESEN All right but here they are and we have got to thrash these things out this afternoon in the reference committees.

DR. WILLIAMS May I ask that it does not happen again next year?

SECRETARY ANDERTON Excuse me, sir The reason it happens is that the reports arrive at the office so very late If you will get the gentlemen that write the reports to send them in promptly and in plenty of time, we will have them ready for you in the JOURNAL. It is not the fault of the people that have had these mimeographed for distribution. They don t get them in until just the last minute

DR. WILLIAMS I am not questioning whose fault it is. I don t want to delay the meeting by discussing this further but I think someone ought to see that the reports are in on time so that they can be published.

Section 5 (*See 85*)

Annual Report of the Treasurer

To the House of Delegates—Gentlemen

The financial status of the Society is shown in the accompanying letter of transmittal and excerpts taken from the report of our auditors the firm of Patterson and Ridgway, certified public accountants, who examined the books of the Society for the fiscal year 1947

Last year, in the report of the Treasurer it was pointed out that we were operating in the red for the first time in many years The House of Delegates last year voted to increase the State assessment from $10 to $15 This was in May, 1947 but of course did not become operative until this year (January 1 1948)

During the remainder of 1947 expenses of operation continued to increase There were still a great many members of the Society carried on our books whose dues were remitted because of military service Another factor was the necessity of moving the offices and enlarging their size. This latter item entailed a great deal of additional expense and an increased personnel. Therefore, toward the close of the year we found our bank balances were at a perilously low figure and it became necessary for the Board of Trustees to authorize a loan in the amount of $50 000, so that we might continue to pay our current bills

During the course of the year our accounting system has been modernized and brought up to date in many respects. The work in the accounting department has increased because of payroll deductions for withholding tax social security old age pension, and also the proper accounting check system, office purchases sales-advertising and so forth.

The Finance Committee has set up a budget which shows an estimated surplus at the end of the ensuing fiscal year of $38 302. It is to be noted, however that we start the year with a deficit of approximately $50 000 chargeable against the proceding year and it is going to be only by the closest application of economy that we may end up this year in a favorable position

It is believed that, with increased membership the gradual cessation of remission of dues, and the increase in the assessment we will again be able to operate within our dues income However this supposition is predicated on a stable economy If rapidly rising costs should continue we may again find ourselves in the same position we were in last year when as an example the cost of publishing the *Directory* exceeded the previously estimated cost by over 60 per cent

In closing my report I should like to express my sincere thanks and appreciation to all members of the staff of the Medical Society of the State of New York for their helpfulness and cooperation during the past year I also wish to extend my deep personal gratitude to the Assistant Treasurer Dr Fenwick Beekman for his able and kind assistance on a number of occasions when it has been necessary for him to function

Respectfully submitted,

JAMES R. REULING M D *Treasurer*

March 11 1948

presented to this body last year, and have been approved by this body last year, but inasmuch as no favorable action has been obtained on these resolutions the Comitia Minora of the Kings County Medical Society has instructed me to reintroduce these resolutions again

"WHEREAS, a bill to amend Section 1250 of the Education Law of the State of New York in relation to practice x ray diagnosis and treatment, and treatment by radium was introduced in the 1947 legislature, which bill was not passed, therefore be it

Resolved that the Medical Society of the State of New York request that a bill be introduced in the New York State Legislature in 1949 as follows

'X ray diagnosis means that method of medical practice in which demonstration and examination of the normal and abnormal structures, parts or function of the human body are made by use of x rays, and any person who holds himself out to diagnose or able to make or makes any interpretation or explanation by word of mouth writing or otherwise, of the meaning of a fluoroscopic or registered shadow or shadows of any part of the human body made by the use of x rays, and also the use of x rays or radium for the treatment of any human ailment shall be deemed to be engaged in the practice of medicine within the meaning of this article, and Section 1262 as follows The provision of this article shall be deemed to prohibit the practice of x ray diagnosis, x ray therapy, or radium therapy, as defined in subdivision 7A of Section 1250 of this chapter by any person other than a person licensed as a physician a dentist, an osteopath, or a podiatrist.'

Be it further

'*Resolved*, that the Medical Society of the State of New York actively work for the passage of this bill in the Legislature during the year of 1949'

SPEAKER ANDRESEN Referred to the Reference Committee on Report of the Council, Part IX, dealing with Legislation, of which Dr Andrew A Eggston is chairman

Section 37 (*See 115*)

Partnership and Group Practice

DR. AARON KOTTLER, *Kings* This resolution has also been approved by the Comitia Minora of the Kings County Medical Society and I have been instructed to present it to you at this time

WHEREAS, the New York State Legislature enacted Senate Introductory 740 Printing 2142 in the 1947 Legislature which is now a chapter of the laws of 1947 of the State of New York and

WHEREAS, said law amends the Education Law in relation to the practice of medicine by physicians as partners and permits the pooling of fees and monies for medical services by the members of the partnership or group and employes of such partnerships or groups and

WHEREAS, said bill does not specify or limit the number of partnerships or groups to which an individual physician may belong and

WHEREAS, under the present bill a physician might be a member of more than one group and use this as a subterfuge for the division of fees, and also create a situation where said member of more than one partnership might be tempted to render services for less than the agreed fee among the group, and

'WHEREAS, said bill permits a division of the fees with an employe who does not necessarily have to be a physician under the terms of the bill, therefore be it

Resolved that we request that legislation be introduced in the 1949 session of the New York State Legislature amending the recently enacted law concerning group practice or partnership and incorporating therein provisions or amendments to correct the foregoing objections.

SPEAKER ANDRESEN Also referred to the Reference Committee on Report of the Council, Part IX, dealing with Legislation of which Dr Andrew A. Eggston is chairman.

Section 38 (*See 108*)

Change in Constitution of American Medical Association in Regard to Acceptance for Membership of Doctors in County Medical Society Irrespective of Race, Color, or Creed

DR SAMUEL BENNETT BURK, *New York* This resolution is brought forth by direction of the Medical Society of the County of New York, and it relates to a change in the Constitution of the American Medical Association concerning acceptance for membership of doctors in county medical societies irrespective of race color or creed

WHEREAS, some county medical societies in various parts of the United States exclude from their membership physicians of certain races, regardless of their professional ability or ethical standing, and

WHEREAS, physicians so excluded from county societies are thereby excluded from membership or fellowship in the American Medical Association and

'WHEREAS, physicians excluded from membership in the American Medical Association are for that reason denied the right to apply for membership in other national professional societies where membership in the American Medical Association is a prerequisite, and

'WHEREAS, these physicians are thereby restrained in the legitimate pursuit and furtherance of their professional activities and

"WHEREAS, this exclusion of physicians on the basis of race constitutes an affront to our colleagues, a degradation of the honored traditions of our profession and a violation of our American democratic ideal therefore be it

Resolved that Article 4 of the Constitution of the American Medical Association be amended in the following manner The present Article shall be Section 1 of the new Article 4 and the following paragraph shall be added as Section 2 of Article 4

'No component society of the American Medical Association shall exclude any qualified physician from its membership by reason of race creed or color'

and further be it

Resolved, that this proposed amendment shall be introduced at the annual meeting of the House of Delegates of the American Medical Association to be held in 1948

SPEAKER ANDRESEN Referred to the Reference Committee on Miscellaneous Business B of which Dr William B Rawls is chairman.

DR. BURK It so happens that Dr Rawls is our President-Elect and will assume office as President

of the Medical Society of the County of New York soon I, therefore, wonder about the proposed resolution being submitted to his reference committee, but I bow to your judgment, sir

SPEAKER ANDRESEN I don't see why that should make any difference

DR FREDERICK WILLIAMS, *Bronx* After all he is only one member of the committee

SPEAKER ANDRESEN I think he would be particularly good for it

DR BURK The only question I had in mind was that he might be biased in our direction

SPEAKER ANDRESEN I don't believe so I will leave it where it is It has been referred to Reference Committee on Miscellaneous Business B

Section 39 (*See 145*)

United States Participation in the World Health Organization

DR REGINALD A HIGGONS, *Westchester* This resolution is offered by the Westchester County Medical Society

"WHEREAS, the World Health Organization was created under the auspices of the United States to meet medical and health problems on an international scale, and

"WHEREAS, with present day means of transportation, diseases or epidemics in one part of the world are a menace to all other parts, and

"WHEREAS, the bill to provide United States participation in the World Health Organization was passed by the Senate (S J Res 98) last July, and reported favorably by the House Foreign Affairs Committee (H J Res 161), and

"WHEREAS, on March 12, by a vote of 5 to 2, the House Rules Committee decided not to bring this bill before the House for action, and

"WHEREAS, this bill is still withheld by the House Rules Committee, and

"WHEREAS, prompt action must be taken if the United States is to participate in the first assembly of the World Health Organization to be held in Geneva during June, now therefore be it

"*Resolved*, that the House Rules Committee be petitioned by the Medical Society of the State of New York to present this bill for a vote by the House of Representatives in order that the leadership of American Medicine and Public Health may have its rightful voice in dealing with international health problems"

SPEAKER ANDRESEN Referred to the Reference Committee on Report of the Planning Committee for Medical Policies, of which Dr Thomas M D'Angelo is chairman

Section 40 (*See 73*)

Changing Chest Session to Section

DR A F GAFFNEY, *Oneida* The Medical Society of the County of Oneida at its regular meeting at Broadacres Sanatorium on Tuesday, April 13, 1948, instructed its delegates to present the following resolution to the House of Delegates of the Medical Society of the State of New York at its annual meeting in New York City in May, 1948

"WHEREAS, interest in chest diseases is great, as evidenced by large attendance at programs of the Session on Chest Diseases, and

"WHEREAS, great advances are currently being made in the diagnosis and treatment of chest diseases, and

"WHEREAS, more program time is required to present adequately these advances to the profession, therefore be it

"*Resolved*, that the Session on Chest Diseases be made a Section on Chest Diseases"

SPEAKER ANDRESEN This suggestion has already been made by one of the reports, the Report of the Secretary, therefore, this is referred to the Reference Committee on Reports of the Secretary, Censors, and District Branches, of which Dr Leo F Schiff is chairman

Section 41 (*See 114*)

Legislative Committee Activities

DR H J KNICKERBOCKER, Ontario This is not a resolution from Ontario County, it is presented personally

"WHEREAS, in addition to other expenses, bills for which did not pass through the office of the Executive Officer, Dr Robert R Hannon, it cost the State Society $734 32 in 1946, $771 96 in 1947, and $918 50 in 1948 to conduct the annual conference on County Legislative Chairmen, thus making the 1948 conference cost well over $1,000, and

"WHEREAS, the report of the Treasurer and Trustees indicates that unless we administer our available income on a more stringent basis there will again result a deficit, and

"WHEREAS, while these conferences are interesting, instructive, enjoyable and a definite social success, they do not accomplish the purposes for which they were designed due to the apathy and negligence of the County Legislative Committee, and

"WHEREAS, reports read at the 1948 conference prove this to be a fact, and

"WHEREAS, unless these County Legislative Committees wake up, take their assigned duties seriously, and wholeheartedly support the Legislative Committee of the State Society and the Executive Officer, Dr Robert R Hannon, their efforts in our behalf are bound to failure, and

"WHEREAS, this resolution is not to be considered as any reflection or criticism of the State Society's Legislative Committee or Executive Officer, Dr Robert R Hannon, and

"WHEREAS, it would seem to be within the province of some executive division of the Society to institute such changes as may be indicated to the end that the component county societies will become an active integral part of the legislative program, therefore be it

"*Resolved*, that this matter be referred to the Council for consideration and institution of such measures as will make our legislative program an outstanding success"

SPEAKER ANDRESEN Referred to the Reference Committee on Report of the Council, Part IX, Legislation, of which Dr Andrew A Eggston is chairman

Section 42 (*See 113*)

Amendment of Hospital Lien Law to Include Physicians' and Surgeons' Bills

DR DONALD MALVEN, *Dutchess* This is a resolution which has to do with the amendment of the hospital lien law to include physicians' and surgeons' bills, and which I have been instructed to present by the Dutchess County Medical Society, which I represent

"WHEREAS, it is well known that physicians and surgeons treating automobile accident cases

are unable, in many instances to collect the pay ment due them for their services because the patient goes to his home in some distant community as soon as he is able to be moved and settlement of his claim is often made without the physician being aware, so that the aforesaid physicians and surgeons lose considerable sums of money with no redress, and

"WHEREAS, the hospitals in which these cases are treated are protected by Section 189 of the Lien Law be it

'Resolved, that the 1949 session of the New York State Legislature be requested to amend Section 189 of the Lien Law to include the bills of physicians and surgeons for services rendered in the same cases as enumerated in said Section 189 of the Lien Law"

SPEAKER ANDRESEN That is referred to the Reference Committee on Report of the Council, Part IX, Legislation, of which Dr Andrew A. Eggston is chairman.

At this point Dr Edward P Flood, on behalf of the BRONX County Medical Society, introduced a resolution dealing with Action of Council on House of Delegates Directives, which was referred to the *Reference Committee on Report of the Council*, Part IX, but which subsequently on motion was ordered to be physically deleted from the record together with the discussion thereon

Section 43 (*See 119*)

Diversion of Federal Funds for Pediatric Undergraduate, Graduate, and Postgraduate Education

DR. WILLIAM J ORR, *Eighth District Branch*. I have been asked by the American Academy of Pediatrics to submit this resolution to the Medical Society of the State of New York for their consideration and support. It pertains to pediatric education and it is relative to a bill which is to be introduced in Congress by the Academy asking for a diversion of funds from Federal channels into a commission made up of nine pediatricians who are in private practice, which funds are to be used for the furtherance of pediatric education at an undergraduate graduate, and postgraduate level and also in hospitals

WHEREAS, the American Academy of Pediatrics has now concluded a complete two and one-half year survey of pediatric education in all of the approved medical schools and the pediatric departments of all hospitals and of all other child health services, including the care rendered by private physicians, state by state and county by county throughout the United States

'WHEREAS, this survey places the American Academy of Pediatrics in a unique position of knowing the facts related to the needs of child health services

WHEREAS, the Executive Board of the American Academy of Pediatrics has come to the conclusion that the first and most fruitful approach toward a national program for the improvement of child health must be predicated upon increasing and strengthening the teaching of pediatrics at the undergraduate, graduate, and postgraduate levels for general practitioners and pediatricians,

WHEREAS, a program for strengthening pediatric education will increase teaching budgets of medical schools and pediatric departments of hospitals, which even now do not have adequate financial support

WHEREAS, the Executive Board of the American Academy of Pediatrics, after due deliberation as to the availability of possible private sources of revenue has taken under consideration the use of Federal funds to assist these schools and hospitals in a program designed to further pediatric education,

'WHEREAS, to this proposal for Federal funds has been added the requisite that such funds be allotted according to the judgment of nine representative pediatricians and without interference with the policies or internal affairs of the institutions concerned,

'WHEREAS the Executive Board of the American Academy of Pediatrics proposes to submit to *the Congress a constructive program for child* welfare based upon the findings of its survey having thus gathered together the pertinent facts pertaining to child care and pediatric education, therefore be it

Resolved, that the House of Delegates of the Medical Society of the State of New York approve the recommendation of the Executive Board of the American Academy of Pediatrics that Federal grants, such as are now available in other fields of medicine, be provided for training in the medical care and health supervision of children

'*Resolved* further that this resolution be introduced at the meeting of the House of Delegates of the American Medical Association in June 1948"

SPEAKER ANDRESEN Referred to the Reference Committee on Report of the Council, Part II Maternal and Child Welfare of which Dr Thurman B Givan is chairman

Section 44 (*See 131*)

Publication of Articles on the Subject of Medicine

DR. STANLEY B FOLTS, *Seneca* This is a resolution from the Seneca County Medical Society

Be it Resolved by the Seneca County Medical Society, Inc., assembled that the resolution adopted by the House of Delegates of the New York State Medical Society at its 1947 convention which directs all members to seek official approval of the Society for the publication of any article on the subject of medicine written by a member of the Society for the lay press is hereby deemed a forthright violation of the basic principles of free speech and freedom of the press as guaranteed by the United States Constitution

Be it further resolved, that the Seneca County Medical Society Inc. authorize its delegate to petition the House of Delegates of the State Medical Society at the 1948 assembly to revoke the aforementioned resolution,

Be it further resolved, that the House of Delegates of the State Medical Society be further petitioned to expend its energy in the matter of censoring publications in the direction of those individuals who write pseudoscientific papers which are misleading or contrary to established scientific truths or whose articles are dedicated to the purpose of tearing down the traditions and the high standards of our profession

SPEAKER ANDRESEN Referred to the Reference Committee on Report of the Council Part XI Publication and Public Relations of which Dr Theodore J Curphey is chairman

Section 45 (*See 83*)

Enlargement of Council Committee on Workmen s Compensation

Dr Joseph C O'Gorman, *Erie* This first resolution pertains to the enlargement of the Council Committee on Workmen's Compensation of the Medical Society of the State of New York and geographic representation thereon We hope, if this resolution is passed, that the Workmen's Compensation Committee will consist of representatives chosen by each district branch As I say, that is our hope This is from the Medical Society of the County of Erie, but at the last meeting of the Eighth District Branch of Workmen's Compensation Committee chairmen, the principle of this resolution was recommended, and it was instructed that it be presented to the State Society

"Whereas, the Constitution of the Medical Society of the State of New York limits the membership of the Council Committee on Workmen's Compensation to three, and

"Whereas, there exists a definite need for enlargement of this Committee so as to give it wider geographic representation; now therefore be it

"*Resolved*, that the Constitution of the Medical Society of the State of New York be amended by inserting in Article IV, Section 10, thereof, after the sentence beginning with 'The membership of Committees' and ending with 'of the By-laws' the words 'and the Committee on Workmen's Compensation (k) Chapter IV, Section IV, Section 9 of the By-laws'"

There are some committees under the bylaws that may have more than three, so we offer this resolution as an amendment to the Constitution

Speaker Andresen Referred to the Reference Committee on Constitution and Bylaws, of which Dr Peter J Di Natale, of Genesee, is chairman

Section 46 (*See 160*)

Creation by the Medical Society of the State of New York of a Special Committee on the Problems of Alcoholism

Dr Joseph C O'Gorman, *Erie* Alcoholics Anonymous is quite a thing in Erie County, and the County Society has gone out wholeheartedly in back of it It was felt that it was work that was badly needed throughout the State

"Whereas, individuals manifesting the complex symptoms of alcoholism and compulsive drinking are sick persons in need of enlightened, sympathetic, and effective medical care, alcoholism being a disease to be dealt with as such, and

"Whereas, the broad question of the prevention and treatment of chronic alcoholism is a matter of immediate and deep concern to the medical profession of every community of the State of New York, the medical profession being conscious of its obligation to assist in reducing the incidence of chronic alcoholism, in providing adequate facilities for medical and institutional care and rehabilitation of these sufferers, and in re-establishing the chronic alcoholic, both socially and economically, and

"Whereas, there exists widespread demand among members of the medical profession of New York State that the Medical Society of the State of New York assume the leadership in developing within medicine's ranks a well-balanced program—preventive, therapeutic, and rehabilitative—and, furthermore, in stimulating increased interest in this vital problem by all component county societies, now, therefore, be it

"*Resolved*, that the Medical Society of the State of New York, represented in this duly convened annual meeting of its House of Delegates, hereby places itself on record as strongly favoring, approving, and requesting that there be established at the earliest possible date, through appointive action by the President of such State Society, a Special Committee on the Problems of Alcohol, such Special Committee to be representative geographically of all populous sections of the State, and be it further

"*Resolved*, that the Medical Society of the State of New York, through the agency of the proposed Special Committee on the Problems of Alcohol, or the Council of the State Society, urgently request each component county medical society in the State to appoint a local Special Committee on the Problems of Alcohol to function actively in association with its work in the field of public health"

Speaker Andresen Referred to the Reference Committee on Report of the Council, Part V, of which Dr Philip L Forster is chairman

Section 47

Announcement Re Meetings of Reference Committees

Speaker Andresen I would like to make an announcement about the ten committees that will meet in the Headquarters Room and the ten that will meet in Penn Top North on this floor

The following committees will meet in the Penn Top North, 18th Floor

President
Secretary, Censors, and District Branches
Treasurer and Trustees
Planning Committee for Medical Policies
Malpractice Insurance and Defense Board
Report of Legal Counsel
Constitution and Bylaws
Council—Part I
Postgraduate Education
Council—Part II
Maternal and Child Welfare
Council—Part III
Public Health Activities A
Council—Part IV
Public Health Activities B

The following will meet in the Headquarters Room on the 18th floor

Council—Part V
Public Health Activities C
Council—Part VI
Economics, Public Medical Care, Medical Service, Joint Committee of the Hospital Association and the Medical Society of the State of New York
Council—Part VII
Medical Care Insurance
Council—Part VIII
Liaison with Veterans Administration
War Memorial
Council—Part IX
Legislation
Council—Part X
Workmen's Compensation
Council—Part XI
Publication
Public Relations
Council—Part XII
Miscellaneous Conventions, Medical Licensure, Nursing, Woman's Auxiliary, Office

Administration and Policies, Ethics, Memorials
Miscellaneous Business A
Miscellaneous Business B

I would request the chairmen of the Reference Committees to write down as soon as possible the time when they are going to meet. Please put it on the blackboards that have been provided It is very important that everybody should know when and where the committees are going to meet.

Section 48 (*See 84*)

Advertising in the New York State Journal of Medicine

DR. GEORGE W KOSMAK, *Editor* Although not a member of this House, I would like the privilege of saying just a few words with reference to the supplementary reports which have been circulated by the Publication Committee

We hope that you will give your careful attention to the contents of these reports especially in view of the criticism which has been made by the President of the Society

We were stimulated to make the one supplementary report by the tirade which was contained in an editorial published in the *Journal of the American Medical Association* because we felt that this was a matter which could not go unanswered Therefore I would call your particular attention to the facts contained in our report.

I also want to say that the decision as to the admission of any pharmaceutic or other product in our advertising columns depends entirely on the medical members of the Publication Committee

I also want to call your attention to the Supplementary Report dealing with the finances for which the Publication Committee is responsible. We have endeavored to demonstrate to you why costs have increased to this remarkable degree, especially in the last two years.

Thank you!

Section 49 (*See 108*)

Amendment to Article 3, Constitution of the American Medical Association

DR. J LEWIS AMSTER *Bronx* Mr Speaker and members of the House, as a delegate from the Bronx County Medical Society I have been instructed to introduce the following resolution which deals with an amendment to Article 3 of the Constitution of the American Medical Association

WHEREAS, some county medical societies in various parts of the United States exclude from their membership physicians of certain races, regardless of their professional ability or ethical standing and

'WHEREAS, physicians so excluded from county societies are thereby excluded from membership or fellowship in the American Medical Association and

'WHEREAS physicians excluded from membership in the American Medical Association are for that reason denied the right to apply for membership in other national professional societies where membership in the American Medical Association is a prerequisite and

WHEREAS, these physicians are thereby restrained in the legitimate pursuit and furtherance of their professional activities and

WHEREAS, this exclusion of physicians on the basis of race constitutes an affront to our colleagues, a degradation of the honored tradition of our profession, and a violation of our American democratic ideals, therefore be it

'*Resolved*, that Article 3 of the Constitution of the American Medical Association be amended to read

No constituent association shall exclude from membership, any physician for other than professional or ethical reasons;'

and be it further

'*Resolved*, that the Delegates of the Medical Society of the County of Bronx are hereby instructed to introduce this proposed amendment at the annual meeting of the House of Delegates of the Medical Society of the State of New York, to be held in 1948, to the end that this proposed amendment shall be introduced at the annual meeting of the House of Delegates of the American Medical Association to be held in 1948 '

SPEAKER ANDRESEN Referred to the Reference Committee on Miscellaneous Business B, of which Dr William B Rawls is chairman

Section 50 (*See 100*)

Salary Scales for Public Health Physicians in the New York State Department of Health

DR HENRY E. MCGARVEY, *Westchester* This resolution is presented by the Medical Society of the County of Westchester and pertains to Salary Scales for Public Health Physicians in the New York State Department of Health

WHEREAS, the health and welfare of the State of New York are dependent in many ways upon the satisfactory operation and performance of services provided through the New York State Department of Health, and

'WHEREAS, upon investigation it is evident that these services are suffering from a lack of essential medical personnel and

'WHEREAS, the Commissioner of Health is handicapped in making replacements of highly important specialists because of inadequate salary scales and

WHEREAS, present available salaries for public health and laboratory physicians in the State Department of Health are not commensurate with incomes earned by physicians of like experience and training, and

WHEREAS, 48 out of 96 full time medical positions in the State Department of Health remain unfilled as a result of the low salary scales now in effect, and

'WHEREAS, important public health programs and necessary research cannot be carried on because of these conditions and

WHEREAS, these deficiencies threaten the health and welfare of the people of New York State now, therefore be it,

Resolved that the Medical Society of the State of New York respectfully petition the Governor of New York to take prompt action to rectify this situation by means of

1 Upward salary scale revision

2 The delegation of greater latitude to the Commissioner of Health to permit recruitment of personnel above salary scale minimums and

3 The simplification of Civil Service recruitment procedures as they pertain to medical personnel

SPEAKER ANDRESEN Referred to the Reference Committee on Report of the Council Part III of which Dr Harry Golembe is the chairman.

Section 51 (*See 161*)

Study of Alcoholism Problem by State Department of Health

DR ARTHUR F GLAESER, *Erie* I have been requested to present this resolution from the Medical Society of the County of Erie, which deals with a study of the alcoholism problem by the State Department of Health

"WHEREAS, alcoholism is an illness of individual and public concern, and

"WHEREAS, the estimated number of excessive drinkers in New York State is about 283,000 of whom 70,000 are chronic alcoholics, and the amount of suffering on the part of the patients and their dependents as a result of alcoholism is tremendous, and

"WHEREAS, the alcoholic is a sick person who often wants to be helped, but all of the causes of this illness are not known, and

"WHEREAS, medical facilities for the care and treatment of the alcoholic patient are woefully inadequate, and

"WHEREAS, the amount of money spent by government agencies in the ineffectual method of handling the alcoholic through prisons and penitentiaries, plus the amount spent for taking care of the dependents of these individuals, is considerable, now therefore be it

"*Resolved*, that the Governor and the Legislature of New York State be petitioned and urged to direct and authorize the State Department of Health, which is charged by the Public Health Law with safeguarding the health and life of the people of the State, to study the problem of the prevention and alleviation of alcoholism, and to devise methods and programs for the treatment and rehabilitation of chronic alcoholics, the Department to be provided with an adequate appropriation for this project, and, furthermore, that copies of this resolution be transmitted to the officials concerned for their favorable action"

SPEAKER ANDRESEN Referred to the Reference Committee on Report of the Council, Part V, of which Dr Philip L Forster is chairman

I fear that Erie County is going to get a bad reputation It is going to be known as the "alcoholic county" (*Laughter*) We have had two resolutions on that subject from that County Society today

Section 52 (*See 81*)

Specialty Boards

DR ANTHONY C GALLUCCIO, *Bronx* As a delegate from the Bronx County Medical Society I have been instructed to introduce the following resolution on Specialty Boards

"WHEREAS, it has always been the admitted aim of the American Medical Association to encourage hospital affiliations for all physicians, and

"WHEREAS, many hospitals are taking restrictive measures with respect to staff appointments and promotions in order to satisfy requirements established by Specialty Boards, and

"WHEREAS, these requirements of the numerous self-appointed and self-perpetuating Specialty Boards are often arbitrary, variable, and discriminatory, and

"WHEREAS, the accepted method of granting license to practice medicine and surgery is reserved to the various states, and the right to practice a specialty, being a logical extension of this method, should be State-controlled by standards set up through the various state societies and their components, and

"WHEREAS, it has been accepted as a first principle in the administration of American justice that a man be judged by a jury of his peers drawn from his local community, and

"WHEREAS, the Council on Medical Education and Hospitals of the American Medical Association with the concurrence of the Advisory Board for Medical Specialties has stated that,

'Hospital staff appointments should depend on the qualifications of physicians to render proper care to hospitalized patients as judged by the professional staff of the hospital and not on certification or special society membership',

and

"WHEREAS, this entire problem presents a challenge to the ability of the American Medical Association to regulate itself with justice to all members and to advance the cause of Public Health and Welfare through the improvement of medical standards, therefore be it

"*Resolved*, that the Bronx County Medical Society through its Delegates request the Medical Society of the State of New York to take measures to arrest and correct this inequitable situation until such time as means may be found to place certification of specialists on a more reasonable, democratic, and local basis, and be it further

"*Resolved*, that, failing to obtain cooperation from the various Specialty Boards and hospitals, the American Medical Association be requested to withhold recognition from hospitals which make certification by a Specialty Board a necessary qualification for appointment or promotion on a hospital staff, and be it further

"*Resolved*, that the Delegates of the New York State Medical Society to the American Medical Association be instructed to place these resolutions before the 1948 House of Delegates of the American Medical Association"

SPEAKER ANDRESEN Referred to the Reference Committee on Report of the Council, Part XII, of which Dr Joseph A Geis is chairman

Section 53 (*See 112*)

Podiatry Legislation

DR SAMUEL GITLOW, *Bronx* This is a resolution on Podiatry Legislation that was passed at the last session of the House of Delegates, and which incurred the two resolutions from Richmond and Bronx about the action which the Council took This is presented at the behest of the Bronx County Medical Society

"WHEREAS, Podiatry is a technical minor adjunct of orthopedics, and

"WHEREAS, many major systemic diseases have manifestations in lesions of the lower extremity, and

"WHEREAS, the Institute of Podiatry is not a medical school, and

"WHEREAS, the licensed podiatrists have been active in attempting to pass legislation in this State to extend the limitations of their licensure to include treatment of systemic disease, and

"WHEREAS, the treatment of disease constitutes the practice of medicine under the laws of this State, and

"WHEREAS, the passage of such legislation

would be detrimental and hazardous to the public health and welfare, therefore be it

'*Resolved* that the Medical Society of the State of New York put itself on record as being opposed to such legislation, and be it further

'*Resolved* that the Governor and members of both Senate and Assembly be sent copies of this resolution, and be it further

Resolved, that the Legislative Committee and our Albany representative be instructed to govern themselves accordingly and be it further

"*Resolved*, that the content of these resolutions be made known to the Board of Regents of the State of New York."

Section 54 (*See 95*)

Workmen's Compensation—Fee Schedule

DR. RAYMOND F KIRCHER *Albany* As a delegate from the Medical Society of the County of Albany I have been instructed to introduce the following resolution

'In view of the long delay in satisfactory revision of the Workmen s Compensation Fee Schedule of the State of New York which has not been materially altered since its establishment, and in view of the greatly increased costs of the practice of medicine during the recent years,

Be it resolved that the Delegates from the Medical Society of the County of Albany be hereby instructed to present to the annual meeting of the House of Delegates of the Medical Society of the State of New York to be held in May, 1948, this, our protest, against the long delayed action of the Workmen's Compensation Board and the State Medical Society, and which delay has resulted in an unfair financial loss by the physicians of New York State.'

SPEAKER ANDRESEN Referred to the Reference Committee on the Report of the Council, Part X of which Dr Frederic W Holcomb is the chairman and which is dealing with Workmen's Compensation matters

Are there any other resolutions to be introduced?

Section 55 (*See 18 119*)

Change of Reference of Supplementary Report of Council, Part VI, Dealing with Economics

SPEAKER ANDRESEN We have the supplementary report of the Council Part VI, which defines the practice of medicine, and which is the resolution which the x ray men the physiotherapists the pathologists and the anesthesiologists want. That is being referred to the Reference Committee on the Report of the Council Part IX, dealing with Legislation That will embrace what several of the motions today have brought up

Section 56

Announcements

SPEAKER ANDRESEN I also want to announce a meeting of the Board of Directors of the Veterans Medical Service Plan at two o clock this afternoon

Further that you can get tickets to a radio program free for tonight, to see the Chesterfield Show or the Family Quiz or Books on Trial, or Patterns in Melody You may get them at the desk outside

While you are at the desk it will also be a good idea to buy your tickets for the banquet Wednesday night, I have been asked to emphasize that fact

I have also been requested to emphasise what I mentioned before that interviews with physicians and the press should take place in the press room There you can get advice on how to present things properly to the public press.

Are there any further resolutions?

Section 57 (*See 94*)

Workmen's Compensation—To Amend the Law to Abolish the Medical Practice Committee

DR. THOMAS M D ANGELO *Queens* May we introduce any resolutions in the House tomorrow morning?

SPEAKER ANDRESEN We would prefer as many as can to bring them in today so that the resolutions can be referred to the proper reference committees for study and report tomorrow

DR. D ANGELO Queens County has a resolution it would like to present, but it is not here now It is a change in the Workmen s Compensation Law to go back to what it was in connection with the duties of the County Compensation Boards I present it by title only now, but I will give it to the Reference Committee

SPEAKER ANDRESEN You will have it ready for the meeting of the Reference Committee on Report of the Council, Part X, dealing with workmen's compensation matters, this afternoon?

DR. D'ANGELO Yes

SPEAKER ANDRESEN Very well, that will be so referred then to the Reference Committee of which Dr Holcomb is chairman, Report of the Council, Part X

The resolution referred to above is as follows

"WHEREAS, compensation practice in the counties of New York Brooklyn, Bronx, and Queens (of over one million population) under the control of the Medical Practice Committee is discriminatory and not conducive to good administration of the Workmen s Compensation Law, therefore be it

Resolved that the New York State Medical Society urges the Legislature of the State of New York to amend the Workmen s Compensation Law to abolish the Medical Practice Committee, and be it further

Resolved that the support of the county medical societies outside the metropolitan area is urged in order to re-establish a uniform administration of the law throughout New York State '

Section 58 (*See 154*)

Premarital Blood Tests

DR. G S PHILBRICK, *Niagara* This is introduced at the direction of the Niagara County Medical Society

WHEREAS under the present public health law thirty days are allowed in which applicants may apply for a license for marriage and

'WHEREAS, after receiving a license for marriage sixty days are allowed for the applicant to exercise his right to use such license and

'WHEREAS, this gives the applicant ninety days in which he or she may become infected which in effect partially nullifies the benefits of this law, therefore be it

Resolved, that this House of Delegates go on record as being in favor of a shorter period of time between examination and consummation of the marriage and the matter be referred to the Council for appropriate action.

SPEAKER ANDRESEN Referred to the Reference

Committee on Report of the Council, Part IV, Public Health Activities (B), of which Dr Thomas H McGavack is the chairman

Are there any further resolutions?

There was no response

SPEAKER ANDRESEN Any further announcements, Mr Secretary?

SECRETARY ANDERTON I can think of none

SPEAKER ANDRESEN I would like to call your attention to the fact that tomorrow morning we start at nine o'clock We have a full day's work to perform, so we will start promptly at nine o'clock

The meeting is now adjourned until nine o'clock tomorrow morning We hope you will attend the Reference Committee meetings this afternoon

The session adjourned at 12 30 P M

Morning Session

Tuesday, May 18, 1948

The session convened at 9 10 A M

SPEAKER ANDRESEN The House will please come to order

I have a couple of announcements to make, and I will do that right away and get them off my chest First, I want to remind you again to buy your tickets for the Annual Dinner out at the desk

Second, I have an invitation from the United Medical Service to show you how the plan works If you make application for transportation at Booth D on the Mezzanine Floor they will be glad to transport you to their headquarters at Lexington Avenue, where you can see how the Associated Hospital Service and the United Medical Service work

I want to call your attention again to the importance of visiting the Technical Exhibits in order to encourage the people who support us by paying for their exhibits

This morning we want first to get in all of the resolutions that have not so far been presented Remember that after today no other resolutions can be introduced I take it that Erie County has another one on alcoholism (*Laughter*)

Section 59 (*See 21*)

Introduction of Representative from Pennsylvania State Medical Society

SPEAKER ANDRESEN We have with us this morning one of the delegates from our neighboring states who did not come yesterday, Dr Gilson Colby Engel, who is President-Elect of the Pennsylvania State Medical Society He will be escorted to the platform by Dr Aranow

The delegates arose and applauded as Dr Harry Aranow, of Bronx, escorted Dr Gilson Colby Engel to the platform

SPEAKER ANDRESEN Dr Engel is professor of clinical surgery of the Graduate School of Medicine, University of Pennsylvania, President-Elect of the Medical Society of the State of Pennsylvania, Chief of Surgical Service "B," Lankenau Hospital, Philadelphia, and director of the Postgraduate Institute of the Philadelphia County Medical Society

DR GILSON COLBY ENGEL Mr Speaker and members of the House of Delegates, I am deeply grateful for the invitation to be here I also appreciate the amount of work you men have ahead of you today, and I assure you I will not abuse the privilege of getting up and saying a few words

I would like to bring you greetings from the Medical Society of the State of Pennsylvania, and to assure you we watch your every move to see that we can try to keep up to New York, and maybe sometimes go ahead of it, but we have not been able to do that yet

I would like to invite you all to Philadelphia in October It is our Centennial Celebration This must sound like a very weak plea to you men who are meeting here on your 142nd celebration, nevertheless, in Pennsylvania it means a great deal to us We are building up a tremendous program for it, starting October 3, and we invite you all to come over and visit us during that time

There are a lot of remarks I would like to make this morning, but instead perhaps I could say a few words about disaster preparedness I could spend a lot of time on medical service, national compulsory health insurance, and many other problems with which we are confronted, but I defer in all of those to put one point across this morning in which I hope we have New York State's cooperation Your President, Dr Bauer, yesterday, I believe, talked to you about the importance of disaster preparedness It has been duly impressed upon us the importance of such a function in medical organizations, not that we anticipate immediately, and we hope never in the future, an atomic attack, but, nevertheless, we must be prepared for such Doctors in the past have fallen into line with lay organizations and have taken dictation from lay organizations We believe it is about time that the medical profession takes the lead in these problems, and then fits their program into those of lay organizations I think we must stand on our feet and show the public that we are leaders in medical affairs

We have planned in Philadelphia and in the Pennsylvania Medical Society a setup whereby we have a preparedness disaster committee It is on a state level and district councilor level We would like to set it up on a regional level, and I have cleared this morning with Dr Lull and Dr Bauer, so I feel we have clearance with the American Medical Association, and we have clearance with Washington, who are amazed at what has been done up to this point

I would appreciate it very much if this House of Delegates would give your President the authority to appoint a man as chairman of the State Committee on Preparedness Defense We are planning to have a regional conference soon to take in New York, New Jersey, Pennsylvania, Delaware, Maryland, District of Columbia, and Virginia, at which time the fundamental principles involved would be discussed and definite plans would be made as to the personnel of the committee

Our committee is set up down there on a basis whereby we have subcommittees under the first committee The first one is on Monitorization, which is composed of roentgenologists who would break down instruction to the ward level of a municipality, so that the first plan would be monitorizing the whole area to see which part of it is radioactive The second is a Subcommittee on Blood, Blood Substitutes, and Therapy You can well understand the possibilities of that committee The third, and a very important committee, is one on Morale because the government at this time is quite frightened of panic occurring even at the thought of an atomic disaster Emergency Administration is an-

other subcommittee in which will be set up rural emergency hospitals Then the Committee on Epidemiology composed of public health officers for water supplies sewage disposal and the like The last is Public Education and Public Relations That is a tentative plan

I would like it if you men here would as I said before authorize your President to appoint a man as chairman of a State Committee so that we could call on that man to attend a Regional Conference Committee meeting within the next couple of weeks to set this program up on a regional basis

Again may I thank you for the privilege of appearing here before you this morning and I do hope that I have not taken too much time out of your business schedule

Thank you very much! (*Applause*)

Section 60

Introduction of Secretary and General Manager of American Medical Association

SPEAKER ANDRESEN We are honored today in having with us the Secretary and General Manager of the American Medical Association Dr George Lull Dr Bauer our President, will bring Dr Lull to the rostrum

The delegates arose and applauded as Dr Louis H Bauer escorted Dr George Lull to the rostrum

DR. GEORGE LULL Mr Speaker and members of the House of Delegates I bring you greetings from the headquarters of your national organization

I was very much interested in the remarks of Dr Engel I believe that we are going forward in assuming a certain amount of leadership, although we must not lose this opportunity to take hold of this matter of emergency medical service Things are moving quite rapidly in Washington, and unless the people in the various states keep their eyes open they will get ahead of us.

The situation in your national headquarters is quite interesting We employ now more people than we have ever employed in the history of the organization less 90 men who claim they were locked out and are picketing the building and have signs on saying that the doctors' union has locked out the printers' union

You will notice that your *Journal* has been coming through printed so that I hope you can read it. We are not any too proud of the job that is being done the job of printing I mean but we are proud of the fact that we have gotten your *Journal* to you almost on time, and that the material in it can be read even if with difficulty This material now is put up almost entirely by the Barratype process We had some of the printing done in Minneapolis but our union prevailed upon the union who is employed in Minneapolis to refuse the work so although that is probably illegal and the firm could be sued we did not want to be mixed up in a law suit at this time, and it was passed over, however we are getting the *Journal* out.

We are also prepared to house we hope, more doctors than have ever before come to a national meetings in Chicago We believe that we will have not quite so many as came to the Centenary in Atlantic City but we will have more than ever before in Chicago The hotel bureau which handles the registration tells me that the first-class hotels are practically full at this time, and many of the hotels that are not quite first class They still have some rooms available that have not been turned over to them in good hotels.

I don t want to take up the valuable time of this body with remarks which are only of a moderate degree of interest while you have important work to do

Thank you Mr Speaker! (*Applause*)

SPEAKER ANDRESEN Thank you Dr Lull!

Section 61 (*See 105*)

Report of Subcommittee on Cults of the Council Committee on Legislation

The following report was distributed to each one of the delegates

To the House of Delegates—Gentlemen

The Subcommittee on Cults of the Council Committee on Legislation has the following membership

Maurice J Dattelbaum, M D *Chairman* Brooklyn
Charles Gullo, M D , Mt. Morris
Reginald A Higgons, M D Port Chester
O W H Mitchell, M D , Syracuse
Leo F Simpson, M D , Rochester

The Subcommittee was appointed by the President pursuant to a motion unanimously adopted by the House of Delegates on May 7, 1947 authorizing him to appoint a subcommittee of the Council and two members of the House of Delegates to study the methods to be applied for the control of cults and to report its recommendations to the House at the next annual meeting

Meetings of the Subcommittee were held on July 17 and November 12, 1947 and on February 11 and April 7 1948 Present at these meetings, in addition to members of the Subcommittee, were officers and representatives of the Medical Society of the State of New York These included, at one or more of the meetings Dr Louis H Bauer president, Dr W P Anderton, secretary Dr Robert R. Hannon, executive officer, Dr Harry Aranow, chairman of the Legislative Committee, Dr Floyd S Winslow chairman of the Committee on Public Relations, Dr Laurance D Redway literary editor of the NEW YORK STATE JOURNAL OF MEDICINE, Mr William F Martin and Mr Thomas H Clearwater, counsels and Messrs Dwight Anderson, Thomas E. Walsh and Frederick W Misbach of the Public Relations Bureau Also in attendance were Dr Jacob L. Lochner Jr secretary of the Board of Medical Examiners of the New York State Department of Education Mr J W Holloway of the Bureau of Legal Medicine and Legislation of the American Medical Association, Mr Sidney Tartikoff, Assistant Attorney General of the State of New York and Mr Irwin A Conroe Assistant Commissioner of the New York State Department of Education each attended one meeting

Part I —In opening its work, the Subcommittee turned first to the subject of chiropractic and came to the conclusion that a thorough, open-minded study of chiropractic was necessary in order to prove or disprove its value Such a study it was decided could provide a basis for a recommendation by the Subcommittee for legislative action regarding chiropractic and would further serve as a means of evaluating the claims of chiropractors that their methods are scientific

It was pointed out that pressure is constantly being put on legislators to license chiropractors. The legislators ordinarily have nothing to guide them in determining the validity of the claims made by the chiropractors that their practice is scientific. ' The public at large has a tendency to accept chiropractic as propagandized, and when chiropractors are brought to trial juries are reluctant to convict.

An impartial study of the situation was held to be necessary in all fairness to the public

It was decided to name a commission of three members, selected for their scientific standing, to examine carefully the methods used by chiropractors, to weigh the scientific value of their basic tenets, and to submit a report to the Subcommittee on their findings

The Commission subsequently appointed through the assistance of Dr Mitchell consisted of Dr Philip B Armstrong, Professor of Anatomy, Syracuse University College of Medicine, Dr Homer D Keston, Pathologist, White Plains Hospital, White Plains, and LeRoy Barnes, Professor of Biophysics, Cornell University

Members of the Commission were introduced to the members of the Subcommittee at the meeting of November 12, and they were asked by the chairman to approach the problem with open minds

The Subcommittee also discussed the merits of the Basic Science Laws in effect in a number of states, and the degree of success that these laws are achieving in limiting the operations of cults It was stated that New York State has become a "dumping ground" for cultists from other states and that steps are necessary to strengthen the Medical Practice Act Dr Gullo was delegated to obtain information regarding the effect of the Basic Science Laws in other states It was agreed that the work of the Subcommittee should be confidential until a final report is submitted

A final report of the Commission was submitted to the Subcommittee on April 7, 1948 This report stated unequivocally that the fundamental tenets of chiropractic are not scientifically valid and could be of no conceivable value in the development of medical science and teaching

After the report of the Commission was read, it was unanimously approved by the Subcommittee, with the recommendation that the House of Delegates direct the Committee on Public Relations to disseminate it to legislators, members of the judiciary, and to the general public It was suggested that illustrations be added to the Commission's report in order to make the text popularly understandable

The full text of the Commission's report is attached

Part II —The subcommittee devoted considerable attention to an examination of the enforcement of the present Medical Practice Act Mr Tartikoff, Assistant Attorney General in charge of Education, and Mr Conroe, Assistant Commissioner for Professional Education of the State Department of Education, attended the meeting of April 7

Mr Tartikoff summarized his experiences in attempting to obtain convictions of chiropractors for violating the Medical Practice Act He declared that not only the general public, but members of the judiciary as well, appear to be unaware that chiropractic has no scientific foundation, and that the practice of chiropractic, under the New York law, is in fact the practice of medicine After hearing the report of the Commission, he and Mr Conroe recommended that enforcement of the law be strengthened Mr Tartikoff gave the Subcommittee considerable information regarding the means that could be employed to achieve this end Mr Conroe outlined the views of the Department of Education on the subject and said that it was necessary for other agencies to be instrumental in obtaining adequate enforcement

After considering all phases of the matter, the Subcommittee unanimously voted to recommend to the House of Delegates that the Legislative Committee be empowered to draw up and have introduced legislation to implement the enforcement of the present Medical Practice Act by the use of the injunctive procedure against cult practitioners It was suggested that the Legislative Committee consult the legal staff to consider the availability of any other efficacious measures in addition to the injunctive procedure

Part III —During the year, Dr Gullo submitted to the chairman material he gathered in his study of the operation of the Basic Science Laws in other states Much of this material consisted of letters from Basic Science Boards giving information regarding the extent to which the Basic Science Laws have been successful in eliminating cult practice

Dr Gullo submitted to the chairman a summary stating that the Basic Science Law now prevails in 17 states, the District of Columbia, and Alaska. He asserted that the law has justified its existence by the record, which indicates that it has obtained its objective, evidenced by the number of cultists in those states that have the law and by virtually completely preventing further licensure of cultists The record indicates, according to the summary, that in those states that have the law only 125 chiropractors have been licensed since 1925

The Subcommittee also studied an analysis prepared by Dr Walter L Bierring, secretary of the Federation of State Medical Boards of the United States This analysis, after pointing out the lack of uniformity among the 19 existing Basic Science Laws, indicated that the number of chiropractors appearing before Basic Science Boards is decreasing each year It showed further that, in order to control the small proportion of unqualified applicants, all graduates of approved medical schools and many with additional postgraduate training are required to submit to an extra test of knowledge in the fundamental medical sciences by examiners not always familiar with the modern methods of teaching such sciences All of the Basic Science Boards except those of Florida, Michigan, South Dakota, and Washington have the discretionary power to issue a certificate in the basic sciences, without examination therein, to those who present satisfactory evidence of having passed an examination in the basic sciences before a board authorized to issue licenses to practice the healing art of any state, territory, or jurisdiction under the United States

The Subcommittee, after intensive study of the Basic Science Laws in other states, believes there is some merit in the principles involved but recommends that the House of Delegates not approve a Basic Science Law in this State at this time, as our Medical Practice Act performs the same functions

The use of this injunctive procedure, as recommended in Part II of this report, is recommended to control cult practice in New York State.

Respectfully submitted,
MAURICE J DATTELBAUM, M D, *Chairman*
CHARLES GULLO, M D
REGINALD A HIGGONS, M D
O W H MITCHELL, M D
LEO F SIMPSON, M D

Report of the Commission on the Study of Chiropractic to the Subcommittee on Cults —The fundamental tenet of chiropractic claims that all disease is due primarily to pressure on nerves It should be emphasized at the very outset that nerve pressure as the primary cause of disease is only a belief The

chiropractors have not demonstrated its truth by scientific experimentation They have assumed that it is true and, on this assumption, have instituted methods of treatment. There is, however, a large body of scientific fact which conclusively disproves the fundamental tenet of chiropractic.

What does happen when a nerve is subjected to pressure? A nerve is made up of many microscopic fibers some carrying impulses out to muscles or other tissues, others carrying impulses into the central nervous system Pressure on these nerves of sufficient intensity can reduce or abolish their activity If the compressed nerve fibers are running out to the leg muscles these muscles will not contract and, if the condition persists, the muscles will 'wither This is seen as a result of the destruction of nerve cells in infantile paralysis. Or if the nerves are going into the central nervous system from the skin, for example, and are compressed then there will frequently be pain in the area from which the nerves come since the pressure at first irritates the nerves Eventually all sensation from the area will be lost as the pressure produces degeneration of the nerves Nerve fibers have specific functions and these functions are lost with continued pressure on the nerve The area of skin deprived of its nerves does not show increased susceptibility to cancer There are no nerve fibers for kidney disease tuberculosis or diphtheria. The stomach and the heart receive the same kinds of nerve fibers, one type decreasing, the other increasing, the functioning of these organs But even though these organs receive the same types of nerves, the diseases seen in these two organs can be very different and can appear with a normal innervation Pressure on nerves does interfere with nerve function with the specific functions of the compressed nerves.

In a current textbook on chiropractic the authors (Joseph Janse, R H Houser and B F Wells, *"Chiropractic Principles and Technic*, Chicago 1947) maintain "Probably in all abnormal states there is a demonstrable spinal lesion In line with their basic tenet chiropractors have devised methods of manipulation intended to relieve pressure on nerves. Much of their treatment is applied to the vertebral column. The spinal nerves issue from the spinal cord out through openings between adjacent vertebrae These openings are maintained at normal size by resilient pads or disks which keep the adjacent vertebrae apart. If adjacent vertebrae become displaced (subluxated) the opening between the two vertebrae frequently becomes narrowed and pressure on the nerve results with weakness of the muscles supplied by the nerve and pain in its area of distribution, and other effects dependent on the specific functions of the nerve fibers. The chiropractor attempts to reduce the subluxation by manipulation. Permanent reduction of a subluxation by chiropractic manipulation is frequently impossible as many subluxations result from degeneration of the disks between vertebrae which normally maintain the nerve openings No amount of manipulation will restore the degenerated disks.

There is an even greater barrier to the successful application of the chiropractic methods of treatment than that described above Many very important nerves leave the central nervous system through bony openings which are entirely rigid, formed of a solid ring of bone This is true of all the nerves coming from the brain and also the lower spinal nerves. Those from the brain are distributed to all the structures in the face and one of them passes down through the neck and thorax into the abdomen, supplying the heart, lungs stomach, liver, intestines, and other important structures. The lower spinal nerves pass out through the sacrum to the prostate bladder uterus, etc These structures are frequently involved in disease which, according to the chiropractors, is due to pressure on their nerves No amount of manipulation can change the rigid openings through which these nerves pass from the skull or sacrum.

It is impossible to explain disease in some tissues as due to pressure on nerves particularly in those tissues which receive no nerves The blood is subject to a variety of diseases but receives no nerves not even in the bones where most of the blood cells are formed Malaria is a protozoan blood disease transmitted to man by mosquitoes. The organisms can be seen in the red blood cells which circulate throughout the body Where do the chiropractors manipulate to relieve a disease existing throughout the body in the blood a tissue which receives no nerves? Pernicious anemia poses the same problem

Some of the glands of internal secretion which are so important in regulating various activities of the body are not under the control of the spinal nerves. An outstanding example is the pituitary gland the so-called 'Master Gland of the body which is found inside the skull below the brain. The posterior part of this gland is controlled by direct connections from the brain above If these connections are severed, a form of diabetes results Obviously, vertebral subluxations and spinal nerve pressure cannot be concerned in such a condition

Chiropractors claim that if nerve function is interrupted disease commonly results They have not realized that the reverse may be true, that a disease condition may be relieved by interrupting nerves, actually by severing nerves The great neurologic surgeon Dr Harvey Cushing, perfected an operation for cutting one of the nerves entering the brain which gives complete relief from tic douloureaux an extremely painful neuralgia of the face A number of nerve-cutting operations have been devised for the relief of a variety of conditions. When the neurosurgeon severs nerves he knows what the results will be because the nerves have specific functions. Here we see that some disease conditions are relieved by abolishing nerve function which is diametrically opposed to fundamental chiropractic belief

We used to talk about the 'germ theory' of disease. It is now definitely established that a number of diseases are produced by infective organisms. This has been established by painstaking and controlled experimentation repeated again and again. The application of this knowledge in proper sanitation and public health measures has almost completely eliminated some diseases Typhoid killed more men in the Spanish-American War than died in battle In the two great World Wars, it was a rarity being controlled by proper sanitation and immunization. Now, when a case of typhoid appears it can frequently be traced to a carrier The death rate in pneumonia has been cut sharply by the use of penicillin. Penicillin will inhibit the growth of pneumococci in a culture outside the body and is also effective in the treatment of the disease Diphtheria toxin injected into guinea pigs in determined amounts will invariably cause death. Are we to assume that all the guinea pigs have vertebral subluxations? If the diphtheria toxin is preceded by a protecting dose of antitoxin then the guinea pigs do not die. Are we to assume that the antitoxin reduced all the vertebral subluxations? If there is an epi-

demic of infantile paralysis in Buffalo one year but not in Albany, are we to assume that in that year the children of Buffalo suffered a larger number of subluxations than those in Albany? And yet Carver had the temerity to state in his *Chiropractic Analysis*, "The therapeutic theory of germs as a causation of disease is about fifty to fifty-five years old There is nothing in the whole experience of the human family to sustain it" Chiropractors are having to recede from this view since it is incontrovertible that bacteria are the primary cause of many diseases

We would not take our car with engine trouble to a mechanic who believed that all car trouble results from lack of alignment of the front wheels And yet we are doing a comparable thing when we allow the chiropractor, with his erroneous concepts of disease based on false tenets, to manipulate the body All too frequently the end result is tragedy The public should be protected from the errors of such misguided incompetents

Section 62 (*See 139*)

Veterans Administration

DR HERBERT H BAUCKUS, *Past-President* Mr Speaker and members of the House, I have here seven resolutions to present They are resolutions adopted by your Liaison Committee with the Veterans Administration These resolutions were seen and discussed yesterday by the Board of Directors of the Veterans Medical Service Plan, Inc , and they also have approved of these resolutions I do not intend to discuss nor to give a report on the subject at this time I hope that later in the day I may be permitted to report to you on the home town medical care program

I might say that within the last ten days I had the privilege of meeting with Dr Magnuson, the Medical Director, in Washington, and also with representatives of the American Hospital Association

These are the resolutions

"1 That the Medical Society of the State of New York reaffirm its endorsement of a program that will give the veteran the very best medical and hospital care attainable

"2 That any new contract entered into by the Veterans Medical Service Plan, Inc , shall provide for the free choice of physician for the veteran Exceptions to this rule to be made only by mutual agreement by an appropriate committee of the two parties

"3 That the fee schedule be a State-wide schedule approved by both parties and subject to change in specific instances by mutual agreement

"4 That the State Medical Society disapproves of part-time employment of its members in any capacity which shall forbid the private physician from practicing medicine outside of assigned hours, including the care of veterans on a fee basis

"5 There are or have been regulations which deny to former part-time or full-time physicians, resigning from the Veterans Administration, the privilege of caring for veterans on a fee basis for a period of two years following the physician's resignation, excepting only the physicians removing to a distant locality"

I might say that was supposed to be about 150 miles away

"We condemn such interference as un-American in its abrogation of individual rights, a negation of the free choice principle, and a dictatorial, bureaucratic device which limits and obstructs medical service to veterans, at the same time serving as a penalty to physicians, in many cases veterans themselves

"6 That we support the American Hospital Association in its stand against the building of veterans hospitals beyond the present day requirement, that we favor free choice of hospital by the veteran in the service-connected case whether the selection be a veterans, community, or a private hospital, that the expansion under the Hill-Burton plans would provide additional hospital facilities enabling the veterans to choose and have care in their own localities, that as far as can be ascertained at present, if the proposed plan for construction of 92 additional veterans hospitals is carried through, the bed capacity of these hospitals, together with those already existing under the Veterans Administration, will be over twice the calculated bed needs for the next fifteen years

"7 That we recommend the formation of a special committee composed of representatives of the veteran organizations, Veterans Administration, and a special committee of the Medical Society of the State of New York for discussion and consideration of veteran hospital and medical care"

SPEAKER ANDRESEN Referred to the Reference Committee on Report of the Council, Part VIII, of which Dr Joseph P Henry is chairman, and it will be taken up this afternoon in executive session

Section 63 (*See 163*)

Supplementary Report of Council Committee—Part VI

SPEAKER ANDRESEN I now recognize Dr Wertz, who has a report to make for the Economics Committee

DR CARLETON E WERTZ, *Councilor* Your Economics Committee would like to call to your attention a number of factors, some new and some old, which have a great influence on the practice of medicine and on the economics of medicine Many of these factors are countenanced knowingly or otherwise by the profession

Many of us are, perhaps, too busy to appreciate the effects they are apt to have if the profession does not become alert, united, and take a positive stand on the many principles which are now being overlooked, or at the most a mild statement is made and then the entire matter is left in a status quo position

1 The controversy over the four specialities of pathology, anesthesia, physiotherapy, and roentgenology still goes on The American Medical Association and the Medical Society of the State of New York both state that these specialties are included in the practice of medicine, yet many of us are, apparently, willing to allow the hospitals to absorb these definite branches of medicine Physicians in several areas in the State, although voluntary medical plans exist in those same areas, allow the Blue Cross to provide for these specialties

Hospitals, mainly teaching hospitals, have been placing full-time men at the head of departments of otherspecialties such as surgery, medicine, obstetrics, and pediatrics This can, possibly, only mean that the hospitals will take over more and more of the practice of medicine

2 There is a growing development of lay organizations interested in a great many subjects Just to mention a few the National Foundation of Infantile Paralysis, American Cancer Society, National Tuberculosis Association, American Heart Association, American Diabetic Association, Associa-

tion for Spastic Paraplegia, Rheumatic Fever, and many others

Most are educational and diagnostic at present, but how long will it be before they will want to ren der treatment as well?

3 The need for good diagnostic general practitioners and, perhaps, the overemphasis of specialized training

4. The cost of medical care, especially the in creased cost of hospitalization, should make us all stop and think where it is going to stop and how long can the hospitals keep going before seeking relief from the taxpayer either city, state, or federal government and if this occurs what influence will this have on the private practice of medicine

5 There are within the government and certain powerful minority groups, many who desire some form of federalized medicine The drive is ever on Let us never give up the fight. Look at the plight of the British physician today

6 The continued and increased support of the voluntary nonprofit insurance plans sponsored by the Medical Society and by the entire profession is the need today

7 There is a definite movement by the hospital administrators to demand payment in ward cases for medical care from the medical plans This is a prac tice which should never be allowed to exist. It can only lead to placing the hospital more and more in the practice of medicine Only physicians should be paid for services rendered by them

8 Nursing care is an important factor in the care of the seriously ill, and the cost of this service has been steadily rising thus adding greatly to the cost of medical care

SPEAKER ANDRESEN This report really should have been in a month ago so you could have read it for yourselves It will be referred to the Reference Committee on Report of the Council Part VI of which Dr Edward P Flood is the chairman

Are there any other supplementary reports?

There was no response

SPEAKER ANDRESEN Are there any resolutions to be introduced at this time?

Section 64 (See 111)

Report of the Temporary State Commission on Coordination of State Activities (Second Interim Report, March, 1948; The Wicks Commission)

DR NELSON W STROHM, *Vice-Speaker* I would like to present a resolution, Mr Speaker and mem bers of the House of Delegates I apologize for its length but I am encouraged to give it to you be cause of its importance. I bring it to you as chair man of the Council Committee on Medical Licen sure. The subject of it is The report of the Tem porary State Commission on Coordination of State Activities better known as the Wicks Commission

"WHEREAS, a mimeographed copy of the report of the Temporary State Commission on Coordina tion of State Activities (second interim report, March, 1948) (the Wicks Commission) has been re viewed, it is a voluminous report of probably over 400 printed pages which is in the hands of the printers and will probably not be received before July or August Excerpts have been taken from this report and have been distributed to the officers of the State and county societies and other bodies that would be interested and it is thought advisable that some of these recommenda tions be brought to the attention of the House of Delegates for its information and action,

"WHEREAS the following recommendations have been made

"1 The Medical Practice Act should be amended to provide that physicians who fail to register shall be deemed illegal practitioners

"2 The various professional laws should be amended to eliminate all provisions compelling registration with the County Clerk.

"3 To eliminate the uncertainty as to jurisdic tion and authority among various officials con cerned with professional law enforcement, their functions shall be clearly defined and the limits of their authority explicitly stated through the adoption of appropriate rules and regulations and manuals of procedure and through necessary amendment of the Educational Law

"4 The adoption of enforcement of profes sional laws shall be abolished In lieu thereof there shall be established in the Division of Profes sional Education a Bureau of Investigation which shall be charged with the responsibility of making all investigations pertaining to the administration and enforcement of the Professional Laws

5 The granting of injunction to enjoin the illegal practice of the professions shall be provided without the necessity of showing the absence of another adequate remedy or that irreparable damage would result from its denial To obtain such injunctive relief, express statutory authority similar to that now contained in the Pharmacy and Veterinary Medicine Acts shall be included in the proposed article supplementing the profes sional acts

6 Upon the request of the Bureau of Inves tigation the hearing upon the charges shall be held by a hearing officer appointed by the Re gents For this purpose the Regents shall pro vide as many hearing officers as are necessary who are specially qualified to conduct hearings and to prepare findings and recommendations. Two members of the Professional Board involved shall sit as observers at all hearings for and in behalf of the Board

'7 Recommendation abolishing the Board of Examiners and Advisory Councils (there are several)

'8. The department shall either comply with the law, or if the law has proved to be unworkable it should seek to have it amended to conform to practice

9 The determination of credits in all profes sions should be solely the function of the Bureau of Professional Education

10 The Secretary's Office shall forthwith review the status of all such applications, dismiss those which remain incomplete by a predeter mined date.

11 All these applications shall be received and evaluated by the Bureau of Professional Education

' 12 Applications for dispensation of regular requirements for admission to examinations or other licensure shall not be reviewed by the Department Council.

'13 The evaluation of applications for licen sure without examination or other admission to examinations involving dispensation of regular requirements should continue to be performed by the Assistant Commissioner While undoubtedly an operating function the evaluation of such applications is of major importance and should be segregated from the evaluation of routine applica tions for licensure Involved in these applications

are questions of policy-making and precedent-making that are properly the concern of the Assistant Commissioner

"WHEREAS, it can be seen that the above contemplated recommendations are far-reaching, involving important changes in the Educational Law governing discipline and licensure in the medical profession It is most important that the medical profession make known its opinion in respect to these changes at an early date and that these opinions be sent to Senator Wicks and the Board of Regents of the Department of Education, therefore be it

"*Resolved*, that the House of Delegates assembled record their disapproval of the following recommendations Numbers 1, 2, 4, 6, and all its subrecommendations, number 7 and its subrecommendations, and numbers 9, 11, 12, and 13, and that approval of the following recommendations be recorded Numbers 3, 5, 8, and 10"

SPEAKER ANDRESEN Referred to Reference Committee on the Report of the Council, Part XII, of which Dr Joseph A Geis is the chairman

Section 65 (*See 103*)

Malpractice Insurance and Public Relations (Alameda County Plan)

DR. FREDERICK S WETHERELL, *Onondaga* Mr Speaker, members of the House, and distinguished guests, the subject of this resolution is Malpractice Insurance and Public Relations I sat with your hardworking Reference Committee on Malpractice Insurance and Defense yesterday and thought that they were going up the wrong alley to change the present situation of malpractice defense and insurance I even heard the threat that some county societies might withdraw from the general plan of malpractice defense and insurance because their incidence was so low I am using the term "public relations," but the term "public relations" which I am using is not the one which you are acquainted with It is something entirely different. The meaning is entirely different as explained in the current number of the *Bulletin* of the Onondaga Medical Society where the word "public relations" is debunked

"WHEREAS, it is apparent that the cost of malpractice insurance is constantly increasing, and

"WHEREAS, everything that might cause a malpractice claim is a source of bad public relations, and

"WHEREAS, the elimination of these causes serves also to eliminate one category of causes of bad public relations, and

"WHEREAS, among these causes are injury to a patient through negligence or ineptitude, criticism of a colleague's work, made to a patient by another physician, abandonment of the patient, failure to treat each patient with meticulous attention to the requirements of good medical practice, using undue optimism in prognosis, failure to give the patient a clear understanding of the diagnosis or treatment, and

"WHEREAS, it has been proved that removal of these causes by the institution of a militant public relations program has resulted in the practical elimination of malpractice suits, and

"WHEREAS, the Alameda County, California, Medical Society has instituted a plan of medical public relations which has resulted in eliminating malpractice suits for the past two years, be it

"*Resolved*, that the Council of the Medical Society of the State of New York be instructed to study the Alameda County Plan, and as soon as feasible to institute procedures which will end in the employment of measures of like nature in the constituent county societies or district branches of the Medical Society of the State of New York"

SPEAKER ANDRESEN Referred to the Reference Committee on Report of the Malpractice Insurance and Defense Board and Report of the Legal Counsel, of which Dr Abraham Koplowitz is chairman

Section 66 (*See 141*)

Proposal to Create a Committee on Emergency Preparedness

DR WALTER P ANDERTON, *Secretary* Mr Speaker, as a result of a communication to the Society from the American Medical Association, and as a result of Dr Lull's and Dr Engel's speeches this morning, I move that the President be empowered to appoint a Committee on Emergency Preparedness

DR HARRY ARANOW, *Councilor* I second the motion

SPEAKER ANDRESEN That will have to be referred to a Reference Committee, I believe

SECRETARY ANDERTON I take the liberty of suggesting that this long and arduous motion could be voted on immediately and not necessarily referred to a reference committee

SPEAKER ANDRESEN I am informed that the President's Report contained a recommendation to that effect Therefore, I would like to refer that motion also to the Reference Committee on Report of the President, of which Dr Phillip D Allen is chairman

Section 67 (*See 162*)

Isotope Committee

DR LAURANCE D REDWAY, *Literary Editor* I would like to introduce a resolution in behalf of myself and Dr Norman S Moore, of Ithaca, on the subject of an Isotope Committee

"WHEREAS, the policy of the United States Atomic Energy Commission is liberal with respect to the relation of radioactive isotopes for research in general, and

"WHEREAS, consequent upon this farsighted policy of the Commission many more radioactive materials will be handled by an increasing number of people, and

"WHEREAS, the danger to technical personnel and the public through carelessness or lack of uniform protective measures in dealing with these materials will increase, and

"WHEREAS, in the event of the emergency of mass radiation immediate protective measures would be imperative, now be it

"*Resolved*, that the Medical Society of the State of New York, acting in the public interest, instruct its Council to create an isotope committee for the purpose of coordinating the protective measures now being formulated by various scientific, medical, public health, and industrial groups, and through the educational channels of the Society familiarize the physicians of the State with all known protective measures applicable to peacetime uses of radioactive materials"

SPEAKER ANDRESEN Referred to the Reference Committee on Report of Council, Part V, of which Dr Philip L Forster is chairman

Section 68 (*See 166*)
Insurance Forms

DR. CHARLES GULLO *Livingston* I submit this resolution for the Livingston County Medical Society, which was passed on March 24 of this year It has reference to Insurance Forms

"WHEREAS, physicians are asked to make out many illness and mortality forms of insurance companies and

'WHEREAS the filling of such forms often requires considerable time, and

"WHEREAS those forms are generally never alike, be it

' *Resolved* that the Council appoint a committee to meet with a committee of the Association of Life Insurance Companies for the purpose of standardizing the illness and mortality forms and thereby make them more brief'

SPEAKER ANDRESEN Referred to Reference Committee on Report of the Council, Part VI, of which Dr Edward P Flood is chairman

Section 69 (*See 170*)
Draft of Physicians

DR. B M. BERNSTEIN, *Kings* This resolution has been inspired by the editorial appearing in the *Journal of the American Medical Association* and which I saw yesterday morning

' WHEREAS, the medical profession always has taken, and always will unselfishly take its part in any national emergency, and

' WHEREAS, it would appear that the passage of draft legislation by the Congress is imminent, and

"WHEREAS, indications are that an attempt will be made to adopt a different age differential for physicians from that to be advised for the rest of the available population, and

"WHEREAS, it would appear that an adequate pool of physicians already exists from amongst those educated under government student programs during the last war and as yet not called for duty and from those deferred for a variety of reasons during the last war, and from amongst those now completing or who will complete internships during the next two years, and from those who will volunteer their services, even though not of draft age therefore be it

' *Resolved* that such a differential in age of those eligible for draft would be discriminatory, unnecessary, undemocratic, and contrary to the principles of our Constitution and be it further

' *Resolved*, that the proper committees of the House, Senate, and the presiding officers of those bodies and the Secretary of National Defense and the Secretary of the Army Navy and Public Health Service, and the President of the United States be so advised by the endorsement of this resolution at this session of the House of Delegates and be it further

' *Resolved*, that the Chairman of the National Security Resources Board and the Secretary of National Defense be urged to sanction the creation of a Civilian Medical Board to aid in obtaining the necessary medical personnel which would be required under a selective service draft act and be it further

"*Resolved*, that the Secretary be instructed to transmit these resolutions to the above-named authorities without delay

SPEAKER ANDRESEN Referred to Reference Committee on Miscellaneous Business B, of which Dr William B Rawls is chairman

Are there any further resolutions?

There was no response.

SPEAKER ANDRESEN If there are no other resolutions, we will go on to the reference committee reports The reference committees worked very long and hard yesterday Some of them were still working at five and six o clock Some met in the evening to complete their reports I hope that all of the objectants and all of the proponents of the various proposals that were referred to these committees numbering 38 yesterday have thoroughly discussed their positions, and their various points of view have been reconciled, so we won t need to spend too much time today on them.

We are now ready for the Reference Committee Reports.

Section 70
Report of Reference Committee on the Report of the Secretary

DR. LEO F SCHIFF *Clinton* The report of the Secretary contains membership statistics information relative to the *Medical Directory* and the JOURNAL, some comment on the activities of the Council, and other interesting information relative to his personal activities.

We note a net increase of 779 members, and a death rate among the membership of slightly more than 1.2 per cent. We are interested to know the reasons underlying the resignation of 420 members, slightly more than 2 per cent of our membership

The number of honor counties dropped from 25 in 1947 to 20 in 1948

Appointment of members of this Society to various State Boards and Commissions during the past year are duly noted in the Secretary's report. Certain other activities of the Council are commented upon in the report, but none of these in such a way as to require any action by the House of Delegates such matters coming under the Report of the Council

Under Comments are listed the various meetings which our Secretary has attended including Council and Board of Trustee meetings, as well as seven of the eight district branch meetings and various hearings and conferences. We appreciate that these meetings, casually listed in less than half a column of the report, must have taken considerable of our Secretary's time

We are particularly pleased that our Secretary has been able to assist a number of physicians to find locations for practice and enjoyed as part of his vacation visiting several rural locations whence had come requests for physicians

Our Secretary reports the death on October 10, 1947, of Dr Frederic E. Sondern, Past President of our Society, of which due notice was taken at the opening session yesterday

We are pleased to note the appreciation expressed by our Secretary for the cooperation and consideration shown him by his fellow officers, the councilors, trustees, and members of the staff of the Medical Society of the State of New York We feel his own amiability alert mentality and willingness to work for the good of our Society well deserve such consideration and cooperation.

There are no recommendations in this part of the report, and I move its adoption

DR. MOSES H KNAKOW *Bronx*. I second the motion.

There being no discussion, the motion was put to a vote and was unanimously carried

Section 71

Report of Reference Committee on Reports of District Branches

DR LEO F SCHIFF, *Clinton* As regards the reports of the district branches, these show that each of the eight district branches held an annual meeting, most of them in the fall of the year The meetings consisted of one-day sessions either morning and afternoon or afternoon and evening, and all were attended by our President, Dr Bauer, accompanied by other officials and members of the staff of the State Society Attendance varied from 69 to 201 Programs included formal papers, symposia, panel discussions, and clinics In addition to scientific subjects, various matters having to do with the economic and administrative aspects of the medical profession were presented and discussed

The president of the First District Branch raises the question of the usefulness of branch meetings, at least in the metropolitan area

Since this is the only branch to raise such a question, your Reference Committee recommends that no action be taken in the matter at the present time

May I also say that I understand that the Reference Committee on the Report of the Planning Committee for Medical Policies had this matter under consideration from another angle, so that I do not believe any action is necessary so far as the consideration of the Report of the District Branches is concerned

On the other side of the picture the Eighth District Branch has formed an Advisory Council of presidents and secretaries of the medical societies composing that branch. This Advisory Council has just completed its first year of activity and has met at intervals of two months to consider bills before the State Legislature and to carry on correspondence with various State legislators sponsoring or interested in certain bills It is reported that all meetings have been well attended, and the discussion has been free The last meeting, held on February 12, 1948, included also representatives of the Legislation and Workmen's Compensation Committees of the component counties Among other things done, it was agreed that at future meetings representatives from various county society committees should meet with the Advisory Council to share opinions and to act in concert on matters that might pertain to their respective committees

This we feel is a most commendable plan a step forward in the harmonious working of the component parts of an organized medical group such as ours, and we recommend it for serious consideration by other district branches

I would like to say also that I believe that this particular phase of our activity has been under consideration by the Reference Committee on Report of the Planning Committee for Medical Policies and that you may hear more definite recommendations from them than we are making in our consideration merely of the reports of the presidents of the district branches

Mr Speaker, I move the adoption of this portion of the report

DR HARRY ARANOW, *Councilor* I second the motion

SPEAKER ANDRESEN This involves two parts, doesn't it, the one to disregard the suggestion that the district branches be abolished, and the other one telling what a district branch can do, and commending the branch for it Is that right?

DR SCHIFF Yes

SPEAKER ANDRESEN Is there any discussion on the motion to adopt this portion of the report?

The question was called, and the motion was put to a vote and was unanimously carried

Section 72

Report of the Reference Committee on Report of Censors

DR LEO F SCHIFF, *Clinton* We are informed by the Secretary of the Society that it has not been necessary for the Censors to hold a meeting during the past year as no business came up for them to act upon We congratulate the Society on having passed through another year without need for the services of the Board of Censors

I move the adoption of this portion of the report

DR FREDERICK S WETHERELL, *Onondaga* I second the motion

There being no discussion, the motion was put to a vote and was unanimously carried

Section 73 (*See 40*)

Report of Reference Committee on Report of Secretary Changing Chest Session to Section

DR LEO F SCHIFF, *Clinton* Reporting on the resolution that the House referred to your Reference Committee presented by Dr Gaffney, of Oneida, and actually discussed in the Secretary's report but omitted in our report on the Secretary's report, because it was going to be presented in the form of this resolution, on the matter of changing the Chest Session to a Chest Section,

"WHEREAS, interest in chest diseases is great as evidenced by large attendance at programs of the Session on Chest Diseases, and

"WHEREAS, great advances are currently being made in the diagnosis and treatment of chest diseases, and

"WHEREAS, more program time is required to present adequately these advances to the profession, therefore be it

"*Resolved*, that the *Session* on Chest Diseases be made a *Section* on Chest Diseases"

This matter was recorded in the report of the Secretary as having been taken up by the Council on November 13, 1947, which voted to recommend that a Section on Chest Diseases be created

Your Reference Committee recommends that such action be approved As you known, this would entitle them to Section Officers and to hold two meetings during our Annual Meeting instead of the one session

I move the adoption of this portion of the report

DR EDWARD A GRIFFIN, *Kings* I second the motion

There being no discussion, the motion was put to a vote and was carried

DR SCHIFF Now I move the adoption of the report of this Reference Committee as a whole

DR JOSEPH A GEIS, *Essex* I second the motion

There being no discussion, the motion was put to a vote, and was carried

SPEAKER ANDRESEN The report is adopted as a whole, and we thank you, Dr Schiff

Are there any other Reference Committees ready to report?

Section 74

Report of Reference Committee on Report of Council, Part XII Medical Licensure

DR JOSEPH A GEIS, *Essex* Your Reference

Committee has noted the statistics quoted in the report of the Council Committee on Medical Licensure and wishes to draw to the attention of this House of Delegates the fact that, despite the propaganda of the state medicine adherents the increase in the number of doctors has not lagged behind the population growth

We also note that the special regulation regarding credit for armed service applies only to those who began service prior to January 1 1947 Soon this will automatically cancel itself

We note with alarm the report that the Education Department expects a large influx of foreign physicians, especially because of the following words in the report

> We understand that it is the policy of the Department of Education of the State of New York that they will not endorse any foreign medical graduate, nor will they admit to medical licensure examination any foreign graduate who has matriculated in medicine after January 1, 1940 "

We agree with the Council Committee that this is sound and sensible but feel that we should know that this is so and not just understand it We agree thoroughly that all foreign applicants must be examined

Inasmuch as our Education Department is questioning the value of the medical education of foreign schools, strong representations should be made to the Veterans Bureau so that they stop their recognition of these schools for veterans' education

We also note that while chiropractors are not and should not be, licensed in this State that the Veterans Administration is paying for this so-called education under the G I Bill of Rights. We greatly fear that this will end in a greater demand for their licensure with the added argument of sympathy for the veterans An attempt should be made to stop this

We also agree with the use of injunction proceedings against illegal practitioners

I move the adoption of this section of the report.

Dr. Peter J Di Natale *Genesee* I second it.

There being no discussion the motion was put to a vote and was unanimously carried.

Section 75

Report of Reference Committee on Report of Council, Part XII Report of Special Committee on Office Administration and Policies

Dr Joseph A Geis *Essex* Your Reference Committee read with approval the report of the Special Committee on Office Administration and Policies. We approve the removal of the offices so that they are all on one floor We especially approve the provisions for annual physical examination of employes Most assuredly we must practice what we preach

We approve the improvements in office routine and feel that these will lead to a marked increase in efficiency Because your Special Committee has put into effect so many improvements in the past year we agree with the report that, for the time being it is unnecessary to spend the money for a survey by outsiders

The Society owes its thanks to this hardworking committee We recommend that this committee be continued I move the approval of this part of the report.

Dr. Harry Aranow *Councilor* I second it.

There being no discussion the motion was put to a vote and was unanimously carried.

Section 76 (See 110)

Report of Reference Committee on Report of Council Part XII Nursing Education

After considerable discussion, was referred back to Reference Committee.

Section 77 (See 27 80)

Report of Reference Committee on Report of Council, Part XII Woman's Auxiliary

Dr. Joseph A Geis, *Essex* Your Reference Committee notes with considerable pleasure the large amount of work done during the past year by the Woman's Auxiliary This has grown so fast and has taken so many burdens from the officers and members of the Society that it is a never-ceasing surprise The *Distaff* has become an important publication to the aims of this Society

How Mrs Pohlmann was able to get to so many sections of the State during one short year is something that your Reference Committee cannot understand It certainly looks as if being president of the Auxiliary is a full time job

This House of Delegates should send a letter of appreciation and thanks for their work

We recommend to the Council that they recommend to the Board of Trustees that the appropriation be increased by $1 000

We worded that last phrase very carefully for fear we would get a rise out of Dr Rooney We wanted to save the time of this House as much as possible.

I move the adoption of that portion of the report

Dr. Frederick S Wetherell, *Onondaga* I second it.

There being no discussion, the motion was put to a vote and was unanimously carried

Section 78

Report of Reference Committee on Report of Council, Part XII Report of Convention Committee

Dr Joseph A. Geis, *Essex* Your Reference Committee wishes to thank the Council Committee on Convention for its difficult work at the last convention

Now that the war is over, we suggest that arrangements be made for tables for the delegates while at the meeting While we had to put up with inconveniences then, it was difficult to take notes, check the program, and hold a cigarette at the same time.

We also recommend that where possible the sessions be held in the headquarters hotel.

We thoroughly approve the presentation of certificates to the fifty year members and recommend that this be made an annual event

We especially feel that the thanks of this House is due to those members and employes of the Society who adopted mops, brooms, etc., at 3 00 A.M to get ready for the opening of the convention Their modesty in not making this a part of their report should not be overlooked.

I move the adoption of this section of the report

Dr. Edwin A. Griffin *Kings* According to the strict sense of the word the war is not yet over It has not yet been declared over

Dr. Geis I would say that I think it is sufficiently over so that we could get tables to put our papers on while we are at this meeting

Dr. Frederick W Williams, *Bronx*. In addition may I also suggest to this Reference Committee that they suggest to the Speaker of the House that on the opening day when he is calling for resolutions an easy orderly way to do that would be to call the

counties in alphabetical order as to whether they have resolutions, rather than have this scramble that we had yesterday morning, "Call me," "Call me," "Call me"

SPEAKER ANDRESEN The Speaker will take that under advisement Thank you

Has that motion for the adoption of that portion of the Reference Committee's report been seconded?

DR ALFRED M HELLMAN, *New York* I will second it

There being no discussion, the motion was put to a vote and was unanimously carried

Section 79 (*See 131*)

Report of Reference Committee on Report of Council, Part XII Report of Committee on Questions on Ethics

DR JOSEPH A GEIS, *Essex* Your Reference Committee agrees with the Council Committee on Questions on Ethics that Section 31(b), Principles of Professional Conduct, adopted at the last meeting of the House of Delegates, was ill advised, and that it be rescinded.

We also believe that the proposed substitute is also improper, ill advised, and poorly worded We recommend that it be not adopted

We recommend that the Council give this further study

CHORUS What is it all about?

DR GEIS Section 31(b), Principles of Professional Conduct, that was adopted last year reads

Publications for the Laity

"Members of this Society who have prepared and written a book, article, or any writing pertaining to medicine, for the laity and intended for publication, shall submit the same to the Council Committee on Public Relations and the Public Relations Bureau of the Medical Society of the State of New York for approval prior to any publication thereof In the event the book, article, or writing shall be so approved for publication, then and in that event any proposed advertisement for or announcement of publication thereof shall be likewise submitted to said Council Committee and Bureau for approval prior to any appearance thereof in print The reviewing committee shall render its opinion without unnecessary delay This committee shall be in the main guided by Section 31 of the 'Principles of Professional Conduct' but shall be empowered to make such concessions as may be practiced and necessary in considering the title of the publication, the description of the content, the responsibility, standing, and reputation of the writer and such other material through which the publisher wishes to arouse reader interest"

That is the one that the Council in its report recommended be rescinded, and that is the report that was adopted last year in Buffalo That is the one that your Reference Committee also recommends be rescinded

The Committee suggests to insert in its place the following, I mean, now, the Council Committee

"Advertisements and Announcements of Publications for the Laity

"In the event that there is proposed any public announcement of or advertising in relation to any book or article or writing for the laity, such proposed announcement or advertising matter shall be submitted to the Council Committee on Public Relations prior to any public appearance of the announcement or advertising matter This reviewing committee shall render its opinion without unnecessary delay It shall be guided mainly by Section 31 of these Principles of Professional Conduct, but shall be empowered to make such concessions as may be practiced and necessary, in considering the description of the title and contents of the publication, the professional standing and reputation of the author, and such other material through which the publisher may wish to arouse interest"

We recommend that that last that I read not be adopted, but that it be referred back to the Council for further study I so move

DR AARON KOTTLER, *Kings* I second the motion

PRESIDENT BAUER As I understand it, this Reference Committee is recommending that the present article in the Code of Ethics be rescinded and that this substitute be referred back Is that correct?

DR GEIS That is correct

PRESIDENT BAUER Gentlemen of the House, the article certainly should be rescinded in my opinion That article was adopted last year I don't know why it ever was adopted because it is a violation of the Constitution of the United States on free speech

CHORUS Why?

PRESIDENT BAUER You cannot possibly dictate to a man what he can write or what he shall say

DR FREDERICK W WILLIAMS, *Bronx* But cannot the members of the Society discipline themselves? We are not dictating to nonmembers

PRESIDENT BAUER The members of the Society can discipline another member if he does anything unethical, but to say he cannot either write or speak without having it approved by a committee of this Society I certainly think is going just a little bit too far I don't think we have any right to do it It ought to be rescinded

DR WILLIAMS We feel that this is not a violation of the Constitution but that it is purely a matter of discipline and controlling the ethics of the members of the Society If you will remember, the cause for the introduction of this particular provision last year was the trial or appeal we had by a man who was brought up before the Board of Censors for just such an incident Because of that incident, we brought in that article, and it influenced our judgment in passing it On behalf of Bronx County, I wish to say we are in favor of retaining what was passed last year

DR BENJAMIN M BERNSTEIN, *Kings* Mr Speaker and Gentlemen, if we are going to adopt a resolution of any kind whereby we seek to censor stuff that goes into print, how about the men who get on the radio and about the men who are going to be sent out by speakers' bureaus to talk to lay organizations day after day? Who is going to censor them? How are we going to determine in advance what a man is going to say when he leaves our headquarters to talk about anything under the sun, whether it be socialized medicine, the treatment of cancer, or what have you?

It seems rather foolish to try and stop a man from writing certain things by first sending it to a committee who shall have the final say whether his stuff is worth while reading or not, yet permitting these men at will to get on the radio—and we have done it for years—to talk about anything we want them to without being able to stop them

DR RENATO J AZZARI, *Bronx* I want to say for Bronx County that we censor everything that is written for or said over the radio first before it is presented

SECRETARY ANDERTON May I inquire from the Chairman of the Reference Committee the reasons why the Reference Committee recommends that the proposed new article not be accepted?

DR. GEIS I might answer Dr Anderton on that by saying that the Reference Committee was unable—maybe it is our ignorance—but we were unable to get any real meaning out of it That is the reason we referred it back to the Council for further study

SPEAKER ANDRESEN Any further discussion? [ ]

DR. JAMES F REULING *Treasurer* Mr Speaker, as chairman of this Committee on Questions of Ethics, I certainly feel that the amendment as adopted last year should be withdrawn I believe the Reference Committee s report should probably be broken down into two parts First, their recommendation that that amendment adopted last year be rescinded If you will consider that carefully it means that if I or any member of this House or any member of the Society write any article or get up and make a speech before a lay body, for example if you are going to talk before a parent teacher's association you must first have that cleared by the Council Committee on Public Relations and the Public Relations Bureau. I think that should be repealed, and I would suggest, Mr Speaker that we divide this into two sections. I would offer a substitute motion for the Reference Committee s report that Section 31(b), "Publications for the Laity, as adopted by the House of Delegates last year be rescinded.

DR. GEIS Without the necessity for a vote the Reference Committee will accept that substitution which will have the effect of voting on these separately

DR. REULING Yes.

SPEAKER ANDRESEN The Chair intended to present it that way First there will be the motion to rescind, and then the motion to approve the referral. I don t think we require any particular motion to do that but we can continue the discussion for a moment more Dr Geis was asked to discuss the reason for having turned down the suggestion of the Council Committee, and he said that he could not make any sense out of it. Does anybody here have anything further to say about that?

DR. WILLIAMS If I may speak again and this is only a brief statement we are not censoring what the man publishes we are only checking it for his ethics I think that is a misumpression given by the men of the opposition

SPEAKER ANDRESEN If there is no further discussion we will go on to the motion to rescind. In view of the fact that this recommendation was made a month in advance, we only require a majority to rescind If it had not been made a month in advance, we would require a two-thirds vote All in favor of rescinding last year s action as recommended by the Council Committee and by the Reference Committee say Aye contrary 'Nay It is declared rescinded

We now come to the second half of the recommendation of the Council Committee in regard to this matter to the Council to report back next year We have had discussion, so all in favor of this say Aye ' contrary Nay It is referred back

DR. GEIS If I may make a suggestion, and if I am out of order say so now that we have repealed 31(b) as adopted and have not adopted the new proposal, is it in order to make a motion that we go back to 31(b) as it was previous to last year so that there is something in the Code of Ethics to cover such a situation? I will ask for your ruling on that.

SPEAKER ANDRESEN I don't see any reason why you could not make a motion to that effect, and I would so rule That would cover us temporarily until the Council reported

DR EZRA A. WOLFF, *Queens* Are we not automatically covered because last year s action rescinded the previous article and put in its place the present one we have now repealed? Therefore our status is as it was before last year's meeting

CHORUS No

DR GEIS We have nothing now

SPEAKER ANDRESEN According to information I have now received it was not amended but it was an addition.

DR. GEIS This motion just passed has rescinded Section 31(b) but does not reinstate anything

SPEAKER ANDRESEN That leaves no provision for that particular thing in our Principles of Professional Conduct.

SECRETARY ANDERTON I think perhaps I can clear the matter up Last year there was an addition passed to Section 31(b) You have now rescinded that addition, which leaves 31(b) the way it was before the action last year

SPEAKER ANDRESEN We will accept that There will be no need for any such motion then Dr Geis.

DR. GEIS I now move the adoption of this report as a whole with the exception of the part on Nursing Education, which the Committee has to reconsider

DR. SAMUEL Z FREEDMAN, *New York* I second the motion.

There being no discussion the motion was put to a vote and was unanimously carried

Section 80 (*See 87, 77*)

Report of Reference Committee on Report of Council, Part XII Woman's Auxiliary

DR. JOSEPH A. GEIS, *Essex* Mr Speaker on a resolution introduced by Dr Beckman, of New York on the Woman s Auxiliary, reading

'WHEREAS, both by word of mouth and in the press we are increasingly made aware of the fine work that the Woman's Auxiliary to the Medical Society of the State of New York is accomplishing in the fields of economics, legislation, public relations and development of good will among our fellow physicians, both on a State and county level now therefore be it

Resolved, that the House of Delegates extend a vote of thanks to the officers and members of the Auxiliary, and recommend that the officers of the State Society and every constituent county society be advised that it is the sentiment of this House that whatever time energy or money that may be used in promotion of the work of this Auxiliary is well invested

We approve of this resolution although it is covered by Report of the Reference Committee on Report of Council Part XII on the Woman s Auxiliary

I move the adoption of this portion of the report.

DR EZRA A. WOLFF *Queens* I second it.

There being no discussion the motion was put to a vote and was unanimously carried.

Section 81 (*See 52*)

Report of Reference Committee on Report of Council, Part XII: Specialty Boards

DR. JOSEPH A. GEIS, *Essex*. Reporting on the resolution introduced by Dr Galluccio on Specialty Boards, reading

"WHEREAS, it has always been the admitted aim of the American Medical Association to encourage hospital affiliations for all physicians, and

"WHEREAS, many hospitals are taking restrictive measures with respect to staff appointments and promotions in order to satisfy requirements established by Specialty Boards, and

"WHEREAS, these requirements of the numerous self-appointed and self-perpetuating Specialty Boards are often arbitrary, variable, and discriminatory, and

"WHEREAS, the accepted method of granting license to practice medicine and surgery is reserved to the various states, and the right to practice a specialty, being a logical extension of this method, should be state-controlled by standards set up through the various state societies and their components, and

"WHEREAS, it has been accepted as a first principle in the administration of American justice that a man be judged by a jury of his peers drawn from his local community, and

"WHEREAS, the Council on Medical Education and Hospitals of the American Medical Association with the concurrence of the Advisory Board for Medical Specialties has stated that

'Hospital staff appointments should depend on the qualifications of physicians to render proper care to hospitalized patients as judged by the professional staff of the hospital and not on certification or special society membership',

and

"WHEREAS, this entire problem presents a challenge to the ability of the American Medical Association to regulate itself with justice to all members and to advance the cause of Public Health and Welfare through the improvement of medical standards, therefore be it

"*Resolved*, that the Bronx County Medical Society through its Delegates request the Medical Society of the State of New York to take measures to arrest and correct this inequitable situation until such time as means may be found to place certification of specialists on a more reasonable, democratic, and local basis, and be it further

"*Resolved*, that failing to obtain cooperation from the various Specialty Boards and hospitals the American Medical Association be requested to withhold recognition from hospitals which make certification by a Specialty Board a necessary qualification for appointment or promotion on a hospital staff, and be it further

"*Resolved*, that the Delegates of the New York State Medical Society to the American Medical Association Convention be instructed to place these resolutions before the 1948 House of Delegates of the American Medical Association"

We approve this resolution We feel that a background of general practice before entering a specialty field is most necessary I so move

DR WILLIAM KLEIN, *Bronx* I second it

There being no discussion, the motion was put to a vote and was carried

Section 82

Reference Committee on Report of Council, Part VII Medical Care Insurance

DR JOHN B D'ALBORA, *Second District Branch* Your Reference Committee reviewed the report of the Subcommittee on Medical Care Insurance and wishes to compliment the Subcommittee for the work they accomplished and the comprehensive progress report they presented

Your Reference Committee recommends approval of the recommendations of the Committee, commending the participating physicians of the Western New York Medical Plan, Buffalo, for the commendable working out of their difficult problem of their general medical coverage contract Your Reference Committee is of the opinion that, because of increasing actuarial experience, this type of contract can be satisfactorily developed under adequate safeguards The subscribing public is showing considerable interest in this form of comprehensive medical coverage contract, and we must solve this problem of good medical care for the public

Your Reference Committee recommends that the Subcommittee on Medical Expense Insurance, the Director of the Bureau of Medical Care Insurance, and the New York State Medical Expense Plans continue to study this problem and strive to arrive at a satisfactory solution as soon as possible

I move we adopt this part of the report

DR PETER M MURRAY, *New York* I second the motion

There being no discussion, the motion was put to a vote and was unanimously carried

DR D'ALBORA Your Reference Committee approves the recommendation of the Committee in the matter of affiliation of the plans in Associated Medical Care Plans, Inc , under the direction of Dr Paul Hawley It is a desirable step in the right direction, for only through such a nation-wide organization will the necessary knowledge and experience become available to the mutual advantage of all plans

I move we adopt this part of the report

DR RENATO J AZZARI, *Bronx* I second the motion

There being no discussion, the motion was put to a vote and was unanimously carried

DR D'ALBORA Your Reference Committee recommends that the Committee and the Director of the Bureau of Medical Care Insurance continue the study of the problem of uniform contracts on a State level We believe the ultimate attainment of uniform contracts on a State level is desirable and will be to the advantage of all concerned We believe that a uniform contract providing surgical, in-hospital medical care should be considered on a State-wide basis as soon as it is possible

Your Reference Committee recommends approval of the action of the Committee in instructing the Director of the Bureau of Medical Care Insurance to survey groups of doctors and subscribers in each plan to determine reactions to and experience in the plans The compilation of this information will be helpful to the Committee in suggesting improvements to the various plans

I move approval of this part of the report

DR HARRY ARANOW, *Councilor* I second the motion

There being no discussion, the motion was put to a vote and was unanimously carried

DR D'ALBORA Your Reference Committee recommends approval of the action of the Committee in instructing the Director of the Bureau of Medical Care Insurance to survey county medical societies in regard to approval of the plan in each operating area The reactions of the various county medical societies to the plan will prove instructive and helpful to the Committee in reporting the results of this survey to the House of Delegates at our next annual meeting

I move approval of this part of the report.

DR. PETER J DI NATALE, *Genesee* I second it.

There being no discussion the motion was put to a vote and was unanimously carried

DR. D ALBORA Your Reference Committee recommends approval of the action of the Committee to publicize medical care plans locally through county society publications by inviting their cooperation to give desirable space to the plans operating in each area, copy to be furnished by local plans and where needed, supplemented by the Bureau of Medical Care Insurance from the State level

I move approval of this part of the report

DR. WILLIAM B RAWLS, *New York* I second the motion

There being no discussion the motion was put to a vote and was unanimously carried

DR. D ALBORA Your Reference Committee recommends approval of the action of the Committee in the development of an informative folder for periodic distribution to doctors, cost to be carried by each plan in proportion to the number desired

I move approval of this part of the report

DR A W MARTIN MARINO *Kings* I second it

There being no discussion the motion was put to a vote and was unanimously carried.

DR. D ALBORA Your Reference Committee recommends approval of the action of the Committee in recommending through the Council Committee on Economics that the Medical Society of the State of New York extend continued approval of the six New York State plans for another year as follows United Medical Service, Inc. Genesee Valley Medical Care, Inc Central New York Medical Plan, Medical and Surgical Care Inc., Northeastern New York Medical Service and Western New York Medical Plan

I move approval of this part of the report.

DR. IRWIN E SIRIS, *Kings* I second the motion

There being no discussion the motion was put to a vote and was unanimously carried

DR. D ALBORA Your Reference Committee wishes to call to the attention of this House of Delegates the phenomenal progress made by the New York State plans during the past year It is far beyond the dreams and expectations of many of us when these plans were first organized

Your Reference Committee recommends a vote of thanks and appreciation to the Director of the Bureau of Medical Care Insurance, Mr George P Farrell, for the comprehensive report of his activities during the past year and to wish him continued progress and success in his assignment.

Your Reference Committee recommends a vote of thanks and appreciation to the Subcommittee of Medical Care Insurance Dr Aaron, the chairman and the members of this Committee have shown a profound knowledge and understanding of the problem of medical expense insurance and have met all issues squarely and efficiently

I move approval of this part of the report

DR. A. WILBUR DURYEE, *New York* I second the motion

There being no discussion the motion was put to a vote and was unanimously carried

DR. D ALBORA Now I move approval of the report in full.

DR. JOSEPH A GEIS *Essex* I second it.

There being no discussion the motion was put to a vote and was unanimously carried

Section 83 (*See 25*)

Report of Reference Committee on Report of Council Part VII Voluntary Insurance by the American Medical Association

DR. JOHN B D ALBORA, *District Delegate* On the resolution introduced by Dr Alfred M Hellman of New York County on Voluntary Insurance by the American Medical Association reading

"WHEREAS it has come to the attention of the medical profession that the American Medical Association is insuring its employes in a commercial company for hospitalization rather than in the Blue Cross Plan and

WHEREAS, this is contrary to the advice given by physicians to their patients and to employe groups and

WHEREAS, this is definitely against the best interests of the medical profession and the patients of the medical profession and

WHEREAS, this is a step that would tend towards compulsory health insurance rather than towards voluntary health insurance, therefore be it

Resolved that the House of Delegates of the Medical Society of the State of New York at its annual meeting May 1948 protest against this method of insuring and instruct its delegates to the American Medical Association to make every effort to have the American Medical Association insure its employes through the Blue Cross Plan

your Reference Committee recommends the following resolution in place of the one presented by Dr Hellman

'WHEREAS, it has come to the attention of the medical profession that employes of the American Medical Association accepted insurance in a commercial company for hospitalization rather than in the Blue Cross plan and

'WHEREAS, this is contrary to the advice given by physicians to their patients and to employe groups, and

'WHEREAS, this is definitely against the best interests of the medical profession and the patients of the medical profession therefore be it

Resolved that the House of Delegates of the Medical Society of the State of New York at its annual meeting May 1948 instruct its delegates to the American Medical Association to make every effort to have the American Medical Association in the future insure its employes through the Blue Cross Plan

Mr Speaker I move approval of this substitute resolution presented by your Reference Committee

DR. IRVING J SANDS, *Kings* I second it

DR ALFRED M HELLMAN *New York.* I would just like to say one word There has been no change made in the resolution There has just been one of the whereases left out, and that is quite agreeable to me

PRESIDENT BAUER I think the House should know a little of the background of this The American Medical Association up until 1947 had always insured its employes through a commercial company In 1947 for hospitalization they insured them in the Blue Cross So far as medical care insurance is concerned, there has never been and is not now any voluntary medical care insurance plan available in the State of Illinois There will be one available the first of July because the Chicago Medical Society is starting such a plan, but there was not, and has not been up to the present time one for medical care insurance

When the contract came up for renewal the Blue Cross said they could not guarantee any rate for the

current year A bid was received from this commercial company which was less and had some further provisions than the Blue Cross had These plans were identified as Plans 1 and 2, and in no way did the employes of the Association know which was which The 700 employes were called in, and they were told the details of the two plans They were not told what the plans were except by the number or letter (I don't remember which it was) and the employes, with the exception of the printers, voted overwhelmingly we will say for Plan 2, which turned out to be this commercial plan

The American Medical Association has approved voluntary insurance of both types, both commercial and nonprofit Some of our states in their medical care insurance carry their insurance through a commercial carrier The state of Ohio does I think the state of Wisconsin does, and one or two others, so there is no violation of the principles that the American Medical Association has adopted in giving the insurance to a commercial company It is voluntary just the same as the Blue Cross is voluntary

The Board of Trustees has to decide these things on a business basis and not a sentimental basis For another year, if the Blue Cross can offer a contract which is as good or better than a commercial company's, it will be accepted

The same on medical care insurance If such a plan is available, as it probably will be after July 1, that also would be considered, but I cannot see where we have violated any of the principles which have been adopted by the American Medical Association in letting this contract for one year to a commercial company The employes approved it themselves, and it is within the principles of the American Medical Association adopted in approving different types of voluntary insurance

I don't feel this Society should go on record as protesting the action of the American Medical Association when this was done, as I say, on a purely business basis and not on a sentimental one

SPEAKER ANDRESEN Is there any further discussion? Dr D'Albora, would you like to comment on that?

DR HARRY ARANOW, *Councilor* I think a sentimental basis is a very important basis at times and

CHORUS We cannot hear you

SPEAKER ANDRESEN Dr Aranow, you had better speak from the platform

DR ARANOW I think, while it is true on a business basis the commercial policy might have been advisable, a sentimental basis is also important The majority of men in the medical profession feel that, for the question of a few dollars, the Blue Cross should have been encouraged and that the American Medical Association should have stayed with the Blue Cross That is the information that I have been able to glean from those I have spoken to about it

DR A. WILBUR DURYEE, *New York* Mr Speaker and members of the House, as a member of the Reference Committee I would like to point out that we removed from the original resolution the question of a protest to the American Medical Association This new resolution embodies in it only a recommendation that in the future they seriously consider the voluntary plans, and it is not putting any demand on them I agree with the last speaker that we should encourage support of these plans that are promulgated by the doctors

SPEAKER ANDRESEN Is there any further discussion?

DR ABRAHAM KOPLOWITZ, *Kings* May I discuss this?

SPEAKER ANDRESEN Yes The motion that has been substituted for the original seems quite innocuous I don't think anybody could take offense at it

DR KOPLOWITZ Mr Speaker and members of the House, I am perfectly willing to forget the sentimental side entirely, but as a matter of public relations I think it was a mistake on the part of the American Medical Association to do that The American Medical Association is spending a lot of money on public relations, yet they turn around and make a mistake like that which is going to hurt the Blue Cross with which we have all been approving and working It may cost a little more, but I personally would like to know whether this commercial company has a general policy embodying such prices and such conditions, or whether they made those specially for the American Medical Association for advertising purposes If it is worth that to them, then it is worth to the American Medical Association a lot more not to allow a commercial company to be able to show the country they can get the American Medical Association's employes as against the Blue Cross Plan It was a mistake, and I am in favor of the resolution

SPEAKER ANDRESEN Is there any other discussion?

DR ARTHUR A FISCHL, *Queens* I thought there was one point in the resolution that requires clarification You have a comparison between the voluntary Blue Cross Plan as opposed to the commercial plan The commercial plan is also a voluntary plan I think Dr Bauer brought that out, too From the resolution comparing the Blue Cross, which is a voluntary plan, to a commercial plan, one might logically infer that the commercial plan is not a voluntary plan

DR KOPLOWITZ The term should be "nonprofit plan" rather than "voluntary plan"

CHORUS Right

SPEAKER ANDRESEN Will you comment?

DR D'ALBORA The resolution as the Reference Committee propose it reads as follows

> "WHEREAS, it has come to the attention of the medical profession that employes of the American Medical Association accepted insurance in a commercial company for hospitalization rather than in the Blue Cross Plan, and
>
> "WHEREAS, this is contrary to the advice given by physicians to their patients and to employe groups, and
>
> "WHEREAS, this is definitely against the best interests of the medical profession and the patients of the medical profession, therefore be it
>
> "*Resolved*, that the House of Delegates of the Medical Society of the State of New York at its annual meeting, May, 1948, instruct its delegates to the American Medical Association to make every effort to have the American Medical Association in the future insure its employes through the Blue Cross Plan"

We felt that would take the sting out of Dr Hellman's resolution by omitting one whereas That part of his resolution was

> "WHEREAS, this is a step that would tend towards compulsory health insurance rather than towards voluntary health insurance"

We also modified the latter part of his resolution,

and we felt that that would better meet the idea that Dr Hellman and all of us had that it was bad personnel or public relations on the part of the American Medical Association, but it is done and there is nothing we can do about it now We only hope that in the future it won t happen again

DR. IRVING J SANDS, *Kings* There is one substitution I would suggest For the words "Blue Cross Plan you should substitute ' nonprofit plan because there are others besides the Blue Cross Plans that are voluntary and nonprofit.

SPEAKER ANDRESEN Would you accept that change?

DR. D ALBORA Yes, but I don t see that that would make any difference

DR. SANDS It would antagonize the others to single out the one plan, the Blue Cross Plan.

SPEAKER ANDRESEN Would you want to accept that, or shall we put that to a vote?

DR. D'ALBORA I will accept that on behalf of the Reference Committee

DR. WILLIAM B RAWLS, *New York* I was going to make that suggestion also, Mr Chairman, that we substitute the words nonprofit voluntary health insurance " That would bring in not only hospitalization but everything else

SPEAKER ANDRESEN Dr D'Albora has accepted that change in the substitute resolution on behalf of the Reference Committee

DR. D ALBORA Right

DR. RAWLS I have been very closely associated as most of you know, in this city with voluntary health insurance, and have worked very hard for it. We received a perfect storm of protest here in New York City when this information came out I had at least fifteen clippings cut out of the newspapers and mailed to me by patients to whom I had talked about voluntary health insurance. At every meeting I have attended recently in New York City gentlemen this thing came up I am not censoring anyone I am not out here to do that, but I do want you to know what we received in New York City as a result of this action was plenty and I do think that it did a lot of harm. I had this brought up to me even in a debate the other night in connection with compulsory health insurance where my opponent said, "Even your American Medical Association does not believe in voluntary health insurance

SPEAKER ANDRESEN I believe that every state society in the country will probably pass a similar resolution and we will have quite a storm in Chicago about it

PRESIDENT BAUER I realize there is a lot of criticism about it, but a lot of it was due to a mistake The term used was "voluntary health insurance This is not voluntary health insurance. It is hospital insurance and has nothing to do with medical care insurance at all It also has nothing to do with compulsory health insurance A commercial plan is just as voluntary as a nonprofit plan as far as that is concerned There may be arguments on both sides of the question as to which is the better type of plan, but I don t think it is necessary to go into that now

I also want to call your attention to one thing the employes pay part of it, and they have a right to say what plan they would like to go into They cannot be wholly disregarded

Dr Lull is here in the House, and I would like to ask the privilege of the floor for Dr Lull to speak. He can say more about this than I can as he was more intimately concerned with it.

SPEAKER ANDRESEN All in favor of granting Dr Lull the floor to discuss this subject say "Aye', contrary "Nay'

Dr Lull you are invited to discuss this subject

DR. GEORGE LULL Mr Speaker and Gentlemen, I am not going to get into any argument about whether this was a good thing or not now I am not here to defend the action of the Committee as to whether it was good for public relations or not but I am going to tell you the facts

A year ago the American Medical Association had no medical insurance whatever but had a commercial insurance for hospitalization They have never had anything but a commercial insurance for medical service, and last year they bought hospitalization insurance from the Blue Cross at my insistence to the Committee I said, "Remember that overy thing being equal we should give our hospitalisation to the Blue Cross if possible ' The Committee met and decided to give the Blue Cross the hospital insurance, but they had to purchase commercial medical coverage They still cannot get anything but commercial medical coverage, because the Chicago Medical Plan does not go into effect, they are enrolling now to go into effect the first of July, and the state of Illinois has sponsored a commercial plan, so that as far as any voluntary medical sponsored plans are concerned they are nonexistent If we want the employes insured for medical and surgical coverage, we have to go to a commercial company until the first of next July

I will show you how it works It works this way The Committee was appointed to study where we could get the best coverage. The Committee had submitted to it a number of pieces of mimeographed sheets, with just what we got and what we paid for, and the Committee decided they would pay 50 per cent for their own coverage and the Association pays the other 50 per cent, and that this combination as put out by this commercial insurance company was the best coverage

This price is the standard price put out by the company and was not any policy that was made especially for the American Medical Association.

Now gentlemen, the American Medical Association wants everybody covered with insurance, and they want them covered by voluntary plans whether they are commercial or not This has nothing to do with compulsory sickness insurance, as a matter of fact, enlisting the insurance companies on our side of this battle has probably carried a certain amount of weight in the fight against compulsory sickness insurance

As I say, I am not going to argue as to whether it was a good public relations move or not Probably no one in this room would have known about it except for a lot of publicity given to it by people who desired to get this publicity distributed all over the United States. Messages were sent out to various state organizations about just what had happened as a matter of fact, I will tell you an interesting thing that happened in one state I got nine telegrams as a result of this One telegram was from the president of this midwestern state society who berated the American Medical Association for taking out commercial insurance I replied as I have replied to each one, with a rather lengthy letter telling him just what had happened He wrote me a letter in a few days and said, 'I just got a long letter from you on something about insurance I think you have made a mistake You must have intended it for Dr So-and-so, whose name is similar to mine I am not interested in it.'

So he came into my office a little later on and I

said to him, "Didn't you send me this telegram?" and I showed it to him "Oh, yes, I did allow my name to be used on that telegram, but I had forgotten all about it"

A lot of this controversy was stirred up Whether it was good or not, that made for bad public relations The American Medical Association has no fight or quarrel with the Blue Cross, but on a cold-blooded basis of selecting what the committee of employes thought was best for them, they selected this type of insurance

As I told the Blue Cross man, he never would come near us until after this was done, and then he came over and protested, "All right, next year a committee will meet to decide a month ahead of time just what coverage we will require for next year"

Whereupon he said, "The Blue Cross does not do business that way The Blue Cross either insures you for good or they don't want your business at all"

Of course, there may be another executive there next year, so we may be able to talk differently to him, but that is the story back of it, gentlemen It is too bad that this controversy was stirred up I can assure you that I sat in on the committee meetings The committee is just as much opposed to compulsory sickness insurance, the employes are, as we are The employes have nothing against the Blue Cross except they thought this was better coverage The Medical and Surgical Plan of coverage has always been carried by a commercial carrier and will have to be until next year Next year the Chicago Medical Society will have a plan available

Thank you very much (*Applause*)

SPEAKER ANDRESEN Thank you, Dr Lull!

Is there any further discussion?

The question was called, and the motion was put to a vote and was carried

Section 84 (*See 31*)

Report of Reference Committee on Report of Council, Part VII Doctors' United Medical Service Rates of the United Medical Service

DR JOHN B D'ALBORA, *District Delegate* The Reference Committee had a further resolution presented by Dr Benjamin F Glasser, of Queens County Medical Society, on Doctors' United Medical Service Rates of the United Medical Service The resolution was as follows

"WHEREAS, the United Medical Service operates with the support and approval of the medical profession, and

"WHEREAS, the United Medical Service is underwritten by the medical profession, and

"WHEREAS, under the underwriting plan the United Medical Service can never be financially embarrassed, and

"WHEREAS, rates for a single person of $1,500 and the family rate of $2,500 were related to the workmen's compensation rate, and

"WHEREAS, Workmen's Compensation rates have now proved inadequate, therefore be it

"*Resolved*, that the Medical Society of the State of New York instruct or secure the dissociation of compensation rates on the schedule of United Medical Service"

Your Reference Committee disapproves this resolution for the following reasons

1 It is understood that Workmen's Compensation Rates will be increased by approximately 20 per cent by September 1, 1948

2 Such an increase in compensation rates will permit increases in payments to physicians participating in the United Medical Service Plan

3 That some basic guide must be maintained to assure a sound financial status of the United Medical Service

4 That final authority for increasing benefits rests with the Insurance Department of the State of New York

I move approval of this report

DR HARRY ARANOW, *Councilor* I second it

DR ARTHUR A FISCHL, *Queens* I am sorry I did not know this was going to come up this morning I was going to prepare a little discussion about this

SPEAKER ANDRESEN Will you come up to the front of the room and speak, please?

DR FISCHL There is only one aspect I would like to mention When you talk about rates which the New York State Labor Department allow you, as they do with your workmen's compensation fee schedule, when you try to make some changes in those rates it takes you five, or six, or even ten years to make a change There have been no changes in the Workmen's Compensation Fee Schedule for a number of years The State Society committees have been working very diligently to bring such an increase about We have had resolutions introduced and passed year in and year out trying to change the workmen's compensation fee schedule We are finally succeeding in a very, very minor, perhaps in an almost negligible capacity, to raise those rates It is very, very difficult to have the United Medical Service Fee Schedule based on a fee schedule which is decided upon by the legislative body of New York State I think it is a very unwieldy way of determining what our fee schedule should be for our own insurance company

SPEAKER ANDRESEN Is there any other discussion?

DR BENJAMIN F GLASSER, *Queens* I would just like to say one word in regard to this resolution that I offered It may well be that the wording was not in the best form, but it was hurriedly proposed The intent, however, is quite clear We are attempting to form a service medical organization sponsored and approved by the Medical Society of the State of New York, a voluntary nonprofit organization, and here we hamstring ourselves with State law, State regulation, State bureaucracy, and a form of State control This is not, in principle, voluntary insurance, because when you attach a State rate to a voluntary organization you recognize, whether you like it or not, the fact that you are accepting State control

About the rates themselves, the State has an interest in protecting its rates It has the interest of protecting the employer, the employe and the doctor, and in order to do that they adjust those rates to what figure they think is proper, and as has been said it takes a long time before an insurance company or an employer would permit you to get an increase in rate, therefore, it takes you a long time before you will ever get an increase in the workmen's compensation rates Before you ever succeed, you have to sit down and ask the chairman of the Workman's Compensation Board to give you an increase in rates That may be necessary because the State protects all of its people, but that is not necessary in the United Medical Service When the funds available are not sufficient, the doctor underwrites that insurance He is bound to give them service Therefore, there is no earthly reason why United Medical Service should secure surpluses upon surpluses Regardless of what sized surplus it is, they don't need the money

Gentlemen my purpose here is simply to tell you that it is absolutely unfair to connect up a voluntary insurance plan with a workmen's compensation fee schedule that is regulated by the State It is not flexible It is not feasible It is not necessary

SPEAKER ANDRESEN I have two gentlemen I want to call to speak The first is Dr Arnow who is an expert on legislation in fact, he is the chairman of our Council Committee on Legislation, and then we will next call upon Dr Elliott, who is the founder of all of our medical plans.

DR. HARRY ARANOW *Councilor* I am not speaking as a member of the Legislative Committee but as a member of the Board of Directors of the United Medical Service I was there when it was organized We have been there through all of this time. It is an organization which is entirely controlled by medical men who are out for your interest more than anything else The reason we tied it on to the workmen's compensation fee that was given at that time is because it was higher than any fee that any insurance company paid There is no law about it. We can change it tomorrow We can change it any day we deem it wise to do so It was only a temporary expedient to gauge our fees used largely at that time because, as I said, the workmen s compensation fees were the highest fees that were paid by any insurance company We used those to protect the doctor but there is no law in our Constitution nor any thing in the organization of the United Medical Service that binds us to it. We can change it at any time If Dr Elliott is here, he knows more about it than I do and he will tell you that, too

DR FREDERIC ELLIOTT Mr Speaker and Gentlemen I am very pleased to have this opportunity to clear the misunderstandings which have been given you on this subject At the time that this U M S Plan was organized, it was necessary to establish and file with the Insurance Department a schedule of allowances to be made on claims for services rendered by doctors to our subscribers It was necessary also to establish a rate of charge to the subscriber There was no complete, satisfactory, factual bed either of proposed schedule of allowances, or of proposed rate, or of expectancy of utilization We turned first to the workmen s compensation fee schedule as the best of available data on what factors the doctor should reasonably expect to receive as a minimum compensation or recompense for services rendered to persons in moderate and low income groups.

That schedule at the time we organized had been functioning under the Workmen's Compensation Law of the State of New York for some ten years It had stood the test of time Our actuaries taking that and combining it with the available information from various sources of the expected utilization of our contract calculated a premium rate

At the time U M S asked for and received the sponsorship of the Medical Society of the State of New York, our directors made a commitment to the medical profession that our schedule of allowances would at least conform to the workmen s compensation fee schedule There is nothing in either the Insurance Law or in the Constitution and Bylaws of the United Medical Service which limits us to that minimum We may go as far beyond that as our board of directors and our experience may justify but we may not go below that schedule

At the present time, for your information we are setting in effect a study to go back to at least one thousand dollars within our territory to establish from them factual data on prevailing fees, and we shall undertake to develop a more complete schedule. There is none in existence today from any source and that will be brought back to this House of Delegates a year from now for your considered action

I assure you that this resolution is not clear to me *as to its purpose* If it was written with the idea that we are hamstrung by what any State agency, the workmen's compensation, or labor department, may do, that is not true and it is not necessary to adopt this resolution As I read the resolution, the only thing that it would do would be to release United Medical Service from its prior commitment of at least conforming to the State schedule

I assure you gentlemen that the board of directors of our organization have certain definite things in mind We recognize that the moment we fail to pay one hundred cents on the dollar of our commitments under our contracts we should close up shop The Board is very, very conscious in its determination that we shall at least at all times fulfill the terms of our contract in the payments to doctors Beyond that, we recognize that this is a growing experience. We have accumulated four years of that experience We are now in the process of a careful analysis of that experience, and we shall reconcile three important factors the incidence of claim the receipts that we can receive or obtain in payment for our contracts and allowances for the doctors, and the establishment of reasonably proper reserves to meet any unusual contingency All of this is in the hands of the representatives of this House The board of directors of United Medical Service by its Constitution must have on it at all times a majority of practicing physicians The names of those physicians are submitted to your Council for approval, and in the four years of our existence there has been no time at which there has been the slightest conflict between the lay members of our board and the medical members There is an excellent relationship in mutual confidence, and I am confident in my own mind from daily contact with this whole administration that they are undertaking to serve to the best interests of your public and you, and when we fail to do that we know that we should quit.

Thank you! *(Applause)*

SPEAKER ANDRESEN Members of the House you see why I insisted so yesterday that everybody go to and give his discussion to, the reference committees We are taking up an awful lot of time with discussions this morning that could very well have taken place in the reference committees. If we had the proper confidence in our reference committees, that they had had such meetings and had listened to all of the objectants and all of the proponents, then we would be more free to adopt the recommendations of our Reference Committee and not have such long arguments.

Are there any further questions or discussion? If not, the question will now be put to a vote

CHORUS What is the question?

SPEAKER ANDRESEN Dr D Albora, will you repeat the Reference Committee s recommendation on this resolution?

DR. D ALBORA Your Reference Committee disapproves this resolution for the following reasons

1 It is understood that Workmen s Compensation rates will be increased by approximately 20 per cent by September 1 1948

2 Such an increase in compensation rates will permit increases in payments to physicians participating in the United Medical Service Plan and

3. That some basic guide must be maintained to

assure a sound financial status of the United Medical Service

4 That final authority for increasing benefits rests with the Insurance Department of the State of New York

Mr Speaker, I would say, after listening to Dr Elliott on this subject, we eliminate all of the reasons and just disapprove of the original resolution as presented by Dr Glasser

SPEAKER ANDRESEN You are now substituting another motion for the one that had been proposed, isn't that right?

DR D'ALBORA We disapproved of the resolution

SPEAKER ANDRESEN An affirmative vote disapproves of the resolution introduced by Dr Glasser

The motion was put to a vote and was carried

SPEAKER ANDRESEN The Reference Committee's recommendation is adopted, and the resolution of Dr Glasser is disapproved

Section 85 (*See 5, 6, 7*)

Report of Reference Committee on Report of Board of Trustees and Report of Treasurer

DR IRWIN E SIRIS, *Kings* The Reference Committee has reviewed the Report of the Trustees and that of the Treasurer with the supplementary reports with approval and recommends that they be accepted as presented

It wishes to make the following recommendations pertaining to the publication of the *Directory*

Whereas, the *Directory* that was published cost approximately three times what it had been anticipated, and in view of the fact that the anticipated cost of the new *Directory* is unpredictable due to the high cost of compiling and printing, the Committee recommends that the *Directory* be published once every three years

There are approximately 8,000 doctors in the States of New Jersey and Connecticut who contribute nothing to the compiling of their names in the *Directory* In view of the fact that approximately only 200 copies were sold to physicians in the States of New Jersey and Connecticut, the Committee recommends that the Council consider the advisability of discontinuing the publication in the *Directory* of the names of the physicians residing in the States of New Jersey and Connecticut, until some means can be devised to interest these physicians in defraying some of the cost of compiling their names and their publication in the *Directory*

The Committee wishes to commend the Board of Trustees and the Treasurer for their commendable efforts in behalf of the Society

The Reference Committee moves the adoption of its Report on the Board of Trustees' and Treasurer's Reports

DR HOMER J KNICKERBOCKER, *Ontario* I second the motion

DR JOHN J MASTERSON, *Trustee* I would like to amend that resolution that the *Directory* be published every two years instead of every three years It requires a tremendous amount of work on the part of our office staff to compile this directory We have to train these people, and it takes a long time to train these employes to do this special work If we decide to publish the *Directory* every three years instead of every two, it would mean that these trained people would have to be let out, and then a year before we start the *Directory* again we would have to employ new people at a considerable expense and loss of time, so I would like to amend that so that the *Directory* be published every two years instead of every three

SPEAKER ANDRESEN Will you accept that amendment?

DR SIRIS Yes, I will accept it for the Reference Committee

SPEAKER ANDRESEN The report is amended accordingly, so we won't have to vote on that phase of it

DR JOSEPH A GEIS, *Essex* On this question of discontinuing the listing of New Jersey and Connecticut doctors' names in the *Directory*, before such a step is taken we should find out whether it will make any difference in our advertising rates due to the smaller list of names published That should be seriously considered first as to whether that would cut down the income of the *Directory* through loss of advertising That should be taken into consideration before we decide on eliminating the names of men practicing in our neighboring states

SPEAKER ANDRESEN We will ask Mr Dwight Anderson to enlighten us on this subject He is the one who has charge of it

MR DWIGHT ANDERSON Mr Speaker and members of the House, there are two factors involved in the income on our *Directory* One of them is advertising and the other is volume sales to other than members Last year we increased the price of our *Directory* to others than members from $5 00 to $12 50, and our income increased from $8,000 to $14,000 as a result thereof The people who buy this *Directory* are life insurance companies and other persons who want lists of doctors, addresses, and some information about them Drug houses buy them for the purpose of using them with their detail men It may very possibly be that the absence of the New Jersey and the Connecticut lists would seriously affect the sale of volumes, which is income It might also seriously affect the advertising in the *Directory* It may be that we will wish to dispense with advertising in the *Directory* entirely due to the fact that unfortunately the net from that source is very little Our gross was $21,000, our costs were $13,000, leaving us $8,000, and out of that we had to pay the printing, the paper, and the composition on the advertising pages I have not yet, since the report of the auditors was received, had an opportunity to calculate what our net was, but it is very slight That might be something we would wish to eliminate entirely, selling only the back cover, the end sheets, and those parts of the sections now sold for advertising that we would print anyway You see we buy this expensive coated paper for the whole advertising section of 64 pages, and we are printing with the next issue 25,000 copies, which is a tremendous cost Our cost per page of the *Directory* runs $73 That is the cost of printing and mailing, which is a job The book costs $4 00 As you gentlemen know, if you are buying any popular book, books that used to sell for $2 50 you are now paying $4 00 and $5 00 for, so we cannot be immune to these increased costs

All I wish to say is that I hope you will leave it discretionary with the Committee to make these two decisions and do not decide something by which we might be bound upon a later finding that there was or was not a surplus and advantage to be obtained by something contrary to your decision here today

SPEAKER ANDRESEN Thank you, Mr Anderson! The Reference Committee really only recommends It does not make it mandatory, so that is taken care of

Is there any further discussion?

DR MASTERSON Do I understand then that the elimination of physicians in New Jersey and Con-

necticut and the elimination of advertising is left to the discretion of the Publication Committee?

DR. SIMS To the Council

DR. MASTERSON Directly left to the discretion of the Council?

DR. SIMS Yes.

DR. MASTERSON All right.

The question was called, and the motion was put to a vote and was unanimously carried

Section 86 (*See 88 155*)

Report of Reference Committee on Reports of Board of Trustees and Treasurer Exemption from Dues Payment by Men in Military Service

After discussion, was referred back to Reference Committee

Section 87

Report of Reference Committee on Constitution and Bylaws Proposed Amendments to Article VI of the Constitution and Chapter III, Section 3, of the Bylaws

DR PETER J DI NATALE, *Genesee* This is the report of the Reference Committee on Constitution and Bylaws. I first desire to thank the members of my committee They are Dr Gibson, of Onondaga, Dr Clemans, of Fulton Dr Wolff, of Queens, and Dr Kiley of Saratoga.

I too wish to thank Dr Bauer and all of those who appeared before this committee yesterday afternoon. I am passing out bouquets now the bricks will come later

I want to mention that the American Medical Association at the present time has approximately 130,000 members, and they have nine members on the Board of Trustees.

Your Reference Committee on Constitution and Bylaws has considered the proposed amendments to Article VI of the Constitution and to Chapter III Section 3, of the Bylaws, as introduced by Dr Louis H Bauer President.

The proposed change to Article VI of the Constitution, as proposed by Dr Bauer would make it read

'The Board of Trustees shall consist of nine members elected by the House of Delegates in accordance with the Bylaws The President, Secretary, and Treasurer shall sit with the Board of Trustees with voice but without vote.'

Article VI of the Constitution as it reads at present is

'The Board of Trustees shall consist of five members, elected by the House of Delegates in accordance with the Bylaws The President, the Secretary, and the Treasurer shall sit with the Board of Trustees with voice but without vote

The proposed change to Chapter III Section 3 of the Bylaws, as proposed by Dr Bauer would make it read

'Two trustees shall be elected annually except every fifth year when but one shall be elected each to serve for five years In case of a vacancy a trustee shall be elected for the unexpired term, provided that at the session of the House of Delegates at which this amendment is adopted one trustee shall be elected for five years, one for four years, one for three years, one for two years, and one for one year that at the next four annual sessions, two shall be elected for five years No trustee shall serve for more than two terms, but a trustee elected to serve an unexpired term shall not be regarded as having served a term unless he has served three or more years.

Section 3, of Chapter III of the Bylaws as it reads at present is

One trustee shall be elected annually for a term of five years In the event of a vacancy, a trustee shall be elected for the unexpired term.'

Your committee met with various members of our Society, including Dr Bauer and members of the Board of Trustees, and after considerable discussion and a study of the presentation of information, your committee feels that this proposed amendment be not approved Your committee feels that the Board of Trustees has at present acted well and wisely in handling the financial matters of this Society We further feel that the increase in membership of this Board will not necessarily increase the efficiency of this Board It may and could become unwieldy We also feel that we must protect the financial position of our Society even though this proposed increase would only cost several hundred dollars We feel that it was unwarranted and unnecessary

I move the adoption of the recommendation of the Committee

DR. HARRY ARANOW, *Councilor* I second it.

SPEAKER ANDRESEN The Committee recommends that the changes be disapproved, and that will keep our Board of Trustees at five as it is at present constituted Is there any discussion?

The question was called and the motion was put to a vote and was carried

Section 88 (*See 45*)

Report of Reference Committee on Constitution and Bylaws Enlargement of Council Committee on Workmen's Compensation

DR. PETER J DI NATALE *Genesee* One resolution was referred to us on a proposed amendment to enlarge the Council Committee on Workmen s Compensation introduced by Dr O Gorman of Erie

WHEREAS, the Constitution of the Medical Society of the State of New York limits the membership of the Council Committee on Workmen s Compensation to three, and

WHEREAS there exists a definite need for enlargement of this Committee so as to give it wider representation, now therefore be it

Resolved, that the Constitution of the Medical Society of the State of New York be amended by inserting in Article IV Section 10 thereof after the sentence beginning with 'The membership of Committees' and ending with of the Bylaws' the words and the Committee on Workmen s Compensation (k) Chapter IV Section 9 of the By laws

Your committee was presented with this proposed amendment with regard to the enlargement of the Council Committee on Workmen s Compensation Your committee cannot take any action on this amendment because this is a proposed change in the Constitution and must go through the usual procedure of all such amendments.

I believe that has to lay on the table for one year?

SPEAKER ANDRESEN That is correct

DR. DI NATALE So we took no action on that resolution That completes our report.

SPEAKER ANDRESEN Thank you, Dr Di Natale We have now a question before us as to what we are going to do next It is quite evident that we have a great many reference committee reports still to take up It has been suggested that we adjourn now or in a half hour and then come back at two

o'clock for our executive session My suggestion just now to the people at the table was that we declare a five-minute recess and get a little cooled off and then go on to one o'clock. I am afraid if we don't finish here today we may have to have a night session to complete our work, and most of us would prefer not to do that Does it meet with your approval to do that?

CHORUS Yes

At this point there was a five-minute recess

SPEAKER ANDRESEN We have a few new resolutions to introduce

Section 89 (*See 135*)

Premature Publicity of Medical Matters by State Officers

DR ALFRED ANGRIST, *Queens* I apologize for the lateness of these resolutions, but they are matters that came up in discussion in the committee, and I was asked to present them to you at the earliest possible moment, which is as of now

The first resolution deals with the question of the premature publicity of medical matters by State officers, and I think it will be self-explanatory if I read it

"WHEREAS, it has been the policy of governmental agencies in the past to promote press releases on the expansion of services and the introduction of new programs which involve the physicians of the community, when the cooperation of the local physicians is both desirable and necessary,

"WHEREAS, subsequent discussions for modification of the projected program to render it effective and efficient, improperly place the physicians in the light of obstructing such expansion of services to the public, therefore be it

"*Resolved*, that the Medical Society of the State of New York go on record as advising the interested governmental agencies that the Medical Society of the State of New York is always ready to conduct preliminary discussions about such projects which involve medical service and the allied branches of activity of the government, before press releases are promoted on such matters"

SPEAKER ANDRESEN That will be referred to the Reference Committee on Report of the Council, Part XI, of which Dr Theodore J Curphey is the chairman

Section 90 (*See 136*)

State Expansion of Laboratory and Diagnostic Services

DR ALFRED ANGRIST, *Queens* The second resolution, sir, deals with the projected expansion of State laboratory and diagnostic services I think it will be self-explanatory

"WHEREAS, the question of expansion of diagnostic facilities, including laboratory work, BCG, and x-ray studies is contemplated throughout the City and State of New York, and

"WHEREAS, it is the considered opinion that existing facilities are in need of more adequate staff and funds, therefore be it

"*Resolved*, that the Council state its willingness to appoint representatives familiar with these services, who, together with the Health Departments of the City and State of New York, study the entire problem with a view of adequately staffing existing facilities before considering the expansion of such facilities"

SPEAKER ANDRESEN That is referred to the Reference Committee on Report of Council, Part XI, of which Dr Theodore J Curphey is the Chairman

Section 91 (*See 143*)

Redistricting District Branches

DR STEPHEN R MONTEITH, *Rockland* This concerns the redistricting of District Branches

"WHEREAS, Article 11, Section 3, of the Constitution of the Medical Society of the State of New York states,

'Changes in the number of membership of these district branches may be made by a two-thirds vote of the House of Delegates at any annual meeting',

and

"WHEREAS, the district branches as at present constituted do not include in all instances counties with similar problems in economics and public relations, and

"WHEREAS, the activity of the Eighth District Branch has demonstrated during the past year the organizational value of the district branch, therefore be it

"*Resolved*, that the House of Delegates of the Medical Society of the State of New York refer with power to act to the Council the matter of redistricting the county medical societies into district branches with the creation, if necessary, of a Ninth District Branch"

SPEAKER ANDRESEN That is really a constitutional amendment

DR MONTEITH No

SPEAKER ANDRESEN That is referred to the Reference Committee on Report of Planning Committee for Medical Policies, of which Dr Thomas M *D'Angelo is chairman*

Section 92 (*See 165*)

Practice of Medicine by Hospitals

DR B M BERNSTEIN, *Kings* This resolution deals with the practice of medicine by hospitals

"WHEREAS, there is an increasing tendency on the part of hospitals to employ full-time directors of services in other fields of medicine in addition to those already in operation in radiology, pathology, and anesthesiology, and

"WHEREAS, such a program is a definite threat to the individual and private practice of medicine, and

"WHEREAS, such a plan would appear to place hospitals in the business of practicing medicine, and

"WHEREAS, such a procedure, if left uncontrolled and uncurbed, except in the matter of undergraduate teaching of medical students, might lead to unforeseen difficulties for the practice of medicine, therefore be it

"*Resolved*, that the Council be instructed to set up a special Hospital Relations Committee to study this problem and to use its efforts to prevent hospitals from practicing medicine and interfering with the private practice of medicine and to use all moral and, if necessary, legal methods for this purpose"

SPEAKER ANDRESEN Referred to the Reference Committee on Report of the Council, Part VI, Economics, of which Dr Edward P Flood is chairman

Section 93 (*See 169*)
Automobile Agency

DR. IRVING J SANDS, *Kings* I wish to introduce the following resolution

'WHEREAS it is becoming increasingly difficult for physicians to purchase automobiles, and

WHEREAS, the automobile is a part of the doctor's equipment in his practice of medicine, therefore be it

"*Resolved*, that the Council of the Medical Society of the State of New York be instructed to explore the possibilities of establishing an agency for the purchase of automobiles by doctors"

SPEAKER ANDRESEN Referred to the Reference Committee on Miscellaneous Business A of which Dr Frederick Williams is the chairman

Section 94 (*See 57*)
Report of Reference Committee on Report of Council, Part X Workmen's Compensation. To Amend the Law to Abolish the Medical Practice Committee

DR. FREDERIC W HOLCOMB *Ulster* The first resolution referred to the Reference Committee on the *Report of the Committee on Workmen's Compensation* was introduced by Dr Frank Cerniglia, of Queens reading

'WHEREAS compensation practice in the counties of New York, Brooklyn Bronx and Queens (of over one million population) under the control of the Medical Practice Committee is discriminatory and not conducive to good administration of the Workmen's Compensation Law therefore be it

'*Resolved* that the New York State Medical Society urge the Legislature of the State of New York to amend the Workmen's Compensation Law to abolish the Medical Practice Committee be it further

Resolved, that the support of the county medical societies outside the metropolitan area is urged in order to re-establish a uniform administration of the law throughout New York State.

Your Reference Committee recommends the approval of this resolution and I so move

DR. FREDERICK S WETHERELL, *Onondaga* I second the motion

There being no discussion the motion was put to a vote and was unanimously carried

Section 95 (*See 54*)
Report of Reference Committee on Report of Council, Part X Workmen's Compensation. Fee Schedule

DR. FREDERIC W HOLCOMB, *Ulster* I have another resolution that was referred to your Reference Committee, introduced by Albany County reading

'In view of the long delay in satisfactory revision of the Workmen's Compensation Fee Schedule of the State of New York which has not been materially altered since its establishment, and in view of the greatly increased costs of the practice of medicine during the recent years be it

Resolved, that the Delegates from the Medical Society of the County of Albany be hereby instructed to present to the annual meeting of the House of Delegates of the Medical Society of the State of New York to be held in May 1948, this our protest against the long delayed action of the Workmen's Compensation Board and the State Medical Society which delay has resulted in an unfair financial loss by the physicians of New York State

Your Reference Committee recommends that inasmuch as the Revised Fee Schedule has been changed and will go into effect on September 1, 1948 that no action be taken on this resolution.

It should be pointed out that the function of the State Medical Society is advisory in these negotiations and not administrative or legislative

I move the adoption of the recommendation of the Reference Committee

DR. HARRY ARANOW *Councilor* I second it.

SPEAKER ANDRESEN Approval of the report of the Reference Committee carries with it no action on the resolution Is there any discussion?

The question was called and the motion was put to a vote and was unanimously carried

SPEAKER ANDRESEN No action is taken on the resolution

Have you anything further?

DR HOLCOMB I have the entire report on the Workmen's Compensation Committee if you care to have it now

SPEAKER ANDRESEN Yes.

Section 96
Report of Reference Committee on Report of Council, Part X Workmen's Compensation

DR. FREDERIC W HOLCOMB *Ulster* This is a long report, and if the delegates could follow along their Council Report in this matter, paragraph by paragraph it would be easier to present this because we have tried to summarise and reflect our feeling rather than give you long extracts from each paragraph in other words we are trying to give you the sense of it in our recommendations rather than making this a terrifically long report

I might say too that our Reference Committee did a great deal of work on this and at times we felt somewhat as though we were up in the Polo Grounds You know there are always a lot of ball players and umpires on the field, but we found there were a great many in the grandstand too

In regard to better representation throughout the State in matters of compensation your Committee recommends 'that regional representation from the *eight district branches constitute an Advisory* Council on Workmen's Compensation Matters acting as a Subcommittee of the Council Committee on Workmen's Compensation. It is the hope of this Reference Committee that the basis of representation in the State Compensation Committee be broadened to include eventually all parts of New York State

Your Reference Committee recommends approval of this portion of the report, and I so move

DR. SAMUEL B BURK, *New York* I second it

There being no discussion the motion was put to a vote and unanimously carried

DR. HOLCOMB Regarding the matter of physicians' reports your Committee must emphasize the fact that physicians themselves are largely responsible for delayed payments to claimants and physicians due to their own negligence in filling out complete and prompt reports We again urge Society members to pay more attention to these matters

In reference to the question of better medical care for uninjured workers, we wish to emphasize the importance of providing these workers the best therapy that medicine affords. If a colleague in a given

specialty can be of assistance in any case in which the period of disability can be reduced or in which a better functional result can be obtained, then such assistance should be sought and extended to the worker Complaints by the employer, the claimant, the carrier, or the doctor in cases of delayed authorization or inadequate care should be referred to the compensation committee of the county society Prompt and adequate measures in rehabilitation after consultation with qualified specialists is urged in order to obtain maximum function in the injured worker This, together with an enlightened attitude on the part of the employers and carriers, should yield better and more prompt results

Your Reference Committee recommends approval of this portion of the report, and I so move

SECRETARY ANDERTON I second the motion

There being no discussion, the motion was put to a vote and was unanimously carried

DR HOLCOMB Your Reference Committee heartily approves of the paragraph on the proper administration, control, and inspection of medical bureaus The Compensation Committee of the component societies should be aware of both their duties and responsibilities in this matter (I think that has to do mostly with the metropolitan district)

Your Reference Committee recommends approval of this portion of the report, and I so move

DR ANDREW A EGGSTON, *Westchester* I second the motion

There being no discussion, the motion was put to a vote and was unanimously carried

DR HOLCOMB Your Reference Committee again calls attention to the failure of recognition of the specialty of thoracic surgery We recommend that the chairman of the Workmen's Compensation Board be again urged to correct this situation and assign a rating of M-17 to this group of specialists in thoracic surgery

Your Reference Committee recommends approval of this portion of the report, and I so move

DR BENJAMIN M BERNSTEIN, *Kings* I second it

There being no discussion, the motion was put to a vote and was unanimously carried

DR HOLCOMB As regards the fee schedule, your Reference Committee has reviewed and considered the vast amount of work done and energy expended by the Advisory Committee on Workmen's Compensation Fee Schedule which was appointed by the chairman of the Workmen's Compensation Board, Miss Donlon Forty-eight meetings have been held by this Committee, and the views of all interested groups have been evaluated The members of the State Medical Society owe a debt of gratitude to this Committee for their voluntary and unselfish work, and especially to the chairman, Dr Nathan B Van Etten, and their secretary, Dr Walter P Anderton We believe that the fees as promulgated on June 1, 1947, are inadequate in view of the present increased costs of living and of conducting medical practice We, therefore, recommend that the chairman of the Workmen's Compensation Board arrange for a yearly consideration and review of the fee schedule to bring it in line with the prevailing rates for medical service throughout the State of New York We also recommend that the chairman of the Workmen's Compensation Board, Miss Donlon, designate the fee schedule as a "minimum medical fee schedule" in accordance with the provisions of Section 13—Workmen's Compensation Law

Your Reference Committee recommends approval of this portion of the report, and I so move

DR SAMUEL B BURK, *New York* I second the motion

There being no discussion, the motion was put to a vote and was unanimously carried

DR HOLCOMB In regard to the paragraph on Workmen's Compensation qualifications, we approve it in its entirety and call attention to the last sentence,

> "We urge the county societies to give even greater care to these functions so that the population may have full confidence that a physician is thoroughly competent once he has been so judged by the societies"

Your Reference Committee has reviewed the statements concerning the settlement of disputed medical bills in the four counties having a population of over one million We recommend that steps be taken to bring this procedure in line with the practice in vogue throughout the rest of the State where these disputed bills are arbitrated by a Committee consisting of five physicians

Your Reference Committee recommends approval of this portion of the report, and I so move

DR JOSEPH P HENRY, *Monroe* I second the motion

There being no discussion, the motion was put to a vote and was unanimously carried

DR HOLCOMB Your Reference Committee reaffirms the principle that radiology, pathology, and anesthesiology and physical medicine constitute the practice of medicine and should be treated as such Concern is expressed that the continued exploitation by hospitals of physicians in these fields will result in discouraging men from entering and developing these specialties We also recommend that the Workmen's Compensation Law be so amended as to preclude the practice of medicine in any form by any agency other than a duly licensed physician

Your Reference Committee recommends approval of this portion of the report, and I so move

DR HARRY ARANOW, *Councilor* I second it

There being no discussion, the motion was put to a vote and was unanimously carried

DR HOLCOMB Your Reference Committee has reviewed recommendations concerning legislation We urge that the recommendations of the Committee be carried out as embodied in this portion of the report

Your Reference Committee recommends approval of this portion of the report, and I so move

DR. REGINALD A HIGGONS, *Westchester* I second it

There being no discussion, the motion was put to a vote and was unanimously carried

DR HOLCOMB In regard to public relations, your Reference Committee heartily endorses the further development of the cordial and cooperative relationship between the State Medical Society, the Workmen's Compensation Board, and all agencies which participate in compensation matters We feel, however, that this relationship with the Workmen's Compensation Board and the State Society has notably improved during the past year, and we look forward to a continuation of this policy

We wish to express appreciation to Dr Kenney for his advice and help in our deliberations, particularly are we in debt to Dr Kalish for his counsel and able assistance in the operation of the Workmen's Compensation Bureau of the New York State Medical Society

In conclusion, it must be remembered in negotiations in the field of Workmen s Compensation matters that there are five separate agencies or groups whose viewpoints and interests must be considered

1 The Workmen's Compensation Board which administers the Workmen s Compensation Laws as promulgated by the New York State Legislature

2 The employers' group, representing industries who pay the bills.

3. The members of the State Medical Society who render care to injured workers

4 The insurance carriers, who adjust and settle claims of all parties concerned.

5 The employe groups in the State, both organized and unorganized

All parties concerned are entitled to be heard Our Council Committee on Workmen's Compensation has spent countless hours and days in meetings to attempt to evaluate and reconcile the interests of all these groups Everyone realizes from the endless negotiations being conducted today in the world by industry and labor that solutions which are eminently and completely satisfactory to all parties concerned are difficult to achieve It must be kept in mind that the basis of successful negotiations must inevitably be some form of compromise which is just and fair to all concerned After all the ultimate goal is to afford the injured worker the best possible medical care. Your Reference Committee desires to commend the Council Committee for its untiring efforts in behalf of the State s physicians and their relationship to Workmen s Compensation.

I move the adoption of the report as a whole

Dr. Arthur A Fischl, *Queens* I second the motion

There being no discussion, the motion was put to a vote and was unanimously carried

Speaker Andresen Thank you Dr Holcomb

Dr. J Stanley Kenney *Councilor* I would merely like to have one minute, if I may, to express to the Reference Committee publicly our appreciation and thanks for their efficiency and painstaking action in getting this report through as they have done. They should be highly commended because they had a very difficult problem to resolve They had some very heated discussion and spent a long afternoon over this. I do feel as chairman of the Council Committee I would be remiss if I did not express my appreciation of their effort

The other matter that I would like to proclaim is to substantiate what Dr Holcomb has read you in regard to Miss Donlon s feeling about the work of the two gentlemen who represented this State Society on the Advisory Council in connection with the fee schedule She has told me time and again of the untiring efforts and unselfish devoton and counsel that both Dr Anderton and Dr Van Etten gave her and I wanted to express to this House her appreciation of the cooperation that they gave.

Thank you!

Speaker Andresen Thank you Dr Kenney!

Section 97 (*See 9*)

Report of Reference Committee on Report of Council, Part I: Postgraduate Education

Dr. W W Street *Onondaga* Mr Speaker and members of the House this is the Reference Committee s Report on Report of the Council, Part I Postgraduate Education.

Your reference committee wishes to commend most highly the work of the Council Committee on Public Health and Education for the high level of instruction and friendly cooperation which it has rendered to all of the county societies and other medical groups in response to their requests during the past year This program has been made available through the combined efforts of the faculties of the medical schools and research institutions of New York State, the New York State Department of Health, the Dental Society of the State of New York, the Division of Industrial Hygiene and Safety Standards of the New York State Department of Labor, the Medical Society of the State of New York, and other organizations.

The committee has prepared and distributed to all county society officers and many others a *Course Outline Book* which lists subjects and speakers available, with the additional notation that current revision of the list is in process and will be sent as soon as prepared. For those who desire subjects or speakers not listed in the outline, a request directly to the chairman of the committee often results in the matter being satisfactorily arranged

At a meeting on December 10, 1947, in New York City, the Council Committee on Public Health and Education while reviewing its activities of the preceding year, expressed to the State Department of Health the appreciation of the Medical Society of the State of New York for not only the cooperation of the Department in the development of the programs but also for the financial assistance received Your Reference Committee wishes to second this expression of appreciation most heartily

For the year May 1, 1947, to May 1 1948, the committee arranged for postgraduate instruction in 39 counties, with a total of 208 lectures, while in the preceding year it had arranged meetings in 38 counties, with a total of 174 lectures.

In addition to this activity regional meetings and teaching days were arranged in eight counties plus a teaching day on Tuesday May 18 in connection with this State Meeting

Your Reference Committee believes that this work of postgraduate education, which has been so ably arranged and performed by your Council Committee under the able and energetic leadership of Dr Mitchell is one of the very important services which the State Society renders to its component county units. It urges that every effort be made to aid the committee in the continuance of this work.

I move the approval of the report as a whole

Secretary Anderton I second the motion

There being no discussion the motion was put to a vote and was unanimously carried

Speaker Andresen Thank you, Dr Street!

Section 98

Report of the Reference Committee on Report of Council, Part III Industrial Health

Dr. Harry Golembe *Sullivan* Your Reference Committee on the Report of the Council Part III Public Health Activities (A) Industrial Health County Health Departments, Rural Medical Service begs to submit the following report

Industrial Health.—This Committee under the chairmanship of Dr Leon H Griggs, Syracuse, did not have a regular meeting during the year The chairman did participate in the Eighth Annual Congress on Industrial Health of the American Medical Association in Cleveland Ohio on January 5 and 6 1948.

It was felt at this conference that the leadership in this work should be centered in the Council of In-

dustrial Health of the Medical Association Accident prevention work is of such great importance that it is recommended that the Study Committee should be increased so that special attention can be given to this phase of Industrial Health Lectures relating to the Industrial Health Program continue to be arranged through the Committee on Public Health and Education, and it is hoped that more counties will avail themselves of these lectures Industrial Health Teaching Days were held only at one meeting in Troy, and it is recommended that efforts be made to extend this program to considerably more counties and districts The work of this Committee is commended and your Reference Committee recommends that this Committee be continued

I move the adoption of this portion of the report

DR WILLIAM B RAWLS, *New York* I second the motion

There being no discussion, the motion was put to a vote and was unanimously carried

Section 99

Report of the Reference Committee on Report of Council, Part III County Health Departments, Rural Medical Service

County Health Departments and Rural Medical Service—The report of your Committee on Rural Medical Service under the chairmanship of Dr Dan Mellen, of Rome, indicated that greater activities are expected in this field during the coming years, particularly in a cooperative program aimed to attract physicians, dentists, and nurses to the rural areas This program is receiving aid from the postgraduate departments of some of the medical colleges, and plans are now being formulated to extend medical service into the rural and district communities, your State Society is now handling requests from rural communities for physicians, some help in this work is being obtained from the Grange and the 4-H, and work has been started among interested parties and organizations to form a Health Council under the sponsorship of this Committee

It is hoped to have a further report on the progress of the Hill-Burton program It is important to note that in counties of less than 50,000 population, county health departments must be formed before State and Federal aid for hospital construction can be received through the Hill-Burton Program, and it is recommended that this Committee publicize this fact

I move the adoption of this section of the report

DR IRVINE E GAGE, *Albany* I second the motion

There being no discussion, the motion was put to a vote and was unanimously carried

DR GOLEMBE It appears that prepaid medical care has not extended through the rural areas as rapidly as was hoped This appears to be due, in the main, to the fact that relatively few in the rural areas are engaged in industry, whereby hundreds of firms have paid for the entire cost of the hospital and surgical plan for all their employes and through payroll deduction have extended it to other members of their families and dependents It is recommended that the committee continue to study this problem so as to bring about a wider participation in prepaid medical service in the rural areas, and it is also recommended that the Committee investigate the possibilities of the State Society sponsoring a universal prepayment insurance plan so that the State can be covered as a whole, by one plan

I move the adoption of this portion of the report

DR ELTON R DICKSON, *Broome* I second the motion

There being no discussion, the motion was put to a vote and was unanimously carried

DR GOLEMBE The activities of this Committee are commended, and your Reference Committee recommends that this Committee be continued

I move the adoption of this portion of the report

DR HARRY ARANOW, *Councilor* I second it

There being no discussion, the motion was put to a vote, and was unanimously carried

DR GOLEMBE Now I move the adoption of the report as a whole

DR STEPHEN R MONTEITH, *Rockland* I second it

There being no discussion, the motion was put to a vote and was unanimously carried

Section 100 (Sec 50)

Report of Reference Committee on Report of Council, Part III Salary Scales for Public Health Physicians in the New York State Department of Health

DR HARRY GOLEMBE, *Sullivan* We have just one resolution that was referred to our Reference Committee That was the resolution introduced by Dr Henry E McGarvey, of Westchester County, pertaining to "Salary Scales for Public Health Physicians in the New York State Department of Health," reading

"WHEREAS, the health and welfare of the State of New York are dependent in many ways upon the satisfactory operation and performance of services provided through the New York State Department of Health, and

"WHEREAS, upon investigation it is evident that these services are suffering from a lack of essential medical personnel, and

"WHEREAS, the Commissioner of Health is handicapped in making replacements of highly important specialists because of inadequate salary scales, and

"WHEREAS, present available salaries for public health and laboratory physicians in the State Department of Health are not commensurate with incomes earned by physicians of like experience and training, and

"WHEREAS, 48 out of 96 full-time medical positions in the State Department of Health remain unfilled as a result of the low salary scales now in effect, and

"WHEREAS, important public health programs and necessary research cannot be carried on because of these conditions, and

"WHEREAS, these deficiencies threaten the health and welfare of the people of New York State, now therefore be it

"*Resolved*, that the Medical Society of the State of New York respectfully petition the Governor of New York to take prompt action to rectify this situation by means of

"1 Upward salary scale revision,

"2 The delegation of greater latitude to the Commissioner of Health to permit recruitment of personnel above salary scale minimums, and

"3 The simplification of Civil Service recruitment procedures as they pertain to medical personnel"

Your Committee approves every section of the resolution as reported, and hereby recommends that the Council be authorized to carry out the provisions herein contained

I move the adoption of this recommendation

DR. ELTON DICKSON *Broome* I second the motion.

There being no discussion, the motion was put to a vote and was unanimously carried.

SPEAKER ANDRESEN Thank you, Dr Golombo! We have not any more time this morning to discuss any more reference committee reports You have received the report of the Subcommittee on Cult Practices, which we ask you to study during your luncheon hour

Section 101

Authorizing Executive Session of the House of Delegates

DR. NELSON W STROHM *Vice-Speaker* I move that when the House of Delegates assembles in executive session this afternoon when it reconvenes at two o clock the reports of the Malpractice Insurance and Defense Board including that of the Actuary, Liaison Committee with the Veterans Administration, and the Subcommittee on Cult Practices be discussed thereat.

DR. EZRA A. WOLFF *Queens* I should like to second that.

There being no discussion the motion was put to a vote and was unanimously carried

SPEAKER ANDRESEN None will be admitted but members of the House, Executive State Secretary Executive State Officer Administrative Assistant Executive Secretaries of component county societies, Insurance representatives counsel auditor stenotypist, members of the Malpractice Insurance and Defense Board, and the chairmen of any Economics Committees of any county societies who may be present

Has anybody present any other suggestions for any further people who should be added?

DR WOLFF May I add the presidents of the county medical societies who may be present?

SPEAKER ANDRESEN Is there any objection to adding the presidents of such county medical societies as may be present?

There was no dissent expressed

SPEAKER ANDRESEN Really the county medical societies ought to elect their presidents members of their delegation

DR. WOLFF *Tell that to the county societies*

DR. HOMER J KNICKERBOCKER, *Ontario* We have with us a distinguished member of the Indian Medical Association Dr Sen I would move that he be permitted also to attend He is here for the purpose of observing our conduct and methods

DR. SAMUEL B BURK I second that

There being no discussion the motion was put to a vote and was unanimously carried

SPEAKER ANDRESEN Is there any objection to the list that I read of those who will be admitted to the Executive Session this afternoon?

There was no dissent expressed.

SPEAKER ANDRESEN We will now recess until two o clock sharp Dr Strohm will be chairman of the Committee of the Whole

At 1·05 P M., a recess was taken

Afternoon Session

May 18 1948

The House met in Executive Session at 2 o clock pursuant to recess.

SPEAKER ANDRESEN The meeting will come to order, please

At the meeting this morning I neglected to announce who the sergeants-at-arms are going to be Dr Dan Mellen of Rome is the Chief Sergeant at Arms, and Dr Wood of Kings and Dr Kircher of Albany are his assistants

I will now turn the meeting over to Dr Strohm, who will act as chairman of the Committee of the Whole sitting in executive session

DR JAMES F REULING, *Treasurer* There is in the House a former member of the Council and a former Trustee of this Society Dr John Bauer of Brooklyn. I move, sir that he be given the privilege of attending this executive session.

DR. SAMUEL B BURK, *New York* I second it

There being no discussion the motion was put to a vote and was unanimously carried

DR. REULING I would also like to move that the accredited delegates from our border states be given the privilege of attending this House during the executive session

DR. THOMAS M D ANGELO *Queens* I second the motion.

There being no discussion the motion was put to a vote and was unanimously carried

SPEAKER ANDRESEN The gentlemen named are invited to remain I will now introduce Dr Strohm chairman of the Committee of the Whole

VICE-SPEAKER STROHM Will Dr Mellon report as Sergeant-at-Arms? Is everybody in the room entitled to be here?

DR. DAN MELLEN *Councilor* Yes, sir this House is in order now for executive session.

VICE-SPEAKER STROHM I now declare the House of Delegates of the Medical Society of the State of New York in executive session

Section 102 (*See 23 30*)

Report of Reference Committee on Report of Malpractice Insurance and Defense Board

VICE-SPEAKER STROHM The first subject to be discussed is Malpractice Insurance and Defense Board Dr Koplowitz is the chairman of that Reference Committee

DR. ABRAHAM KOPLOWITZ, *Kings* Mr Speaker and members of the House I heard a very nice introduction this morning by Dr Di Natale thanking the members of his Committee. I want to take this opportunity to thank the members of my committee Dr Daisy H. Van Dyke Dr Harry S. Fish Dr Henry E McGarvey and Dr Harold B David son. I don t know how usual it is to have such harmony but it was excellent Your Reference Committee has made whatever efforts it could to study the report and get whatever information they could to help

To begin with your Reference Committee on the Report of the Malpractice Insurance and Defense Board has given the report the careful study it merits, and with due attention to the facts stated, we have especially concerned ourselves with the recommendations made

The Group Plan of Malpractice Insurance and *Defense has caused much debate and discussion* which at times, became acrimonious in several recent meetings of the House of Delegates. In all of these discussions your Committee feels that the

opinions expressed, whether right or wrong, were honestly intended, but certain fundamental points, which should be accepted as basic in any consideration of this subject, seem to have been overlooked or disregarded These are

First That the facts and figures, as presented by the Malpractice Insurance and Defense Board, be accepted as correct

Second That the members of the Board, appointed by the House of Delegates to have charge of and supervise the operation of the Group Plan, are hardworking, honest, and loyal members of our Society who are unselfishly and unstintingly giving of their time and energy in our service

Without the acceptance of these two premises, we shall have to start again where we were in 1921

The situation in the entire insurance field, as described in the report, is a well-known fact, and we must form our judgments in accordance with it

The report informs us that, in spite of the increase in the base rate early in 1947, after six months' experience the Yorkshire asked leave to withdraw from the field of malpractice insurance That fact requires some serious thought on our part because insurance companies do not retire from a field in which they have a reasonable prospect of profit

Your Committee wonders how many members of our Society are sufficiently acquainted with our Group Plan to understand the significance of the conditions which the Society demands of our insurance carrier Time does not permit a full description of them, but they are all set forth in a little booklet on the Group Plan of Malpractice Insurance and Defense, which was published by the Society in 1945 and distributed to all members at that time Additional copies can easily be obtained by application to the secretary of your county society Suffice it to say that more than a quarter of a century ago, some of our best minds, with the best advice obtainable, formulated the plans for our group insurance which is unique in the insurance business, particularly in the safeguards it provides for the members who seek protection under it These have not left rates and conditions of insurance to the whims or selfish interests of the insurance carriers but have controlled and made them flexible to accord with our loss ratios and changing conditions of the times as they arose In addition, they have assured our members the best and most expert legal defense counsel obtainable—thoroughly experienced and chosen by us

In the event of a suit against one of our members, not only is his pocketbook attacked, but what is more important, his professional reputation is put in jeopardy In these circumstances, surely only the best legal defense will do, supplemented by reliable protection against financial loss

The report informs us of the differential in rates which it has been necessary to create between the two parts of the State This, we feel sure, will arouse a good deal of criticism, and yet, those of us in the metropolitan area who carry automobile insurance know that members living twenty miles outside the metropolitan area get their insurance much cheaper It is the same with burglary and many other forms of insurance

It is a fact that, in view of the great difference in the number and cost of malpractice actions between the two sections of the State, the upstate members have been carrying a good deal more of the burden than they have been entitled to The Yorkshire now demands that a corresponding differential in rates be adopted to make the plan work equitably and to make it possible for the company to continue to carry our business Your committee is informed that the independent actuaries, under employment of the Society, have recently completed a study of the Group Plan and have concurred in the necessity for this differential

Finally, it should be noted that the Group Plan is not under the corporate ownership of the Society Although the Society has a great and unusual degree of control over certain details of the plan, in the final analysis, it is, and can only be, the liability of the company which carries it, and their interests must have equal consideration with those of the Society

The Yorkshire Indemnity Company has carried our insurance for twelve years It is as well managed a company as exists in the field and, if they have sought to be relieved of our business unless certain, necessary conditions were met, it behooves us to appraise our position carefully before we decide anything Particularly, we should have in mind that our loss experience, checked and verified by independent actuaries, provides no grounds for the belief that it would be any more favorable in any other company The losses, which control our rates, are not caused by the company which carries our Group Plan but by us who are insured under it

Other reliable companies have been contacted, and all of them have refused to consider our business under the terms and requirements laid down by our Society for the Group Plan The chairman of your reference committee contacted his own insurance broker, who is about the average that most of us deal with He was asked to secure a malpractice policy for me, but, after two days of effort, he reported no success All of the companies refused to write such a policy, but some of them referred him to the Yorkshire

The reason for the continuous increase in the number of suits and claims can, in a large measure, be laid at our door Too many doctors are careless and rely upon insurance to make good their mistakes Too many physicians are prone, unethically and unfairly, to criticize the next fellow Of course, this does not apply to the great bulk of our membership, but all of us must pay for it

We are informed by the Malpractice Insurance and Defense Board that they have been in contact with the American Policyholders Insurance Company, but they have been unable to get from a responsible officer of the company proposals for underwriting the Group Plan which could be approved and recommended to the Society (You heard yesterday a supplementary report, which is practically only for information stating these facts) This was reported to the House of Delegates in 1945, and recent contact with local representative of the company indicated that there has been no change in the situation

Some members of your reference committee have also been approached by that company, and we realize the temptation to buy something cheaper, but the question is Is it cheaper? In such a company, would we have the same protection and defense service, or would we lose ourselves in the morass of small print and be rudely awakened when in distress to the fact that some little clause we had overlooked, but ruthlessly enforced by the company, had deprived us of protection when needed most, like the member whose case is referred to in Section 4 of the Board's report?

Writing policies for individual members or even in a group form, on the company's own terms, would leave us at the mercy of that company as soon as the controls and safeguards provided in our setup were

abolished and the carrier of the Group Plan were forced out of the picture. It is only simple logic that, if our loss ratio continues or even approximates our present level such a company, with no binding agreement to limit and control their ratio changes, would charge us rates which would make those we have at present look small indeed

The Yorkshire Indemnity Company has faithfully discharged its obligations to us in the face of a huge deficit for them from our business Can we expect that any other company, without the help of our splendid proved legal staff, will do better? Even if we forgot our moral obligations to the company which has, so honorably, borne our losses, we would be foolish indeed to abandon the safeguards which have been established for our protection and which have served us so well, to gamble with any company which will not bind itself to the basic requirements adopted by this House

When we have to pay $35 for only $1 000 floater insurance for our personal baggage losses our present rates for $5,000 malpractice insurance protection do not seem very high.

The Board recommends that it be authorized to deny further insurance to members guilty of acts for which no reasonable excuse can be found, provided that such members may appeal to the Council if they so desire. We feel that our membership should do its part in helping to combat the growing seriousness of this situation and help to preserve our well tried Group Plan

For your information I want to cite four cases that have been taken from our records as an example of the type of cases referred to These should open our eyes to what can and does happen

1 During an attempted hysterectomy a surgeon failed to control so many bleeding vessels that the intern called another surgeon, who by chance was in the hospital, to save the life of the patient The second surgeon was so impressed with the inefficiency of the man who undertook the operation, that he summarily ordered him out of the operating room

2 A doctor attempting an extensive removal of a cyst on the inside of a boy's knee severed a main nerve, causing a dropping of the foot which went undetected for two months. Upon admission to a neurologic institute a 2-inch separation of the nerve was discovered, and the boy is crippled for life.

3 A physician was responsible for the death of a child to whom he gave a full dose of tetanus antitoxin without first giving a mandatory skin test. When confronted with this fact the doctor said "I never bother about that. '

4. A doctor placed both hands of a young woman under x ray for treatment, and shortly afterwards went home, having forgotten his patient An hour and a half later the attendant nurse shut off the x ray machine and reported to the doctor that she had done so

Your Reference Committee feels that this recommendation about refusing insurance to doctors who cannot give any reasonable human excuse for their misconduct should be approved, and I so move

DR. HOMER J KNICKERBOCKER *Ontario* I second the motion

There being no discussion, the motion was put to a vote and was unanimously carried.

DR. KOPLOWITZ In respect to the actuarial report by actuaries Wolfe, Corcoran and Linder, which was handed to us, and which is far beyond the scope of any of us doctors to analyze I want to ask the privilege of having one of the actuaries Mr Linder who is here, give us his summary of the report in much more detail than we could in our report.

VICE-SPEAKER STROHM It is granted Mr Linder!

MR. JOSEPH LINDER Mr Speaker, Ladies and Gentlemen, acting upon the instructions of your Society, we have recently completed an audit and actuarial study of your Group Plan of Malpractice Insurance and Defense, the report thereon having been filed with your Secretary In undertaking this work, we agreed to summarize and explain our report at this meeting

Our work was greatly facilitated by the complete and accurate records maintained for the Society by your Indemnity Representative The analyzed reports which he has furnished to the Society each year are referred to in our report and in this discussion as the *Statistical Data* Necessarily, much of our report is of a technical nature which cannot be explained to good advantage in a meeting of this size However I shall try, in as nontechnical terms as possible, to explain the significance of our findings and conclusions in a way that may be helpful to you

In a study of this character, it is assumed that the Society is interested in knowing

(*a*) Whether or not the records maintained by your representative and, therefore, the information furnished to the Society are complete and correct,

(*b*) Whether or not the rates have been correctly calculated and whether the operation has been profitable or unprofitable,

(*c*) What recommendations we can make to improve the operation of the Group Plan, together with any other comments which may be helpful to every one concerned

From an auditing standpoint, we found the accounts complete and correct, assuming that the audit made last year was correct as to the paid vouchers and premiums collected for the years 1936 to 1946 inclusive During the course of our audit, it was noted that the method used in accounting for exposures on delayed writings and cancellations did not follow approved practice However, it is believed that the influence of this departure from approved practice, with groupings of three- to five-year periods, is so small as to be negligible Accordingly we have assumed that the recorded exposures, for the purpose of our study and report are correct.

In our report, we have taken exception to the method used to determine current rates. Under the system used, these have been obtained from year to year by an annual review of the entire loss experience from 1936, when the present insurance carrier undertook the Group Plan down to and including the last calendar year While the entire loss experience should be utilized selectively for statistical indications, such as the number and ratio of claims to exposures, average settlement costs, etc. it seems to us that rate determinations should be made on more current experience as, for example the latest three or five policy years. Under ordinary circumstances, we would suggest the latest three policy years but, because the lag in reporting or settlement of losses is greater in malpractice insurance than in any other form of liability insurance with which we are familiar we believe that the latest five policy years should be used By the latest five policy years, we mean the latest five *expired* policy years. For example as of December 31, 1947 the latest five expired policy years would consist of the years 1942 to 1946, inclusive The policy year 1947 is omitted because the certificates issued during 1947 will not be fully expired until the end of 1948

The total loss experience is composed of the closed cases, the cost of which is known, plus reserves for outstanding cases and those which are as yet, un

reported In both of the latter groups the ultimate cost is unknown and, therefore, has to be estimated It follows, therefore, that the accuracy of the total will depend upon the accuracy with which these estimates are made Also, since these reserves are matters of estimates, it follows that the smaller the estimates are in relation to the total losses incurred, the more accurate will be the latter figure In our report, this is illustrated by examples which compare the constituent portions of losses incurred for the last five expired policy years with those for the last five policy years, as obtained from the standard limit section of Exhibit A of our report This shows that by using the last five expired policy years, the cost of closed cases, which is the known factor, represents 45 per cent of the total, whereas, by using the last five policy years this known factor represents only 29 2 per cent of the total Thus, aside from other considerations, it would appear to be highly desirable to omit from rate calculations the unexpired policy year which will always be the last calendar year of the period From the standpoint of both the insurance carrier and the members, we believe that modification of the rating formula in this regard would work out more satisfactorily than the present practice

After considerable experimentation with the data shown in Exhibit B of our report, we were unable to evolve any method which, if consistently applied, would have predicted with any greater degree of accuracy the total number of unreported cases as of the end of each of the years 1942 through 1946, if the unexpired policy year had been included Accordingly, we have also used the latest five expired policy years in determining the number of unreported suits and claims

That the method heretofore used did not predict a sufficient number of cases to arise appears to have been realized when the *Statistical Data* was compiled at the end of 1947 Although the method followed was the same as in previous years, there was introduced for the first time a trend factor based upon a comparison of the number of cases predicted with those actually reported during four of the preceding years Had the method we now recommend been used, it probably would not have been necessary to apply a trend factor

Except for the omission of the unexpired year of 1947, our calculation of the number of cases to arise, the details of which are given in Exhibit C of our report, closely parallels that utilized in compiling the *Statistical Data* as of December 31, 1947

Having arrived at the number of suits and claims expected to arise, it was necessary to ascertain the average cost of recent cases to obtain the probable cost of those to arise After extensive analysis, we concluded that the average cost of actions closed by year of settlement offered the best method of estimating the cost of factor Accordingly, we used the average costs for the last five years, including 1947, in order to utilize the latest figures obtainable This is shown in Exhibit D of our report

The reserves for outstanding suits and claims are established, primarily, by agreement between the legal counsel for the Society and the insurance carrier, and these are revised several times each year to make them as realistic as possible When taken into the *Statistical Data*, the total estimates for these cases are modified by a factor for probable salvage derived from comparison of the cost of closed cases with the reserves established for them As in the case of other elements of the *Statistical Data* these factors were determined by using the figures for the entire period since 1936 It seemed to us that it would be better to develop probable salvage factors from more recent experience Accordingly, those developed by us, as shown in Exhibit E of our report, were based upon the cases closed during the last five years While the method used by us appears preferable, the factors produced by our method do not differ substantially from those derived from the *Statistical Data*

Having obtained the loss experience for the selected period under what we believe to be sound actuarial methods, we were then in a position to compute the pure premiums and rates and to test those reported to the Society, as derived from the *Statistical Data* These are discussed at length in our report, but, for the purpose of this presentation, it will suffice to report that our calculation, based upon the 66 per cent agreed loss ratio, shows the following minimum rate requirements metropolitan area, $44 58, upstate area $24 42, State average, $38 21

The State average rate is $3 80 higher than that computed by your Indemnity Representative in the *Statistical Data* and $3 68 less than the current rates in use Considering the difference in the time periods used and the method employed, these results are surprisingly close, varying from each other by approximately 10 per cent It must be kept in mind, however, that the rates computed by us make no provision for the amortization of any accumulated deficit

The problem of determining the adequacy of the percentages charged for excess limits, that is, those in excess of the standard limits of $5 per 15,000, is rather a difficult one since it cannot be approached by the same statistical method as that used for standard limits Wide fluctuation in the loss ratios for excess limits were noted, varying from 11 per cent for policy year 1938 to 102 7 per cent for policy year 1945 The only test which can be applied to this element of the business is whether or not the excess limit rates are reasonable To test this, we made a computation of the excess loss ratio using our time period of the latest five expired policy years, and, oddly enough, we found that it was 66 per cent, which is exactly the same as the agreed loss ratio for standard limits If this ratio is considered reasonable for standard limits, it cannot be considered unreasonable for excess limits

The Group Plan is based upon a cost-plus agreement whereby the base rates for standard limits are determined from the cost of losses up to $5 per 15,000, loaded by 34 per cent for expenses and profit The question naturally arises as to whether this expense and profit loading is reasonable In our opinion, the loading factor of 34 per cent is entirely reasonable for agency insurance companies It must be kept in mind that this includes the profit ratio of 2 5 per cent to which the company is limited If this insurance were purchased from a direct writing company, that is, one which deals directly with the insurance buyers, it might be possible to save a few points on the expenses As an offset to this possible saving, however, the members would be obliged to deal, as individuals, directly with the company, and the Society would have to assume the cost of whatever insurance representation it desired to maintain

From our study, it appears that the members of the Society have secured their protection, throughout the period, for less than a fair rate This has resulted in a substantial loss to the insurance carrier In our opinion, a large portion of this loss was caused

by the fundamental error in the rating formula. We believe that, if our formula had been used each year since 1936 the accumulated loss, if any would have been of modest proportions

Because after many years, a differential in rates for the two parts of the State has recently been introduced, we feel that this innovation should have some comment In its simplest form, a group plan provides a *uniform rate for uniform coverage, the over* all or average rate being calculated with due regard for a diversity of hazards, such as, age, occupations etc , when these are grouped together in a heterogeneous mass. So far as geographic differentials are concerned, there is a sound underwriting reason for a distinction in rates, particularly where, as in the case of the Group Plan there is a wide difference in cost between two clearly defined areas. In a situation of that kind, an average state-wide rate does not appear to be appropriate For that reason, it is our opinion that the geographic differential should have been adopted at a much earlier date

As a result of our study, we have the following three recommendations to make

1. That the present system of accounting for all delayed writings and cancellations in the calendar year in which they occur be changed so as to account for them in the policy year to which they properly belong

2 That the rating formula be changed to include the latest five *expired* policy years as a basis for determining future rate changes

3 Assuming that the Society recognizes its obligation to the carrying company for the loss which has accrued, that some further study be given to the best method of amortizing that loss

It is a known fact in casualty insurance that more companies have been in and out of the malpractice insurance business than has been the case in almost any other form of liability insurance It is a difficult form of insurance to write, and so far as we know it has seldom proved satisfactory to any company The inordinate lag in the reporting and disposing of actions against doctors makes the loss experience look favorable during the early years of writing Later when the companies learn the actual cost of the business there is a rude awakening When that occurs, the companies are forced to seek greatly increased rates or to withdraw from the business frequently the latter It is not unknown in the past when companies have withdrawn from the field that many doctors most of whom have never had a claim suddenly find themselves unable to purchase insurance except at what they felt were exorbitant rates. Because of the unsatisfactory nature of this business, as near as we can ascertain, it is being written in small volume by a very limited number of companies.

We feel that the Society is to be congratulated upon the earnest effort it is making to solve this difficult problem for itself The Group Plan is soundly conceived and well managed In our opinion, the Group Plan can be successfully operated in the future on a basis mutually profitable to the members of the Society and the carrying company if the recommendations we have made are put into effect.

The Group Plan is almost unique in that the carrier has delegated a large measure of control over its business to the Society However this places upon the Society a heavy burden to insure that the interests of both sides are fairly represented. Whether or not this system results in decreased loss costs it is impossible to state, but it does insure the members against paying more for their insurance than it reasonably costs Furthermore, and possibly more important it assures that the professional interests of the members will always have consideration in the handling of claims against them.

The foregoing I think, fully answers the points of chief interest to the Society Thank you. (*Applause*)

DR. KOPLOWITZ Mr Speaker, would it be your wisdom to permit any questions to be asked of Mr Linder?

VICE-SPEAKER STROHM Yes I think that would be perfectly in order

Are there any questions of the actuary Mr Linder?

There was no response

VICE-SPEAKER STROHM If not thank you (*Applause*)

DR. KOPLOWITZ Mr Speaker to finish the report, the entire report seems to us to be a well rounded summary of our situation It is the result of painstaking conscientious and tireless energy that presents a sound attitude which the Society should adopt with respect to our malpractice insurance and defense program

We recommend that the Malpractice Insurance and Defense Board be empowered to continue the Group Plan on Malpractice Insurance which the Society has so successfully used up to the present time.

The Supplementary Report of the Committee on Malpractice Insurance and Defense concerning the American Policyholders Insurance Company was for information only

I move the adoption of this report as a whole.

DR. HAROLD B DAVIDSON *New York* I second the motion

There being no discussion the motion was put to a vote and was unanimously carried.

Section 103 (*See 65*)

Report of Reference Committee on Report of Malpractice Insurance and Defense Board Malpractice Insurance and Public Relations

DR. ABRAHAM KOPLOWITZ, *Kings* We have had a resolution referred to us introduced by Dr Frederick S Wetherell, of Onondaga County

'WHEREAS, it is apparent that the cost of malpractice insurance is constantly increasing and

WHEREAS, everything that might cause a malpractice claim is a source of bad public relations, and

'WHEREAS, the elimination of these causes serves also to eliminate one category of causes of bad public relations and

WHEREAS among these causes are Injury to a patient through negligence or ineptitude criticism of a colleague s work, made to a patient by another physician abandonment of the patient failure to treat each patient with meticulous attention to the requirements of good medical practice using undue optimism in prognosis, failure to give the patient a clear understanding of the diagnosis or treatment and

'WHEREAS it has been proven that removal of these causes by the institution of a militant public relations program has resulted in the practical elimination of malpractice suits and

'WHEREAS the Alameda County California, Medical Society has instituted a plan of medical public relations which has resulted in eliminating malpractice suits for the past two years, be it

Resolved that the Council of the Medical So-

ciety of the State of New York be instructed to study the Alameda County Plan, and as soon as feasible to institute procedures which will end in the employment of measures of like nature in the constituent county societies or district branches of the Medical Society of the State of New York."

Your Reference Committee has studied the resolution introduced by Dr F S Wetherell, concerning the study by the Malpractice Insurance and Defense Board of the Alameda County Plan on Public Relations and such other plans as may be helpful, and which are being used in other states and counties, and thinks it is a very wise one The Reference Committee feels that it may be useful to have such a study conducted in our public relations as affecting our insurance plan We, therefore, move the adoption of this resolution, and I so move

DR HAROLD B DAVIDSON, *New York* I second the motion

VICE-SPEAKER STROHM It has been duly moved and seconded that the resolution be adopted Is there any discussion?

DR THOMAS M D'ANGELO, *Queens* Mr Speaker and members of the House of Delegates, your Malpractice Insurance and Defense Board greatly wants to undertake this study Had it not been for the tremendous amount of work and detail that had been thrust upon your Board during the current year, with which you have undoubtedly become familiar by this time through our report and through the report of the Reference Committee, this study would have undoubtedly been undertaken long ago I had in mind as soon as assuming the chairmanship of the Board to make such a study, especially in our neighboring state of New Jersey, which handles this on a state plan, and in our neighboring state of Connecticut which handles this on a county plan, but your chairman and your board have have not found time this year to do that We welcome the opportunity this year to conduct such a study, and to do everything in every way possible to lessen the losses that our Malpractice Insurance Plan has had up to this time The Chairman of your Board endorses this resolution

The question was called, and the motion was put to a vote and was unanimously carried

VICE-SPEAKER STROHM Thank you! The entire report has been adopted

Section 104

Report of the Liaison Committee with The Veterans Administration

VICE-SPEAKER STROHM The next order of business is discussion of the Veterans Administration matter, which will be opened by Dr Bauckus

DR HERBERT H BAUCKUS, *Past-President* Mr Speaker, Ladies and Gentlemen of the House, I am reporting to you as chairman of your Liaison Committee with the Veterans Administration I am also the President of the Veterans Medical Service Plan of New York, Inc That Plan is a separate body, it is an independent organization, but of course it has its parentage in the Medical Society of the State of New York

Some of you heard this morning that we are going to have some resolutions acted upon by the Reference Committee, and they will be presented for your consideration later on They are largely the outgrowth of our experience in this Plan during the last two years

We began in September, 1946, to work under the Home Town Medical Care Program I would like to report to you a meeting that a committee of the American Medical Association, of which I am chairman, had with Dr Magnuson in Washington some ten days ago, the first meeting we had with him since he had become director, and also a meeting we had on that same date with the American Hospital Association I think you need to know about this because it may be up to you, and I think should be up to you, to decide what kind of a contract, if any, the Veterans Medical Service Plan shall make with the Veterans Administration for the next year The time for that is before August 7, 1948

I would like to quote one or two figures, although I know you are not desirous of hearing many of those In the metropolitan area, the five counties of Greater New York and a certain number of counties outside them, in April, 1947, for the pay of physicians on the fee basis the amount of money was $239,364, in October, 1947, the amount was $149,060, in the next month it was $65,000, and in the month of December, 1947, it was $29,481, and in April of 1948 it was $17,955 That decline from $239,000 to—by the way the lowest figure was in March, 1948—$13,000 in this metropolitan area was greater than in the other branches of the State, nevertheless, it is a fair indication of the changes that have taken place in this kind of service

I think we should have a little review of the history of this Plan, the general plan, which was first adopted by the American Medical Association and then by various states of the United States

Point Seven of the Ten Point National Health Program of the American Medical Association is captioned "Veterans' Needs for Hospital and Medical Care" It begins thus "A program for national health should include the administration of medical care, including hospitalization, to all veterans, such medical care to be provided preferably by a physician of the veteran's choice, with payment by the Veterans Administration through a plan mutually agreed upon between the state medical association and the Veterans Administration"

The American Medical Association has given sincere and active support to this objective It arranged numerous study conferences, and it urged its state medical associations to implement active programs in each state In November, 1947, the American Medical Association sponsored a National Conference on the Veterans Administration Home Town Medical Care Program

The Veterans Administration found, soon after the close of the active wars with Hitler and Japan, that its need of facilities and its financial resources for medical and hospital care for veterans had been grossly underestimated Since 1945, the organizations of medicine, county, state, and national, have been in active endeavor with our government officials to restore the health and prolong the life of the veteran, especially in that group suffering from service-connected disability or disease

The Chief Medical Director of the Veterans Administration appeared before the House of Delegates of the American Medical Association and frankly stated that the colossal task of providing needed medical care to the great group of returning veterans could by no means be cared for in the Veterans Administration alone He pleaded for the cooperation of the profession and asked that state societies arrange to make contracts with the Veterans Administration to give service on a fee basis system He stated that as much use as possible would be made of existing Veterans Administration facilities, but that a great deal of the service-connected dis-

ability and disease would need to be handled by out side care. He stated that he believed that as far as possible this additional service should be rendered on the private practice methods in vogue with the American profession, and that in conformation with this principle a free choice of personal physician should be available to the veteran He expressed the hope that the program would be greatly im proved over the methods formerly existing in Vet erans Administration care, a point of much interest to the profession at that time because there had been severe criticism of previous medical service in this branch of the government

The Director emphasized the need for immediate action. He pointed out that in no way was the serv ice-connected case one of welfare or charity but that it was a direct and definite obligation of the United States Government to give the veteran the benefit of the highest quality medical service avail able in this country He asked for the cooperation of the medical profession to make this possible Reference was made that, although the teaching of medicine in the hospital was consistent with the high standards of care nevertheless, the first considera tion was not the use of the veterans as teaching ma terial. The slogan, "Highest Standards of Medical and Hospital Care," became a feature of the earlier discussions on veterans' medical services and formed a sound reason for general public approval of the Home Town Medical Care Program. The theme 'Medical Care Second to None' appealed to all

The Director stated that he realized the achieve ment of providing the highest kind of service to the veteran would demand adequate payment for serv ices so that we could reasonably ask any skillful and experienced physician to participate in the pro gram He wanted the government protected as to costs and merely asked that the fee schedule be no more nor less than that regularly prevailing in the community in question. He said that, although we were venturing upon a new and gigantic program with little preparation, it appeared to him that we should ask the various state societies to make con tracts with the Veterans Administration so they would act as a unit for care in a given state The contract would of course outline more detailed plans including the adoption of a state fee schedule. He urged the early enactment of actual care in the Home Town Medical Care Program.

To this laudable and scholarly outline of the vet erans health program the House of Delegates of the American Medical Association gave spontaneous and wholehearted approval. The event was followed by sympathetic general support of the state and county medical societies. Committees on veterans' medical and hospital care were formed, and by the summer and fall of 1946 the program was actively under way

There was genuine admiration and respect for General Hawley in his stand for the acknowledged best methods inherent in the American system of medical care To this day the great majority of the medical profession sincerely regrets the Director s departure from the service, and it has high hopes that his successors will continue to uphold the ideals of the practice of medicine

There were misgivings as to the ultimate outcome of the private care program by some physicians It is to the credit of the profession that it brushed aside some serious doubts of the outcome of these new projects in order to rally to the demand for prac tical care. It knew it had the answer and success would attend if it were allowed to proceed. Besides many of the physicians were veterans and had the sympathetic understanding so necessary to combat the many problems

It may be well to review briefly some of the objec tions. I enumerate a few of them

1 The program although at first ideal might be changed by some of those in authority so that it would later tend to the socialization of medicine There was the fear that the services provided would be extended to members of the veteran s family hav ing no military service or even to the general popula tion It was realized that such an extension would not only lead to a drastic lowering of standards, but that it would be quite impossible with the limited professional personnel in this country The realiza tion that such a final extensive program would be far too costly for the American taxpayer would come later on

I have no doubt that there were and are, many who hopefully looked forward to a socialization of medicine program comparable to compulsory sick ness insurance From my experience in my own State of New York I feel that some physicians, in cluding quite a few in the Veterans Administration in that State looking forward to the dissolution of the personal care thoels, have, by word and deed not only sought the return to the old bureaucrat system but the inauguration of more and more socialization features Some of them in my opinion envision the success of legislation of the Wagner Murray Dingell type enhanced by misdirection of our well-intentioned and simple desire to assist in a medical crisis

2. The fear that so-called government red tape would irk and confuse the veteran and the physician.

3 The fear that political interference and mis understanding could corrupt the program

4. The impression that such a quickly organized gigantic nation wide program would present many administrative difficulties which could result in dam age to the reputation of the American practitioner of medicine

No one seriously pressed the embarrassing ques tion of why these preparations had been made so late at least two or three years too late Concern was expressed over the future building of many new hospitals whose beds were needed now It would take a few years to build these hospitals, and some of them are to be under construction until at least 1951

At this point I might say that a committee of the American Medical Association met at the invitation of the American Hospital Association with a com mittee of that latter Association which meeting was attended by the President and many of the top offi cials of the American Hospital Association, and they had a several hour discussion with us on this subject in which they presented in no uncertain terms their criticism of the Veterans Hospital Program I may appear to be rather critical but they published this pamphlet *Federal Hospital Planning With Par ticular Reference to Care for Veterans* They have a new paper known as *The Position of the American Hospital Association on Veterans Hospitals.* They presented other papers which I have here on the subject. They are I would say bitterly op posed to much of the program in present-day veteran hospital administration and also that relating to fu ture construction.

There are many interesting items to be observed on this question of new hospital construction We are having two systems of hospital construction fostered by the Federal Government We have the Hospital Survey and Construction Act, passed by

Congress, which will result in the construction of new hospitals and public health centers throughout the country This Act under the Hill-Burton Bill provides integrated planning for construction of nonfederal hospitals, with guidance at the Federal level and major planning on a state basis According to a recent publication of the American Hospital Association, Congress has currently appropriated $772,702,814 for expansion of veterans' hospitals The Hospital Survey and Construction Act authorizes Federal assistance to the states in the amount of $75,000,000 a year, over a five-year period (not yet appropriated) On the basis of two-thirds matching of local funds there would result a total nonfederal hospital construction program of $1,125,000,000 in five years if Congress appropriates funds to the extent authorized In emphasizing the arguments for the desirability of over-all planning in the expenditure of Federal funds for hospital construction so that the system may serve not only veterans but their families and the balance of the population as well, this publication of the American Hospital Association states "Had there been satisfactory planning at an early period, tremendous sums invested in Veterans Administration hospitals and in the care of veterans might have been utilized for this purpose through a grants-in-aid program to the states, with standards of care and eligibility of veterans controlled by the Federal Government"

We expect 150,000 beds in Veterans Administration hospitals by 1951 In a release of statistics by the Veterans Administration of veterans awaiting admission to hospitals as of October 15, 1947, there were 16,917 nonservice-connected cases awaiting hospitalization, and of these 11,568 had been waiting over forty days

This is startling information and requires further consideration It should be pointed out that we are now speaking of nonservice-connected cases The nonservice-connected applicant in making application for entrance to a veterans' hospital must declare that he is not financially able to pay the necessary expenses of hospital or domiciliary care He does that by filling out an application which states "Application for Hospital Treatment or Domiciliary Care" and answers yes or no to the question, "Are you financially able to pay the necessary expenses of hospital or domiciliary care?" If he writes, "No," that is all there is to it The legislation provides that no question shall be made of the veteran's statement, nor have there ever been to our knowledge any investigations of that If this requirement were carefully observed, or if there were some income bracket qualification, the more needy veterans could be granted the hospitalization often urgently needed in this class Next to the service-connected case, this economic group should have the first consideration A more realistic adherence to the requirement would eliminate the tendency to "boarding" in some instances If beds for these cases are not available in Veterans Administration hospitals, it would appear that provision should be made in the local private or community hospital The Hill-Burton program is designed to provide additional beds in localities where needed

There is another reason for the 11,586 veterans awaiting hospitalization over forty days It is that of the policy in force for the service-connected disease or disability The fee basis or Home Town Care Program is limited to the service-connected disease or disability However, in the past year, hospitalization in private hospitals has been denied the veteran except in acute emergency and in the case of women

I might say that was the first start in the change of our Home Town Program The first thing that happened to interfere with it seriously was the refusal to provide local hospital care, which meant that there was very little free choice of physician in the case of surgery and any case requiring hospitalization

If the service-connected case were handled under our local care, including home community hospitalization, there would be beds for the needy nonservice-connected case It is unfair to the surgical cases to deny them the same kind of care available to the medical cases and works an additional hardship to the veteran and to his visiting family if he must travel to a distant hospital If it is the intention of the Congress to give unlimited hospitalization to all nonservice-connected veterans regardless of their financial status, then it should be so stated and appropriations made to carry out the provisions of such an act

I could tell you a great deal about this hospitalization program, but I think that is enough for the time being I am not nearly so emphatic in this matter as is the American Hospital Association

The next important point I would like to talk about is the conference with Dr Magnuson, and what he told us amounts to a great deal the same as he expressed in this communication to Dr Lull of the American Medical Association We discussed that with Dr Magnuson at that meeting, and I think I can save you time by reading this page

> I have been thinking seriously, since I had the conversation with you and Sensenich and some other members of the Board of Trustees of the American Medical Association in Chicago, how we could hook up with the medical profession in this veterans service work
>
> I have just come back from a trip where I went over a lot of our regional offices, and I am very unhappy about the kind of medicine that is being practiced in those places The histories of clinical records are not where they should be in the treatment folders, and the discharge examinations furnished by the Army and Navy are not in the treatment folders so the doctor making the examination does not know the previous history unless he sends for the C file and that takes from three hours to three months to get. They are so pressed that very few competent examinations are made when the patient applies for treatment and the treatment resolves itself into nothing but the treatment of a symptom. Part of it is due to lack of professional personnel lack of space lack of equipment and lack of clerical personnel There are two medical functions in the regional office One is purely and simply examination as for determination of what a man has coming to him in the way of pension due to his disability if any The other is treatment of patients who come to the dispensary complaining of symptoms and who are all service-connected cases Some of these cases undoubtedly come in for treatment so they can build up a record of having had a lot of treatment so that in the future if there is any question of a pension examination they will have a large treatment file Each of these cases should have a thorough and competent physical examination because if they have treatment coming to them we want them to get it and get the best If they do not have treatment coming there is no reason why they should be pampered However we want to be sure and cannot be sure without a thorough examination of the patients' condition
>
> I have thought of two plans that we might put into effect These are connected with the treatment part of the situation only and must not be confused with the pension examination which must necessarily be done in the regional office by men who are trained to make pension evaluations and summaries of medical histories and records

Dr Magnuson asked if I would see what county societies thought about this

> Plan Number 1 To request the county medical society in cooperation with the chief medical officer in cities where regional offices are located, to set up an examining clinic with the best men obtainable for the examination and treatment of patients presenting themselves with medical complaints Sign a contract with the medical society for delivering this service in quarters that the society would provide and equip as a clinic for this purpose The county

medical society through its veterans committee, to act as a recommending body to the chief medical officer so that the men from the county medical society might be appointed as part-time VA doctors appearing at the clinic at definite times anywhere from four hours a week to as much time as the doctors felt they could spare from their practice The doctors could be paid on the basis of the grade to which they were entitled i.e., a young man just out of medical school, interned for a residency could be appointed in junior grade at $4 149 60 to $4,903 per annum, and the salary figured out on the basis of forty hours a week Our grades progress as follows: associate grade $1 902 to $5 905.20; full grade $5 905.20 to $6 869.80; intermediate grade $7 102.20 to $8,050.80; senior grade $8 179 80 to $9,376.60; chief grade $9 975 to $10,900 An additional 25 per cent for board certification is paid by the VA up to a limit of $11 000 per annum Consultants could be appointed on the same basis and either be on call at a specified amount per call or, if there was enough work, they could come in for a certain number of hours per week and have appointments made just as one does in one's own office This plan should take the patient care away from the pension examination doctors and save a lot of confusion.

Plan Number 2 Set up a Treatment Department in our regional offices to be staffed by the same method mentioned above The trouble with this plan is that many of our regional offices are so cramped for space and so short of personnel both clerical and supervisor, that it probably would not be feasible. However where it was feasible it would work as well as having a clinic on the outside There would be no objection to using the same consultants in the pension examinations who were used in the treatment clinic, whether it was set up one way or the other

It is my opinion that the veterans medical committee of the medical society would probably be interested in two ways They would be interested as veterans in seeing that other veterans get good care and as taxpayers to see that there was no imposition on the government in allowing claims that were not just. At least they would be more specific in their records as to whether a man was or was not a bona fide case.

Our answer to that—and we have been in consultation with them—is 'What is the matter with our present plan? It was working all right until the various branch officers picked it all to pieces.

Following that I asked Dr Butler, who is the Branch Medical Director of New York in a letter dated April 15 1948—I had previously talked to him on the telephone, and he asked me to write him a letter—this

Dear Doctor Butler:

We have received several inquiries relating to the medical services being rendered to service-connected cases by outpatient physicians and by outpatient clinics of the Veterans Administration.

Some of these patients have previously been cared for under our Veterans Medical Service Plan and some of them have again been referred back to the physician participant in the plan. I am also informed by Secretary George F Lull, M. D. of the American Medical Association that Doctor Magnuson requested that, through county and state societies we urge physicians to enter into part-time and full time employment in various out patient departments.

Therefore, in New York State I should like to go into our various branches and ascertain more fully the services now being rendered I should like to limit this inspection to that done by our coordinators or by myself personally We should be glad to do this at the various branches in company with someone assigned from the branch inspected At the present time as you know our coordinators have knowledge only of those patients whose records they review In order to give approval to the general health services, we require this additional information. More especially it would mean that the coordinators could follow the treatment course of any service-connected patient as is done in our plan Th coordinators would visit the clinics on occasion. We should like to have the names of physicians their ratings, especially qualifications, and the number of patients they see within a given time This would answer the question of adequate staffing of outpatient departments. We should like some information on the career possibilities for part time and full time employment. The information obtained in the study would be in the same category, as far as confidential information is concerned as that of the work of the coordinators in their past and present capacity I shall much appreciate it if you will allow us to make this study

I wrote that as president of the Veterans Medical Service Plan of New ork Inc and on May 3 received this reply

Dear Doctor Bauckus

Please pardon my delay in replying to your letter of April 15, 1948. I have been out of town for much of the intervening time. Your request is so sweeping and includes so many items which might be regarded as confidential information that I do not feel capable of acting upon it myself I am therefore, referring your letter to higher authority

In the meantime your Coordinators can, of course, continue to send you the same reports that they have forwarded in the past. The present agreement between the V terans Administration on the one hand, and the Veterans Medical Service Plan of New York, Inc acting as agent for the Veterans Administration in providing such care for veterans as the VA is unable to provide in its own hospitals and clinics, runs from year to year concurrently with the federal fiscal year

With very kind regards, I am,

Very truly yours,

Ethan Flagg Butler M D

Branch Medical Director

There are one or two more points. We have been criticized on our fee schedule. The fee schedule is a fee schedule carefully worked out by many physicians and many times discussed with the Veterans Administration It is their fee schedule as much as it is ours We have agreed to and we have made changes where changes were indicated. Any criticism of that fee schedule should be placed upon the Veterans Administration as much as upon our Plan I can see no just criticism of it.

I have heard at times doctors say that some fellows have killed this Plan that they have received too much money as a result of it, that in one way or another they have interfered with good medical care. We have a system in this Plan through our coordinators, and the fact that the coordinators review every report where we know what is going on all the time Never has the Veterans Administration pointed to us about any case at all that we did not immediately investigate it and take action on it. The coordinator if he thinks it is the thing to do advises the removal of the physician from the list. Then I have the right given to me by the Board of Directors immediately to make that removal We have removed six men from the list. In one case it did not apply very well because it was not long before this man was employed as a full-time man by the Veterans Administration here in New York. We inquired about that but they said he was a good man and what he did was not so very bad.

In the resolutions that are presented this morning there are two important items. One is that we ask for the free choice of physician There are so many ramifications about all of this that it would make your hair fall out to think about it and to keep up with it. The reason my hair doesn t fall out is that I have a good hair tonic I think the only way you can handle it at all is by insisting upon the free choice in the new contract—if we have a contract

I might say that Dr Harding who is the assistant director at Washington of this work, and with whom we have talked several times in the past two years, at our last meeting told Dr Anderton and myself that he thought that the coordinators ought not to be employed by the Veterans Plan but by the Veterans Administration itself In other words that will take us out of it entirely

The other point is that I hope we can some time arrange a meeting so that in one room we may have representatives of the veterans organizations of the Veterans Administration, and of the Medical Society of the State of New York. I don t believe that the veterans realize how much is being taken away from them when they lose free choice of physician. Your Board of Directors of the Medical Service Plan has always taken the position that the veteran

may go to any facility that is available, but if he wants free choice he should have it If in New York State under our Workmen's Compensation Laws, the person who was injured during the war working here at home shall receive free choice of physician, as is the case, why shouldn't the veteran in the service-connected case? He is the same sort of case, and I don't think we can take any other stand

I shall be very glad to furnish you with additional information if you would like to have it Nothing I have said here is but what is on paper, so as far as I am concerned, there is not any need for this to be a closed session

VICE-SPEAKER STROHM This report of the President of the Veterans Medical Service Plan, Inc , is open for discussion

There was no response

VICE-SPEAKER STROHM If there is no discussion, is there any motion?

DR HARRY ARANOW, *Councilor* I move it be received with thanks

DR D V CATALANO, *Richmond* I second it

There being no discussion, the motion was put to a vote and was unanimously carried

Section 105 (*See 61, 106*)

Report of Subcommittee on Cults

VICE-SPEAKER STROHM We will now go into the discussion of the Report of the Subcommittee on Cults of the Council Committee on Legislation, of which Dr Dattelbaum is the chairman

SECRETARY ANDERTON I move that Dr Lochner, the Secretary of the New York State Board of Medical Examiners, be invited to the House during the rest of this closed session

DR. HARRY ARANOW, *Councilor* I second the motion

There being no discussion, the motion was put to a vote and was unanimously carried

VICE-SPEAKER STROHM Will somebody near the door get Dr Lochner and escort him in?

Now may we hear from you, Dr Dattelbaum?

DR MAURICE J DATTELBAUM, *Councilor* Mr Speaker and members of the House of Delegates, this report was referred to the Reference Committee on Legislation Dr Eggston is the chairman of that Reference Committee, so the procedure that I thought would take place would be that the Reference Committee would bring in its report, and if there were any questions, I would answer them because everybody has received a copy of this report

If the House wants me to report what we have done, and then hear what the Reference Committee suggests, why that would be all right with me

CHORUS No, let's hear the Reference Committee first

DR JAMES F ROONEY, *Trustee* I move we hear the report of the Reference Committee first, and that Dr Dattelbaum may then be called upon to explain any points in the original report that may come into question

DR SAMUEL B BURK, *New York* I second the motion

There being no discussion, the motion was put to a vote, and was unanimously carried

Section 106 (*See 61, 105*)

Report of Reference Committee on Report of Council IX Report of Subcommittee on Cults

DR ANDREW A. EGGSTON, *Westchester* I don't want to be a copycat, but I will match my committee for punctuality and efficiency with any of the rest of them It consists of Dr John L Edwards, Dr Samuel B Burk, Dr A W Martin Marino, and Dr Felix Ottaviano, and, as you will remember, the whole book was thrown at us yesterday I won't attempt to read it all, but when we get through you will get it most likely

Your Reference Committee has reviewed the extensive report of the Subcommittee on Cults of the Council Committee on Legislation Cognizance was taken of the thorough method and scientific approach to this question by the committee You have received the report, as it was distributed this morning, and you have undoubtedly read it by now Your Reference Committee recommends to this body for deliberation two distinct paragraphs in this report In case you did not memorize the report, let me give them to you

First, the last paragraph, part one, page 6, which reads as follows

> "After considering all phases of the matter, the Subcommittee unanimously voted to recommend to the House of Delegates that the Legislative Committee be empowered to draw up and have introduced legislation to implement the enforcement of the present Medical Practice Act by the use of the injunctive procedure against cult practitioners It was suggested that the Legislative Committee consult the legal staff to consider the availability of any other efficacious measures in addition to the injunctive procedure"

Second, the penultimate paragraph in Part 3, page 8, which reads

> "The Subcommittee, after intensive study of the Basic Science Laws in other states, believes there is some merit in the principles involved but recommends that the House of Delegates does not approve a Basic Science Law in this State at this time as our Medical Practice Act performs the same functions"

Your Committee recommends that the wording of this paragraph be changed as follows

> "The Subcommittee, after intensive study of the Basic Science Laws in other states, believes that there is some merit in the principles involved, but suggests to the House of Delegates that they find no need for a Basic Science Law in this State at this time, as our Medical Practice Act performs these same functions"

To quote the report further

> "The use of this injunctive procedure, as recommended in Part II of this report, is recommended, to control cult practice in New York State"

Your Reference Committee approves this report for discussion, and furthermore "urges the Council to introduce the necessary recommended injunctive legislation in the 1949 legislation session," if the House of Delegates concurs in this action

I move the adoption of this report

DR SAMUEL B BURK, *New York* I second the motion

VICE-SPEAKER STROHM You have heard the motion made and seconded that this report be adopted Is there any discussion?

Do you want that adopted as a whole?

DR EGGSTON As a whole, yes

After much discussion, the report of the Reference Committee was adopted

Section 107 (*See 15*)

Report of the Reference Committee on Report of Council, Part IX Legislation

DR. ANDREW A EGGSTON *Westchester* Your Reference Committee has reviewed with interest the work of the Legislative Committee

It is noted that while the 1948 session of the New York legislature was short, it was, nevertheless, a very busy one because of the record number of bills that were introduced Your Legislative Committee followed diligently 93 bills in the Senate and 125 in the Assembly, with the notation that of 121 individual bills 31 were passed by both houses. The Governor signed 29 and vetoed two These bills received an unusual amount of devoted attention by your Legislative Committee which issued frequent and concise bulletins to other legislative committees and thus directly to members of the Society Their deliberation resulted in final and crucial influence upon many bills.

There were no bills against vivisection introduced at this session. Likewise, no chiropractor bill appeared which received serious consideration How ever, in view of such a contingency the committee was fully prepared by a full-fledged campaign to defeat such an effort. The calmness by which this defeat was taken by those interested may simply presage a much greater effort to have a licensing law enacted Therefore, eternal vigilance must be our watchword

Your Reference Committee wishes to point to a serious and fatal development in regard to three bills which were introduced at the request of certain interests in the State Society

First, Fino-Clancy X ray Bill which met with so much opposition from some angles of the medical profession that resulted in its amendment which would have caused its defeat as a result, your Legislative Committee had to retract its former position of support.

Second, the Fino-Hanniford Bill which was contrived to return many medical activities to the county medical society in the medical care of workmen s compensation. This bill after it was introduced, failed to receive strong support from many sections of the State

Three, the Young-Graci Bill which related to the penal punishment of anyone treating the human body without proper licensure. This was defeated because of the vagueness of its construction which made it undesirable.

It is indeed a bad position in which to place the Legislative Committee and Executive Officer to be compelled to retract their position in regard to any bills introduced. It has happened that bills have been favorably voted by both houses at the urgent request of our representatives only to have them be opposed later as a result of belated medical opposition.

The Governor has even been urged to veto bills that have been passed which were not opposed and even received a measure of support. Such poorly considered actions will greatly weaken the position of the medical profession in obtaining the passage of proper legislation to say nothing of the ominous position in which the Medical Society is placed. All groups, and especially the specialty ones, should first develop a unanimity of opinion before bills are introduced and support solicited. In other words let me interject that we must not be like the man on the flying trapeze.

As a result of a number of bills, provision was made for the establishment of a State University to encompass medicine as well as many phases of education This action will undoubtedly have far-reaching effects upon medicine, and its deep roots will have to be carefully followed with a watchful eye for any detriment to the present educational standards and medical care in this State.

Numerous other pertinent bills were carefully considered by the Legislative Committee but brevity is here exercised in their review

The Legislative Committee finally appealed to all members of the State and county societies to be vigilant and use their influence in educating the public and their legislators of all important matters for the medical good of the public. It is needless to repeat that these are changing and testing times and your Legislative Committee is our most important agency to aid medicine in the proper adjustment to all new phases of human welfare.

The report of the Legislative Committee should be carefully read by all members of the Society The Legislative Committee, as well as our executive officer Dr Robert E. Hannon deserve the gratitude and open recognition of this House of Delegates.

Your Reference Committee recommends the adoption of these reports of a Legislative Committee consisting of Drs. Aranow Mott, and Holcomb and I so move.

DR. SAMUEL B BURK *New York* I second the motion

There being no discussion, the motion was put to a vote and was unanimously carried

Section 108 (See 38 49)

Report of Reference Committee on Miscellaneous Business B Change in Constitution of American Medical Association in Regard to Acceptance for Membership of Doctors in County Medical Society Irrespective of Race, Color, or Creed

DR. WILLIAM B RAWLS, *New York* I have two resolutions that I would like to report on in executive session one from Dr Burk of New York County and the other from Dr J Lewis Amster of Bronx County

We have considered both of these resolutions as one since they both relate to the same question. The one presented by Dr Burk of New York County, I will read in toto Dr Amster, who presented the one from Bronx County was a member of my committee and agreed to accept the one from New York County and also to accept what corrections we made in it

The subject is changing the Constitution of the American Medical Association in regard to acceptance for membership of doctors in county medical societies irrespective of race color or creed

As revised, it reads

"WHEREAS some county medical societies in various parts of the United States exclude from their membership physicians of certain races, regardless of their professional ability or ethical standing and

"WHEREAS, physicians so excluded from county societies are thereby excluded from membership or fellowship in the American Medical Association and

"WHEREAS physicians excluded from membership in the American Medical Association are for that reason denied the right to apply for membership in other national professional societies where membership in the American Medical Association is a prerequisite, and

"WHEREAS these physicians are thereby restrained in the legitimate pursuit and furtherance of their professional activities, and

"WHEREAS, this exclusion of physicians on the basis of race constitutes a violation of our American democratic ideal, therefore be it

"*Resolved*, that Article 4 of the Constitution of the American Medical Association be amended in the following manner The present Article shall be Section 1 of the new Article 4 and the following paragraph shall be added as Section 2 of Article 4

'No component Society of the American Medical Association shall exclude any qualified physician from its membership by reason of race, creed, or color,'

and further be it

"*Resolved*, that the delegates of the Medical Society of the State of New York shall be instructed to introduce this resolution at the annual meeting of the House of Delegates of the American Medical Association at its annual meeting in 1948"

Your Reference Committee made very slight changes therein The first one, two, three, and four "whereases" are all the same The fifth "whereas," which read as follows

"WHEREAS, this exclusion of physicians on the basis of race constitutes an affront to our colleagues, a degradation of the honored traditions of our profession, and a violation of our American democratic ideal,"

was changed to read

"WHEREAS, this exclusion of physicians on the basis of race constitutes a violation of our American democratic ideal,"

and then it follows through the same with the resolved portion except it ends this way

"*Resolved*, that the delegates to the American Medical Association from the Medical Society of the State of New York shall be instructed to introduce this resolution at the annual meeting of the House of Delegates of the American Medical Association at its annual meeting in 1948"

I move its approval as thus revised

DR. HAROLD B DAVIDSON I second it

There being no discussion, the motion was put to a vote and was unanimously carried

Section 109 (*See 21, 59*)

Introduction of President of the New Jersey State Medical Society

DR JAMES F ROONEY, *Trustee* I rise to a question of personal privilege I am informed that the President of the New Jersey State Medical Society is in the rear of the hall In respect and honor to the head of one of our sister societies, I would ask that the Chair appoint a committee to take him to the rostrum

VICE-SPEAKER STROHM Dr Cunniffe and Dr Kenney, will you please bring Dr Norton to the rostrum?

The delegates arose and applauded as Dr Edward R Cunniffe, Trustee, and Dr J Stanley Kenney, Councilor, escorted Dr James F Norton to the rostrum

VICE-SPEAKER STROHM Dr Norton, have you a word for us?

DR JAMES F NORTON Mr Speaker and members of the House of Delegates, in sitting in the back with Stan Kenney and Ed Cunniffe it sounded like it might be at Atlantic City this was going on They are the very same topics that are involved, the same fight with the Veterans Administration and what they promised to do, and, as far as we in New Jersey are concerned, what they did not do They left us high, wide, and not too handsome We spent a lot of money setting up a procedure for handling the Veterans Administration matter in New Jersey I don't know who pulled it from under us, but while I don't know whether it was Hawley, or whether it was Harding, it was somebody in New Jersey, and we are worse now than when we started

Then we hear you have your chiropractors in New York, the same as we do in New Jersey I thought we were the only ones who were plagued by chiropractors You apparently also have chiropodists You call them over here by a little different name than we do, you call them podiatrists, but we call them chiropodists in New Jersey

I am honored to be selected by the New Jersey State Society to bring you greetings, and to tell you seriously that we look to New York State for a lot of guidance in matters concerning the medical profession You are, of course, the most powerful, the most potent state organization in the entire country New Jersey just lies on the other side of the river, hemmed in on one side by your big State and on the other side by the other big state of Pennsylvania, so we do not have much to do except to look either to the right or to the left, and we like to look to the right (*Laughter*) So I seriously pray you that you deliberate with wisdom and continue to show us the kind of leadership and guidance we hope to get from such a fine august body as this House of Delegates (*Applause*)

Section 110 (*See 76*)

Report of Reference Committee on Report of Council, Part XII Nursing Education

VICE-SPEAKER STROHM Dr Geis, chairman of the Reference Committee on Report of the Council, Part XII, has a report to make We are still in executive session

DR JOSEPH A GEIS, *Essex* I don't know whether I dare stand up here again or not, I thought I would get shot this morning

This is the report of the Reference Committee on Report of the Council, Part XII, on Nursing Education

Your Reference Committee agrees with the Committee on Nursing Education in the efforts made to license qualified nurses by endorsement of license held in other states or in the Canadian Provinces

We firmly believe that there is a serious shortage of bedside nurses Since this morning we have learned that there is a commission studying nursing on the level of patient requirements As this commission is to make its report before the next session of the legislature, we make no recommendations at the present time This commission is independently financed We recommend that the Council Commission on Nursing Education strongly present the doctor's viewpoint that bedside nursing is of prime importance

We agree with the Council Committee that some of the shortage is due to the shortening of the work week We seriously question this ability of the average family to pay a living to either a nurse or anyone else for the ridiculously small number of hours they are now willing to work

We agree with the suggestion that the profession as a whole give thought to the nursing situation and suggest that, after due consideration, they write their ideas to the Council Committee for consideration

We realize that your Council Committee is in a difficult spot They must not only represent the medical profession and their patients but also must work with the New York State Hospital Association, the New York State Professional Nurses Association the Practical Nurses of New York and the State Education Department All of these organizations have their own ideas and often do not see eye to eye with us. This Committee deserves great credit for its share in keeping the Coordinating Council for Nursing Problems alive

I move the adoption of this report

DR. AARON KOTTLER *Kings* I second it

VICE-SPEAKER STROHM It has been regularly moved and seconded that this report be adopted Is there any discussion?

DR. WILLIAM B RAWLS, *New York* There is one word in there which I don t believe is necessary and it is just going to offend some people I refer to the word ridiculously small number of hours. I would suggest the deletion of the word "ridiculously and instead say the small number of hours

DR. GEIS On behalf of the Reference Committee I will be glad to accept that.

VICE-SPEAKER STROHM Is there any discussion on the report as amended and accepted by the Reference Committee?

The question was called and the motion was put to a vote and was unanimously carried

Section 111 (*See 64*)

Report of Reference Committee on Report of Council, Part XII The Report of the Temporary State Commission on Coordination of State Activities

Dr Strohm s resolution was thoroughly discussed item by item and was referred to the Council for consideration.

VICE-SPEAKER STROHM If there is no further business to come before the Executive Session we will rise and report.

DR. ROONEY I move that the Committee of the Whole rise and report, and after that motion is put I would like to have the privilege of making another

DR. E. P FLOOD *Bronx* I second that.

There being no discussion the motion was put to a vote and was unanimously carried

DR. ROONEY I now move we take a recess of five minutes before we reconvene as the House of Delegates.

DR. SAMUEL Z FREEDMAN *New York*. I second that.

There being no discussion, the motion was put to a vote and was unanimously carried

After recess the House of Delegates reconvened at 6 00 P.M.

SPEAKER ANDRESEN Members of the House, I have bad news for you We still have something like 15 or 16 reference committee reports to consider The discussion has been entirely too long this afternoon. I think it was important to have it, but I realized that this question was bound to arise when I asked you to have most of those arguments before the reference committees yesterday afternoon Now we have 15 or 16 more reference committee reports to consider and the question comes up what are we going to do I would suggest if we would keep on now until about seven o clock that we could possibly take up some of the reference committee reports tomorrow while the votes are being counted Tomorrow morning the election of officers is the first order of business, and while the tellers are busy counting, we could take up some more reference committee reports. My suggestion is that we continue for another hour until seven o clock otherwise the only thing we can do is to reconvene tonight at eight o clock and continue then until we get through which might be eleven or twelve o clock.

DR. JAMES F ROONEY, *Trustee* I would like to say this If we don t dispose of most of this business tonight, we are very likely to make some frightfully sad mistakes in trying to hurry a number of perhaps important reports tomorrow morning That was one reason why we instituted an extra day s meeting of the House of Delegates because of the many errors that were made by the House in hasty consideration of important reports I entirely concur with what the Speaker has said I know that I am going to have to break an engagement with my wife. We were going to the theater, but I would rather get this thing through and I think for the sake of the Society and the good of all of us we had better follow the Speaker s suggestion and carry on until seven, and at least clean up most of the deck so we don t do what I have seen happen so often at this last morning s session when many things have been done very unwisely

SPEAKER ANDRESEN All in favor of continuing until seven o clock say Aye , contrary "No " It is so ordered we will continue until seven o clock I hope by then we will be able to get through with a good many reports.

Dr Eggston has four or five resolutions that were referred to his committee and I think we will have to take those up now and get them over with

Section 119 (*See 53*)

Report of Reference Committee on Report of Council, Part IX Podiatry Legislation

DR. ANDREW A. EGGSTON *Westchester* This is another resolution on the Podiatry Bill introduced by Dr Samuel Gitlow of the Bronx

"WHEREAS podiatry is a technical minor adjunct of orthopedics and

I want you to notice that sentence.

"WHEREAS many systemic diseases have manifestations in lesions of the lower extremity and

"WHEREAS, the Institute of Podiatry is not a medical school and

"WHEREAS the licensed podiatrists have been active in attempting to pass legislation in this State to extend the limitations of their licensure and we have eliminated to include treatment of systemic diseases

"WHEREAS, the treatment of disease constitutes the practice of medicine under the laws of this State and

"WHEREAS the passage of such legislation would be detrimental and hazardous to the public health and welfare, therefore be it

Resolved that the Medical Society of the State of New York put itself on record as being opposed to such legislation and be it further

Resolved that the Governor and members of both Senate and Assembly be sent copies of this resolution and be it further

Resolved that the Legislative Committee and our Albany representative be instructed to govern themselves accordingly and be it further

Resolved, that the content of these resolutions be made known to the Board of Regents of the State of New York."

Your Reference Committee approves of this

resolution with the deletion of the first paragraph I so move.

DR EDWIN A GRIFFIN, *Kings* I second the motion

DR. JAMES F ROONEY, *Trustee* I move to substitute, if I may, that this whole matter be referred to the Council for appropriate and necessary action

DR LEO F SCHIFF, *Clinton* I second the substitute motion

DR FREDERICK W WILLIAMS, *Bronx* Is this House being put in the position where it cannot pass a directive to the Council?

SPEAKER ANDRESEN The motion is to refer this resolution to the Council Is there any further discussion?

DR ROONEY I don't see how the House can get any better directive to the Council than referring this motion and the report of the Reference Committee which embodies the content of the resolution to them Do what you want to, gentlemen, but the Council will have to take action on it anyway, and I am referring it to them for the necessary and appropriate action

DR. WILLIAMS I would like to

SPEAKER ANDRESEN Let me call your attention to the rule that you can only speak once on the same subject

DR. WILLIAMS But Dr Rooney discussed it

SPEAKER ANDRESEN He made the motion and he discussed it.

DR. WILLIAMS He discussed motions previously several times, in fact, not half an hour ago he discussed one motion four times I would like to ask does Dr Rooney's motion include that this is a directive to the Council?

DR. ROONEY I would like to have my friend when he speaks to address the Speaker If he wants to ask me a question, address the question to the Speaker I don't know whether I have permission to answer him or not because there are parliamentary rules that must be followed May I answer taking it as inferred that that is what was done?

SPEAKER ANDRESEN Yes

DR ROONEY You asked whether this is a directive to the Council I think that Dr Eggston quoted a directive to the Council, and my motion was that it be referred to the Council for the necessary and appropriate action Does that answer your question?

DR. WILLIAMS I second the motion

DR. THOMAS M D'ANGELO, *Queens* I think that Dr Rooney is making a substitute motion, and that it would have been better to have amended the original motion

SPEAKER ANDRESEN Dr Rooney's motion is to refer and was made as a substitute motion but is really a motion to refer

DR D'ANGELO While he made it as a motion to refer, he could have made an amendment to the motion that the matter be referred

SPEAKER ANDRESEN But he didn't He made a motion to refer

DR. ROONEY I want to get something in

DR. D'ANGELO What are we going to refer?

DR. M RENFREW BRADNER, *Orange* Did I understand that the first sentence was deleted?

DR. EGGSTON The Reference Committee recommended that it be deleted, and the motion as made by the Reference Committee is referred to the Council for appropriate action, as I understand Dr Rooney's motion

DR. ROONEY Right

DR. BURRILL B CROHN, *New York* What are we referring?

DR D'ANGELO I don't know what we are referring

SPEAKER ANDRESEN We are referring the report made by the Reference Committee, which includes the deletion of that first "whereas"

DR D'ANGELO Are we referring a motion to the Council?

SPEAKER ANDRESEN We are referring the matter concerned in the resolution

DR D'ANGELO Without any action by the House?

SPEAKER ANDRESEN It is a recommendation

DR ALFRED ANGRIST, *Queens* Point of information are we approving or disapproving this resolution? If we are referring this matter with the approval of this House, that is one thing, but if we are referring it to the Council with the inference that it carries no weight of approval or disapproval, I would be opposed to the motion made by Dr Rooney

DR ROONEY May I have the unanimous consent of the House for three seconds?

A motion to refer is a directive to the body of reference, parliamentarily At least that is the way I was brought up, though I have found it has all gone crazy lately We are supposed to be a parliamentary body The point is this The Committee recommended that the first sentence, as I recall it, be deleted I moved that the whole matter, including the deletion proposed by the chairman of the Reference Committee, be referred for necessary and appropriate action to the Council Now, if you will tell me that that does not mean approval and a directive to the Council, gentlemen, go ahead and argue it until half past ten tonight

DR. CHARLES GULLO, *Livingston* It seems to me that you approved everything else up to now or disapproved it Now Dr Rooney is asking that we refer this, which involves just the deletion of one small portion, to the Council It seems to me that this House of Delegates can decide now the appropriateness of whether we should delete that or not

SPEAKER ANDRESEN The House can if they decide not to refer it

Is there any further discussion on the motion?

DR EGGSTON This resolution is very similar to the one that we passed in 1947

DR. ROONEY I know

The question was called, and the motion was put to a vote and was carried

SPEAKER ANDRESEN It is referred to the Council

Section 118 *(See 42)*

Report of Reference Committee on Report of Council, Part IX Amendment of Hospital Lien Law to Include Physicians' and Surgeons' Bills

DR. ANDREW A EGGSTON, *Westchester* This is a resolution which has for its purpose the amendment of the Hospital Lien Law to include physicians' and surgeons' bills I don't know who presented it.

CHORUS Dutchess

DR. EGGSTON This may be a little more pleasant, I don't know It reads

> "WHEREAS, it is well known that physicians and surgeons treating automobile accident cases are unable, in many instances, to collect the payment due them for their services because the patient goes to his home in some distant community as soon as he is able to be moved, and settlement of his claim is often made without the physician being aware so that the aforesaid physicians and surgeons lose considerable sums of money with no redress, and

"WHEREAS the hospitals in which these cases are treated are protected by Section 189 of the Lien Law be it

Resolved that the 1949 session of the New York State Legislature be requested to amend Section 189 of the Lien Law to include the bills of physicians and surgeons for services rendered in the same cases as enumerated in said Section 189 of the Lien Law

Your Reference Committee approves of this resolution and I so move.

DR. EDWIN A. GRIFFIN, *Kings* I second the motion

There being no discussion the motion was put to a vote and was unanimously carried.

Section 114 (*See 41*)

Report of Reference Committee on Report of Council, Part IX Legislative Committee Activities

DR. ANDREW A. EGGSTON, *Westchester* On the resolution introduced by Dr Knickerbocker relating to Legislative Committee Activities reading

"WHEREAS, in addition to other expenses, for bills which did not pass through the office of the Executive Officer Dr Robert R. Hannon it cost the State Society $734.32 in 1946 $771 96 in 1947, and $918.50 in 1948 to conduct the annual conference of county legislative chairmen thus making the 1948 conference cost well over $1 000 and

"WHEREAS, the report of the Treasurer and Trustees indicates that unless we administer our available income on a more stringent basis there will again result a deficit and

"WHEREAS, while those conferences are interesting instructive, enjoyable and a definite social success they do not accomplish the purposes for which they were designed due to the apathy and negligence of the county legislative committees, and

WHEREAS reports read at the 1948 conference prove this to be a fact and

WHEREAS, unless these county legislative committees wake up take their assigned duties seriously and wholeheartedly support the Legislative Committee of the State Society and the Executive Officer Dr Robert R. Hannon their efforts in our behalf are bound to failure, and

"WHEREAS this resolution is not to be considered as any reflection or criticism of the State Society s Legislative Committee or Executive Officer Dr Robert R. Hannon and

WHEREAS, it would seem to be within the province of some executive division of the Society to institute such changes as may be indicated to the end that the component county societies will become an active integral part of the legislative program, therefore be it

Resolved that this matter be referred to the Council for consideration and institution of such measures as will make our legislative program an outstanding success

Your Reference Committee recognizes the increasing cost of the Annual Conferences of the County Legislative Chairmen. However it feels that the expenditure of a reasonable amount of the Society's funds is necessary and valuable if by judicious use of the monies the Committee can properly present and influence favorable legislation. Undoubtedly the amounts spent by opponents of the medical profession are many times what we spent for our Legislative Committee. It certainly behooves the chairman of each County Legislative Committee to take a keen interest in his position and usefulness to good medical legislation

These problems should definitely be referred to the Council for advice and action Your Reference Committee approves of this resolution I so move

DR. A. W MARTIN MARINO, *Kings* I second it.

SPEAKER ANDRESEN It has been regularly moved and seconded that this resolution be approved Is there any discussion?

DR. HOMER J KNICKERBOCKER, *Ontario* I may be ruled out of order, I don t know

Our Legislative Program is not accomplishing what it should Unless it can be better supported, it might as well be abandoned, save the cost, surrender to the chiropractors and all the other cults let them have it, lock, stock and barrel admit we do not care enough about what happens to put forth sufficient effort to save our necks.

This is not the fault of the State Society's Legislative Committee nor the executive officer in Albany The trouble lies in the county societies and their legislative committees Figures presented by Dr Hannon at the Legislative Committee Chairmen s Conference indicated that he received less than 20 per cent answers, for or against bills he sent out for comment. Of these, 2 per cent had no opinion Approximately 77 per cent of the county legislative committees made no reply

With such a showing it is no wonder that the members of the Legislature give us the brushoff

How can this be remedied? Reorganize the district branches If necessary redistrict the whole State. Have each district employ a full or part-time executive officer, working with the State executive officer and the Council Have him contact the county societies in his district thoroughly and often Bring the affairs projects, and desires of the state societies to the county level. In this way interest can be created and inadequacies corrected In other words take our problems to the grassroots and listen for the echoes. Keep eternally at it until we have what we should have, not only along legislative lines, but along other lines of effort.

The time has passed when "Let George do it' suffices. We must interview George personally and see that he acts as he should That costs money Where is it coming from? Let each district levy an assessment either direct or through the county societies Give them a free dinner at the meetings. Use the remainder for the program

There is an old saying that the way to a man s heart is through his stomach. Feed the brutes, and watch them flock to the cause. Until something of this kind can be developed, may I present a further suggestion If every delegate to this meeting will go home contact at least one legislative representative from his area, explain to him that the Medical Society of the State of New York is devoted to the health and welfare of the people as much as its own, we will get somewhere. Tell the legislators that next year we will introduce another bill aimed at the elimination of all kinds of quacks, and solicit their interest and support of measures sponsored by and/or approved by this Society If each of you will do this, it will be of great help in laying the foundation for better success in the legislature than we have heretofore been accustomed to.

The question was called, and the motion was put to a vote and was unanimously carried.

Section 115 (*See 57*)

Report of Reference Committee on Report of Council, Part IX Partnership and Group Practice

DR ANDREW A EGGSTON, *Westchester* I have here two resolutions that were introduced by Dr Aaron Kottler, but he had the titles of them mixed up, so in our writing them up we had to rearrange them One was on group practice and the other was on x-ray, but he had the title of the x-ray one on the group practice, and the title of the group practice on the x-ray In presenting these resolutions, it is up to the person who presents them to see they are done in the proper way, or at least I think it should be

On the one that we changed the title from "X-Ray as a Practice in Medicine" to "Partnership and Group Practice," it reads

"WHEREAS, the New York State Legislature enacted Senate Introductory 740 Printing 2142 in the 1947 Legislature which is now a chapter of the laws of 1947 of the State of New York, and

"WHEREAS, said law amends the Education Law in relation to the practice of medicine by physicians as partners and permits the pooling of fees and monies for medical services by the members of the partnership or group and employes of such partnerships or groups, and

"WHEREAS, said bill does not specify or limit the number of partnerships or groups to which an individual physician may belong, and

"WHEREAS, under the present bill, a physician might be a member of more than one group and use this as a subterfuge for the division of fees, and also create a situation where said member of more than one partnership might be tempted to render services for less than the agreed fee among the group, and

"WHEREAS, said bill permits a division of the fees with an employe who does not necessarily have to be a physician under the terms of the bill, therefore be it

"*Resolved*, that we request that legislation be introduced in the 1949 session of the New York State Legislature amending the recently enacted law concerning group practice or partnership, and incorporating therein provisions or amendments to correct the foregoing objections"

Your Reference Committee recommends that this resolution be submitted to the Council for action before the 1949 legislative session

DR. EDWIN A GRIFFIN, *Kings* I second the motion

There being no discussion, the motion was put to a vote and was unanimously carried

Section 116 (*See 86*)

Report of Reference Committee on Report of Council, Part IX X-Ray as a Practice in Medicine

DR. ANDREW A. EGGSTON, *Westchester* This is the second resolution submitted by Dr Kottler, and it refers to x-ray as a practice in medicine

"WHEREAS, a bill to amend Section 1250 of the Education Law of the State of New York in relation to practice x-ray diagnosis and treatment and treatment by radium was introduced in the 1947 legislature, which bill was not passed, therefore be it

"*Resolved*, that the Medical Society of the State of New York request that a bill be introduced in the New York Legislature in 1949 as follows

'X-ray diagnosis means that method of medical practice in which demonstration and examination of the normal and abnormal structures, parts of function of the human body are made by use of x-rays, and any person who holds himself out to diagnose or able to make or makes any interpretation or explanation by word of mouth, writing or otherwise, of the meaning of a fluoroscopic or registered shadow or shadows of any part of the human body made by the use of x-rays, and also the use of x-rays or radium for the treatment of any human ailment, shall be deemed to be engaged in the practice of medicine within the meaning of this article, and Section 1262 as follows The provision of this article shall be deemed to prohibit the practice of x-ray diagnosis, x-ray therapy, or radium therapy, as defined in subdivision 7A of Section 1250 of this chapter by any person other than a person licensed as a physician, a dentist, an osteopath, or a podiatrist'

Be it further

"*Resolved*, that the Medical Society of the State of New York actively work for the passage of this bill in the Legislature during the year of 1949"

Your Reference Committee approves of this resolution I so move

DR A W MARTIN MARINO, *Kings* I second the motion

DR THOMAS M D'ANGELO, *Queens* Do I infer from that that the maker of the resolution is trying to make a bill of that, which the Council will in some way or another have to implement, and that if the Council changes a word of that, as a result of its deliberations with the legislators, they are going to be censured? Here is an individual trying to write a bill I think the whole thing should be disapproved

DR WILLIAM KLEIN, *Bronx* I move it be disapproved

DR D'ANGELO I move it be tabled

DR. EDWIN A GRIFFIN, *Kings* I second the motion to table

DR. AARON KOTTLER, *Kings* Dr D'Angelo spoke, then he makes a motion to table You cannot speak on a motion to table According to parliamentary law all he can do is to ask for the previous question on the motion to table, but he cannot speak and make a motion to table at the same time

DR D'ANGELO I made my motion after I discussed it I did not make my motion to table before

DR. KOTTLER But that is out of order That is against parliamentary procedure

CHORUS No

SPEAKER ANDRESEN The other way around it would be, but this way it is in order

DR. WILLIAM KLEIN I moved we disapprove, and then he said I move to table

DR D'ANGELO The motion to disapprove was not seconded

DR KOTTLER I would like to be heard

DR D'ANGELO To facilitate matters I will withdraw my motion to table

DR KOTTLER I have nothing to say about this, as long as Dr D'Angelo withdraws his motion to disapprove this resolution

I am not attempting to write a bill This bill was written in 1947 by Assemblyman Clancy, and I am trying now to reintroduce that bill with certain corrections that caused the defeat of that bill in 1947

DR. LEO F SCHIFF, *Clinton* I think we could settle this in a moment if we were so minded, and I am going to ask the chairman of the Reference Committee if he does not feel that this would be a fitting

way to do it to give this subject matter with the approval of the Committee in principle and refer it to the Council for action?

SPEAKER ANDRESEN Do you accept that?

DR. EGGSTON I accept that.

DR. STEPHEN R. MONTFITH, *Rockland* I second it

SPEAKER ANDRESEN The motion is to approve in principle and refer to the Council for action Is there any further discussion?

The question was called and the motion was put to a vote and was unanimously carried

Section 117 (See 18 55)

Report of Reference Committee on Report of Council, Part IX Supplementary Report of Council, Economics—Amendment to Education Law, Section 6501

DR. ANDREW A. EGGSTON *Westchester* This is the last one. This was marked 'Economics' but it was handed to the Legislative Committee, and I will read it to you

"As a result of Report of Reference Committee on New Business B of the 1947 House of Delegates, a resolution concerning conditions governing the relationship between the hospitals and specialists of laboratory medicine in the State was referred by the Council to a Subcommittee of the Economics Committee This Subcommittee conferred with and had correspondence with representatives of the Joint Council of Pathologists, Radiologists Anesthesiologists and Physical Therapy Physicians. That body has recommended an amendment of the Education Law as follows

'Education Law

Section 6501 Definition.

'4. The practice of medicine is defined as follows A person practices medicine within the meaning of this article except as hereinafter stated, who holds himself out as being able to diagnose treat operate or prescribe for any human disease pain, injury deformity or physical condition and who shall either offer or undertake, by any means or method, *including the use and interpretation of radiographs fluoroscopic observations, prescription and administration of radiation therapy examination of human tissues or fluids physical therapy procedures and anesthesiology* to diagnose treat, operate, or prescribe for any human pain injury, deformity or physical condition' (Italicized phrases are new matter)

"Your Subcommittee recommends that the House of Delegates authorize the Council to request members of the 1940 New York State Legislature to amend the Education Law as above specified

This was signed by J Stanley Kenney M D Madge C L. McGuinness M D Theodore J Curphey, M D, Harold C Kelley M D, Ross Golden M D, M J Fein M D and Walter W Mott, M.D *Chairman*

Your Reference Committee approves of this amendment to the Education Law in principle I so move.

DR. EDWIN A. GRIFFIN *Kings* I second the motion.

DR. HARRY ARANOW *Councilor* Mr Speaker Ladies and Gentlemen, it is getting late and we are apt to pass through legislation which is going to be very damaging or resolutions that are not proper This is the nastiest thing that has been proposed so far today The Medical Practice Act of New York State is considered the best medical practice act in the country It took us a long time to be able to get it passed through the Legislature I see Dr Van Etten here and he will tell you what a long time it really was. I know for I had something to do with getting it over at that time You would never dare to open it without dire consequences. This thing would split it wide open and take the heart out of it. The definition of Medical Practice as now contained therein is excellent It covers every specialty It covers obstetrics it covers gynecology it covers x ray it covers anesthesiology Everything is included in the definition as it is now As soon as you begin to include the different denominations you weaken it. By the way when they are putting in these specialties there is nothing to prevent them to put in naturopathy—just one word—and the whole bill is dead.

I am firmly opposed to anything that will split the Medical Practice Act wide open the way this is proposed It is one of the most dangerous things we have suggested yet If they want bills to legalize x-ray or pathology or whatever it is, let them draw up the bill and give it to us and we will be glad to introduce it.

DR. JAMES F ROONEY *Trustee* I just wanted to add my word of approval to what Dr Harry Aranow has just said. That is what all the quacks are waiting for is for us to start to amend the initial paragraph in the Medical Practice Act, which is the definition of medicine At that very moment there will be motions by chiropractors, naturopaths osteopaths and the rest. You can wreck the bill if you force the Council and force the Legislative Committee to introduce this thing

I feel we should not attempt to meddle with this at present and I am going to move as a reference that the whole matter be referred to the Council for such necessary and appropriate action as they desire to take.

SPEAKER ANDRESEN Do you want to delete the approval in principle that they recommend and instead just refer it to the Council?

DR. ROONEY I will not even delete that, Mr Speaker I will refer the whole matter to the Council for necessary and appropriate action.

DR. WILLIAM KLEIN, *Bronx* I second it.

DR. MADGE C L. MCGUINNESS, *New York* Mr Speaker and fellow sufferers, I don t understand why just because we wish to define what is the practice of radiotherapy and what is the practice of pathology this should be treated like dynamite. What is the matter? Do we really amount to any thing? Is the Medical Practice Act for us and for the welfare of the public or is it just to give us a ball to throw around?

We have been trying to get some recognition Instead the gentlemen here talk like the hospital superintendents who say we are nothing but a lot of hospital hirelings and have no rights except as they give them to us.

After all are we specialists or not? Most of us have our boards. Are we physicians or aren t we? We have had to be trained as physicians and then we take up these specialties. If it were any other specialty everybody would be on their feet. I do not see why we four specialties are treated as we are We are physicians and we do a good deal of work in the hospitals, yet mostly it is the men in the other specialties who are opposed to us. I don t under-

stand that, and I can't understand Dr Aranow's idea that we are going to pull the Medical Practice Act to pieces by including these four specialties as the practice of medicine I don't understand why Dr Rooney feels that way either You will have to tell us something better than that Truly, any radiologist knows what he has to put up with, any pathologist knows what he has to put up with, and as for anesthesiology, they have been through enough trouble As for physical medicine, we are the worst off of the lot

Mr Speaker, I object very strenuously to the way this bill is being treated

DR. NATHAN B VAN ETTEN, *Past President* Mr Speaker and members of the House, it took us eight years to write the Medical Practice Act Over and over again we took out various parts during this procedure, and finally we were able with the assistance of a very strong committee of this body, in association with the New York Society of Medical Jurisprudence, very eminent lawyers and judges who gave this very clear and careful attention, to get it through As a matter of fact, not one step in that Medical Practice Act was created without the specific advice of a very distinguished lawyer We also had the clear mind of one of the greatest governors in New York, Mr Alfred E Smith, without whom the Medical Practice Act would not have been enacted

Let us not try any monkeying with the Medical Practice Act I believe very strongly that these specialties should be defined I am very much interested in that We are up against that problem all of the time I want very definite definitions of these specialists They are practitioners of medicine, and they are specialists, and they should be taken care of, but you must be exceedingly careful what you do, if you attempt anything at the present time that amends the Medical Practice Act of the State of New York, which is the best in the country

DR. THEODORE J CURPHEY, *Nassau* Despite the lateness of the hour I feel that it devolves upon me to discuss this motion I happen to be the President of the American Society of Clinical Pathologists this year and of course a member of the House of Delegates We feel very strongly about this matter Many of us have discussed it in the hospital, in the back rooms, and where have you There is a very definite question as to how the matter should be approached I admit that at the start of my indoctrination with the House here, I was entirely in favor of the approach that this motion specifies on the question of legislation giving recognition of the specialties After having knocked around with Dr Aranow and learned a few of the tricks of the legislative approach, I still feel as strongly as I did about the question, but I question seriously whether we can gain our desired ends by means of legislation Recently, it has been my studied opinion that it would be much better in the interests of medicine first, and certainly that of the four specialties, that the organized medical group consider our problem seriously and attempt to include us in their deliberations in these matters that concern our destinies I am not so certain it might not concern yours in the near future, especially if this matter of socialized medicine comes in I think that is happening I think the mere fact that as years go on the members of the four specialties are being registered by their county medical societies as having something to contribute to organized medicine, and as we are being sent in greater numbers to the House of Delegates is something I feel as Dr McGuinness does that time is running out, but apparently none of these problems can be settled by any hurried approach It appears that it is necessary to have long patience, but I want to say this, gentlemen, that while the grass grows the horse starves

DR ABRAHAM KOPLOWITZ, *Kings* I would like to be recognized, Mr Speaker

SPEAKER ANDRESEN The motion is to refer this whole matter to the Council for action Have you anything to add to that motion to refer?

DR KOPLOWITZ Well, yes, some little instruction to them It seems to me that this resolution covering something that I have been hearing now for the last fifteen or twenty years is going to accomplish nothing Why not face the facts as we know them? What we don't like is hospitals hiring these people, and not allowing them to practice That is not going to be changed by any legislation They are recognized now When they hire a pathologist, they know it is a doctor When they hire an anesthetist, they know it is a doctor Our fight is to stop them from hiring these men, and letting them practice as the rest of the profession do The legislation is entirely inadequate and will never reach it but may do harm as has been expressed

The question was called, and the motion was put to a vote and was carried

DR EGGSTON That is all I want to thank you all for your very kind treatment (*Applause*)

SPEAKER ANDRESEN Thank you, Dr Eggston.

I owe Dr Eggston an apology I hope that the Speaker next year will not refer so much to one man as we did to him this year I think he deserves great credit for what he has accomplished

I promised Dr Givan to listen to his report on Maternal and Child Welfare tonight

Section 118 (Sec 10)

Report of Reference Committee on Report of Council, Part II Maternal and Child Welfare

DR THURMAN B GIVAN, *Kings* Mr Speaker and members of the House, there were referred to our Committee some activities of your Child Welfare Committee during the past year

At the request of the New York State Department of Health a meeting of the Subcommittees on Maternal and Child Welfare was held in New York City on October 21, 1947 Members of the Council Committee on Public Health and Education, some of the officers of the Medical Society of the State of New York, and representatives of the State Department of Health were also present At this meeting the statement prepared by the New York State Department of Health regarding proposed pediatric consultation services was considered, as was the plan of the Department to have available obstetric films for postgraduate medical education

On November 12, 1947, a meeting of the Subcommittee on Child Welfare was held At this meeting the following statement prepared by the New York State Department of Health was approved by the committees

Statement Regarding Proposed Pediatric Consultation Services

The Medical Society of the State of New York and the New York State Department of Health agree on the principle that adequate pediatric consultation services should be available to general practitioners Such pediatric consultation services are primarily a technic of graduate education which will in the long run improve the quality of medical care to all the children of the State As such, it is of concern to the two organizations issuing this statement

Private practitioners should be encouraged to make greater use of pediatric consultation services. For patients who cannot obtain the needed consultation services, including indicated laboratory and x ray examinations such services should be made available to general practitioners through the instrumentality of the public health program on a regional basis radiating from a pediatric center Inasmuch as technics for providing such services have not been developed in detail it is proposed that a pediatric consultation program be instituted in a single region of the State on an experimental basis. Buffalo region has been selected for this experiment.

In the development of pediatric consultation services, major emphasis should be placed upon consultations for groups of patients in such locations that the needed laboratory and x ray examinations may be readily provided The referring physician is required and other physicians are encouraged to attend the group consultation In connection with such group consultations, teaching conferences and other educational devices should be arranged for the pediatric consultant. In view of the varying circumstances in each case, the referring physician must be the individual to determine if pediatric consultation service including indicated laboratory and x-ray examinations, is otherwise available to his patient.

Individual consultations by pediatricians have been provided to a limited extent as part of the public health program for many years. No change in policy in this regard is proposed.

At this meeting qualifications and duties of *consultant obstetrician* and *consultant pediatrician of* the Division of Maternal and Child Health of the New York State Department of Health were considered and the Committees will assist the Department in finding specialists to fill these positions.

Your Reference Committee recommends the acceptance of this report, and I so move.

DR. PETER J DI NATALE, *Genesee* I second the motion.

There being no discussion, the motion was put to a vote and was unanimously carried.

DR. GIVAN At the request of the New York State Department of Health a meeting of the Committee on Child Welfare was held in New York City on January 14 1948 The *Baby Book*, a publication of the New York State Department of Health was reviewed and *the Committee made suggestions* for changes.

The Department will include the following paragraph in the section on Acknowledgments at the end of the book 'The Council Committee on Public Health and Education the Subcommittee on Child Welfare, and other representatives of the Medical Society of the State of New York have reviewed *the Baby Book* and made many valuable suggestions They approved the use of the *Baby Book* for general public health education in New York State.

Your Reference Committee recommends the acceptance of this report, and I so move.

DR. EDWIN A. GRIFFIN *Kings* I second the motion.

There being no discussion the motion was put to a vote and was unanimously carried.

DR. GIVAN Next is the Supplementary Report concerning Child Welfare

A meeting of the Subcommittee on Child Welfare was held on March 10 1948, in New York City to discuss school health services in the State Department of Education The matter of most concern is securing a sufficient number of qualified physicians for full-time positions in the service A considerable number of suggestions for improvement in securing applicants have been submitted to the State Education Department

Another meeting of the Subcommittee on Child Welfare was held in New York City on April 6 1948 to discuss payment of consultation fees to specialists and general practitioners for services rendered to the Department and also a schedule of fees for laboratory procedures Those fee schedules were given general approval with the understanding that some changes may be recommended later

Your Reference Committee *recommends* the approval of the conclusions of your Subcommitttee on Child Welfare namely to obtain better school health services by securing a sufficient number of well qualified physicians for this service by paying them an adequate fee for services

I move the adoption of this portion of the report

DR. WILLIAM J ORR, *District Delegate* I second it.

There being no discussion, the motion was put to a vote and was unanimously carried

Section 119

Report of Reference Committee on Report of Council, Part II Diversion of Federal Funds for Pediatric Undergraduate, Graduate and Postgraduate Education

DR. THURMAN B GIVAN *Kings* The following resolution was introduced by Dr William J Orr of the Eighth District Branch, Medical Society of the State of New York

WHEREAS the American Academy of Pediatrics has now concluded a complete two and one-half year survey of pediatric education in all of the approved medical schools and the pediatric departments of all hospitals and of all other child health services including the care rendered by private physicians, state by state and county by county throughout the United States

WHEREAS this survey places the American Academy of Pediatrics in a unique position of knowing the facts related to the needs of child health services,

'WHEREAS, the Executive Board of the American Academy of Pediatrics has come to the conclusion that the first and most fruitful approach toward a national program for the improvement of child health must be predicated upon increasing and strengthening the teaching of pediatrics at the undergraduate graduate and postgraduate levels for general practitioners and pediatricians

WHEREAS a program for strengthening pediatric education will increase teaching budgets of medical schools and pediatric departments of hospitals which even now do not have adequate financial support,

WHEREAS the Executive Board of the American Academy of Pediatrics after due deliberation as to the availability of possible private sources of revenue has taken under consideration the use of Federal funds to assist these schools and hospitals in a program designed to further pediatric education

WHEREAS to this proposal for Federal funds has been added the requisite that such funds be allotted according to the judgment of nine representative pediatricians and without interference with the policies or internal affairs of the institutions concerned

"WHEREAS, the Executive Board of the American Academy of Pediatrics proposes to submit to the Congress a constructive program for child welfare based upon the findings of its survey, having thus gathered together the pertinent facts pertaining to child care and pediatric education, therefore be it

"*Resolved*, that the House of Delegates of the Medical Society of the State of New York approve the recommendation of the Executive Board of the American Academy of Pediatrics that Federal grants, such as are now available in other fields of medicine, be provided for training in the medical care and health supervision of children,

"*Resolved*, further that this resolution be introduced at the meeting of the House of Delegates of the American Medical Association in June, 1948"

Your Reference Committee approves this resolution for the following reasons

1 It is an effort to direct Governmental expenditure in support of medical education, rather than medical care

2 It offers an opportunity to develop a program in which federal funds for education are expended only on approval of a council representing organized medicine

3 The structure of this proposal is one that readily fits into an adequately safeguarded program in support of medical education in general

I move the acceptance of this report The Committee in deliberating over this quite at length asked certain members who have conducted this study from out of town to sit with us, and I would like to have the indulgence of the Chair to ask Dr John Hubbard, if he will, to give a few statements in regard to this subject of this latter resolution because he more than anyone else knows the intricacies of it He conducted the study for the Academy of Pediatrics

SPEAKER ANDRESEN Dr Givan invited Dr Hubbard up to the committee meeting, and we are very much pleased to have Dr Hubbard here If he would like to make a few brief remarks at this time, he may do so

DR. JOHN HUBBARD Mr Speaker and members of the House, I wish to thank you for extending to me the privileges of the floor I promise you that I will be brief in deference to the hour I think in a few moments I can correct some misapprehensions and perhaps some misunderstandings which may have come to your attention in relation to this measure

I heard, for example, this morning here at this meeting for the first time the statement that the Academy of Pediatrics in one of its reports stated that 90 per cent of general practitioners are not qualified to care for children I don't think that statement needs much comment except to say I am sure it was never made I certainly did not make it I don't believe it, and I don't believe any member of the Academy believes it I hope, therefore, that one can be dismissed as a rather absurd misrepresentation of facts

What we have said is from the factual information we have gathered that 75 per cent of the care of children is in the hands of the general practitioner He is the fellow that carries the load Any program, therefore, for the improvement of child health must necessarily depend upon the general practitioner The findings of the study of child health services are just now coming to light They were reported briefly at a preliminary meeting held a couple of weeks ago in Buffalo, at which there was in attendance members of the Child Welfare Committee of your State Medical Society, pediatric representatives of each of the twelve districts of the State Medical Society, chairman of the Public Health and Education Committee, and the secretary of your State Medical Society

One of the findings of the study which has been of most concern to us comes from the personal visits we have made to each of the approved medical schools throughout the United States We are gravely concerned with the inadequacies of pediatric education and of the inadequacies of financial support for pediatric education We are convinced that any program for the improvement of health services for children must begin at that point, with strengthening of pediatric education Here let me emphasize that when we say "pediatric education" we do not mean turning out more pediatricians or merely just giving better training to pediatricians, we are concerned with the physician who is carrying the load and is caring for the major part of the children, who, as I have stated, is the general practitioner This program is, therefore, essentially an effort to strengthen the hand of the general practitioner who is carrying the load for the medical care and health supervision of children

I wish to reiterate also, as was stated in the resolution, that in the event some measure for support of medical education in general should be developed favorably—and we emphasize that word "favorably"—then I am sure the American Academy of Pediatrics would be very glad to have its effort swing into that general stream

We are interested in medical education in general We are cognizant of the fact that any program for the improvement of medical education costs money We are hearing a good deal now of the crisis that is facing medical education That is not my word, "crisis" Those of you who may have attended the conference in February on Medical Education and Licensure in Chicago heard a great deal about the crisis in medical education I would refer you to several statements in the *Journal of the American Medical Association*, perhaps particularly to the May 1 issue, in which there is a good deal reported from that February meeting Therefore, any program to support pediatric education or general education must increase cost Hospitals and medical schools are now facing increasing deficits

Realizing these facts, we felt there was no recourse other than to recommend that improvement of education be handled through Federal funds, with the distinct understanding that this is something proposed by organized medicine, and that all grants for funds should be made only upon the approval of a council which we name, for lack of a better term, Council on Pediatric Education

Particularly, may I draw your attention to the wording that the recommendation is for Federal grants such as are now available in other fields of medicine, that they be provided also for the training in the medical care and health supervision of children In other words, there is now being spent under the United States Public Health Service $1,000,000 in teaching grants, especially earmarked for mental health, another $1,000,000 is being spent in teaching under the Cancer Program, the Children's Bureau is allocating through State health departments approximately $1,000,000 in support of teaching salaries These grants are not being made with the approval of any group representing organized medicine We propose in the further development of this program these grants should be

made with the approval of a council representing organized medicine.

If such a measure is conducted favorably, I think without question the medical profession will have taken a strong move toward the support of medical education rather than medical care

I have been rather interested to note that one of the sources of criticism which we have received in relation to this program is from those who believe that this program is a direct move against compulsory health insurance.

Thank you sir!

DR. THOMAS A McGOLDRICK, *Past President.* Hardly any physician would take exception to the objects of this report and the statements made by Dr Hubbard as the result of his study for the past two and one-half years Hardly any physician has an objection to the wider diffusion of knowledge, whether it is in pediatrics or in any other branch and with all of those objects and purposes of teaching in the medical schools better teaching in the hospitals, and increased knowledge obtained by the general practitioner I would, with everybody else be in full accord But there is one little point in there that with our experience of the years does not sound just as smooth nor as subtle as it might be the contribution of the Federal Government to parts of medicine

There may be ways in which that can be controlled but the person that gives the money in accordance with all of the practices of the United States retains a hold on them He advocates and makes standards That has been true in all of those branches venereal disease, tuberculosis and you remember what they wished for neuropsychiatric diseases of a few years ago when the Public Health Service asked to have the control of the diagnosis, the treatment, and hospital care of all of those cases and there were 51 per cent of all of the beds in the United States occupied by neuropsychiatric cases

I am sure that the United States Government will not, unless some new law is enacted turn over money and let a council of doctors take charge of the distribution of it They have not as yet done that We know what the government is doing with the doctors. We heard today about the Veterans Administration and what is happening there with the choice of private physician and how it worked out with the abrogation of the authorities.

Last April or July as our memories will serve $202 000 was paid for medical services and then as the new men came along by March of this year the total amount of services rendered by the medical profession as approved by the Government directive was $11 000 that will be directed properly into those government channels.

I feel that when the Government is going to give money to pediatrics either in schools or in methods to educate the general practitioner or in laying out plans for improvement in hospital services and their pediatric departments they will retain their hold by means of standardizing and directing and control of that money to be taken from or increased at any time by the Government itself While in hearty sympathy with all of the purposes and objects of the pediatric department I feel that unless there is some way in which money may be given for these purposes outright and free and clear of all government control, which is well nigh an impossibility—I mean Federal Government control—we should not approve of this under those circumstances

DR. JAMES F ROONEY *Trustee* There is an old maxim that he who pays the fiddler calls the tune. We have had our experience with it, and here so far as I know is the first time that the medical profession is going to the Federal Government and saying 'Give us money Our position in opposition to all of the plans for the nationalization of medicine and socialization of medicine immediately is broken down. Our argument breaks when we say we come asking for education and I dread to see the trend in education not alone medical but national uniform elementary and collegiate, placed in the hands of the Federal Government which is definitely what they want to do I have no trust in any of it. I have no confidence, particularly in the Social Security Administration

We know what happened during the war in relation to the obstetric provisions put out by the Children's Bureau We know exactly how false statements were made repeatedly by the director of that Bureau. We know that constantly every man who has had experience—if Dr Kosmak is here, he can state what the experience was with that—knows what happened

Gentlemen I hope that we will not. I would much rather we put on a begging campaign among ourselves I am in favor of more education of every sort but I am absolutely fearful at seeing the rate of conversion of this Government to a socialized totalitarian government being aided by ourselves

SPEAKER ANDRESEN Is there any further discussion?

DR. THOMAS M D'ANGELO *Queens* I would like to ask a question I would like to ask what department of the Federal Government is going to have the power to give out this money

SPEAKER ANDRESEN Do you want to answer that question, Dr Givan?

DR. GIVAN That has not been determined as yet because the money has not been asked for as yet. In the second place we have hopes that it will come through the Educational Department, but there is no way of knowing that particular thing

DR. ROONEY May I ask another question? Is this the first time that this resolution has been presented to any body of delegates of organized medicine? Is this, its presentation in this House the first presentation that has been made in the United States to organized medicine?

DR. GIVAN It is.

DR. D'ANGELO Since my question was answered I would like to make this motion that since this matter is in a continuous state of flux I move that it be referred to the Council for their study

DR. ROONEY I second the motion.

SPEAKER ANDRESEN The discussion now would be on the motion to refer the matter to the Council for study

DR. THOMAS F McCARTHY *Bronx.* I want to discuss the original motion.

SPEAKER ANDRESEN We are discussing the motion to refer

DR. McCARTHY I asked for the floor before that motion was put. I thought you were going to recognize me for you were looking right at me

SPEAKER ANDRESEN If you want to discuss the motion to refer please do so.

DR. McCARTHY Speaking for the Bronx County Delegation we are opposed to the original motion and we would also be opposed to the motion of referral to the Council on the basis that we are opposed to the request for Federal interference in education and the allocation of funds from the Federal Government, except with the consent and direction to the states and the local communities involved.

Secondly, there were a couple of other questions asked which shed much light on this subject, but when the speaker mentioned organized medicine, I think of organized medicine, as we do here, as being the American Medical Association, the state societies and the county societies, so we question whether nine men from, say, the Academy of Pediatrics, are representatives of organized medicine Therefore, we would even oppose the motion to refer to the Council

DR. ROONEY May I have the consent of the House for a moment? As I recall it, we were requested to introduce a resolution of this sort into the House of Delegates of the American Medical Association at their coming meeting with our approval of this plan Am I in error in that?

DR. GIVAN That is correct

DR. ROONEY Gentlemen, I still feel that instead of taking hasty action upon this thing that the motion to refer is absolutely correct I can assure this House that there will be neither hasty, nor untoward action, nor action in error, taken by the Council of your Society I hope the motion to refer will pass

The question was called, and the motion was put to a vote and was carried.

Section 120

Report of Committee of Whole

SPEAKER ANDRESEN There is one thing we have to do now We neglected before to get the report of the Committee of the Whole, which I am now going to ask for I am going to call on Doctor Strohm to report on the Committee of the Whole

VICE-SPEAKER STROHM This report will not be in detail for several reasons, but I will try to summarize the work that was done by the Committee of the Whole

The first business taken up was the Report of the Reference Committee on Malpractice Insurance and Defense Board by Dr Koplowitz The resolutions were some three in number Considerable information was given concerning the work that the Malpractice Insurance and Defense Board had done during the year We were favored with a very technical report by an actuary on the insurance problems involved, and it was recommended that the Board be continued

During the discussion of this report a resolution of Dr Wetherell's was also discussed, all of which recommendations and resolutions of this Reference Committee were approved

Dr Bauckus then reviewed the Veterans Administration activities that he is interested in as President of the Veterans Medical Service Plan, Inc , and as chairman of the Council Committee of Liaison with the Veterans Administration This was followed with a great deal of information, and the report was finally adopted as reported by Dr Bauckus

A discussion on cults was called for, and Dr Eggston, chairman of the Reference Committee on Report of the Council, Part IX, reported on some resolutions pertaining to cults that had been referred to his reference committee Dr Dattelbaum, chairman of the Subcommittee on Cults, gave us considerable information, and after a prolonged discussion the report of the Committee was approved That report was to disapprove some of these resolutions

Dr Eggston also reported as chairman of the Reference Committee on Report of the Council, Part IX, on the legislative report, and that was approved as read

Dr Rawls, chairman of Miscellaneous Business B Reference Committee, which dealt with certain changes in the American Medical Association's bylaws which seemed to sort of discriminate as to certain racial groups made suggestions for change of this bylaw, I believe it is Article 4, which was finally adopted as reported by him

Dr Geis, chairman of the Reference Committee on Part of the Council, Part XII, then reported concerning Nursing Education His final report was adopted by the Committee of the Whole

Dr Geis also reported on the Wicks' Committee recommendations with amendments, and the report of his reference committee was referred to the Council for proper action

I think that is all

Vice-Speaker Strohm moved that the report be accepted

DR JAMES F ROONEY I second the motion that the report be accepted

There being no discussion, the motion was put to a vote and was unanimously carried

DR. JAMES R. REULING, *Treasurer* Because there was a great deal of informative material as presented by Mr Linder, the actuary, who made the report, I would move that the report of the Malpractice Defense and Insurance Board and the discussion thereon, as well as the report of the actuary, be incorporated in the minutes of the House of Delegates in toto

DR. JAMES F ROONEY I second the motion that the report be accepted

There being no discussion, the motion was put to a vote and was unanimously carried

DR. CHARLES F MCCARTY, *Kings* I move that the reports of Dr Geis and Dr Rawls given during the executive session be printed in the minutes

SECRETARY ANDERTON Also portions of Dr Eggston's report

DR MCCARTY Yes

DR THEODORE J CURPHEY, *Nassau* I second the motion

There being no discussion, the motion was put to a vote and was unanimously carried

SPEAKER ANDRESEN I would like to announce that tomorrow morning at nine o'clock sharp we will have the election of officers We are going to have an awful lot of work still to do with reference committees, so if we don't get started promptly, we may not get through.

Dr McCarty asks me to have you all register for voting at the table when you come in

DR. MCCARTY The table outside

SPEAKER ANDRESEN Register outside at the table before you come in You must so register before you can vote We will start right on time tomorrow morning, at nine o'clock, so please be promptly in your seats at that time

This session is now adjourned

The session adjourned at 7 15 P M

Morning Session

May 19, 1948

The session convened at 9 00 A.M

SPEAKER ANDRESEN The House will be in order I have a few announcements to make The first is to again remind you to get your tickets for the banquet out in the hall

The second is to attend the technical exhibits

about which I have spoken to you before.

Third I want to announce a Council Meeting following immediately after adjournment of the House, and that is to be followed by a meeting of the Board of Trustees both in Rooms 111 and 112

Section 121

Elections

SPEAKER ANDRESEN We now come to elections of officers. Is there a quorum present, Mr Secretary?

SECRETARY ANDERTON Yes I believe there is

SPEAKER ANDRESEN Will the Secretary read the names of the tellers? We would like each teller to answer to his name. If he does not answer we will have to get another teller to act in his place because we want to get going right away

The following list of tellers was finally appointed

Charles F McCarty *Chairman Kings*
Irwin Nelson *Allegany*
Charles L. Pope, *Broome*
Samuel Gitlow *Bronx*
Alexis Leonidoff *Dutchess*
Edwin A Griffin, *Kings*
Charles Gullo, *Livingston*
Eugene H Coon, *Nassau*
B Wallace Hamilton, *New York*
Arthur F Gaffney *Oneida*
James Greenough *Otsego*
Donald R McKay *Erie*
Porter A. Steele, *Erie*
Norman S Moore, *Tompkins*
John J Gainey *Kings*
Reginald A. Higgons, *Westchester*
Frederick W Williams, *Bronx*
Teresa McGovern, *New York*
Harold B Davidson, *New York*
Moses Krakow, *Bronx*
Louis Berger *Kings*
Peter M Murray, *New York*
Howard Dodds, *Oneida*
W Alex Newlands, *Westchester*

SPEAKER ANDRESEN Will these tellers, whose names were just read off as soon as they are through voting, go through the door to the side where they will reach the bridge, and where the votes will be counted

Section 5 of Chapter III of the Bylaws provides

'In the event of a single nominee only for any office a majority vote without ballot shall elect.'

The Chair will entertain a motion in such case for closing the nominations and declaring the candidate elected. That will save us some time

The ballots will be distributed. They are to be filled out only with the names where there are any disputed offices, where there is more than one name nominated, and in the case of the delegates to the American Medical Association we have to vote for ten, but twenty names will have to be presented

NOMINATIONS AND ROLL CALL

Nominations were received

Assistant Secretary Frey read the following list of those who were entitled to vote

OFFICERS COUNCILORS, AND TRUSTEES

Louis H Bauer
Leo F Simpson
Ralph T. B. Todd
W P Anderton
W Guernsey Frey Jr

Treasurer, James R Reuling, *Bayside*
Assistant Treasurer, Fenwick Beekman, *New York*
Speaker, Albert F R Andresen, *Brooklyn*
Assistant Speaker, Nelson W Strohm, *Buffalo*
Trustee for Five Years, Albert A Gartner, *Buffalo*
Trustee for Two Years, Edward T Wentworth, *Rochester*
Councilors, O W H Mitchell, *Syracuse*, Maurice J Dattelbaum, *Brooklyn*, Dan Mellen, *Rome*

ELECTION OF A M A DELEGATES

The following were elected 1949–1950 delegates W P Anderton, *New York*, Albert F R Andresen, *Brooklyn*, James R Reuling, *Queens*, Floyd S Winslow, *Monroe*, Herbert H Bauckus, *Erie*, O W H Mitchell, *Onondaga*, Thomas M Brennan, *Brooklyn*, Ralph T B Todd, *Westchester*, Albert A Gartner, *Erie*, William B Rawls, *New York*

The following were elected 1949–1950 alternate delegates Edward P Flood, *Bronx*, Leo F Schiff, *Clinton*, W Guernsey Frey, Jr, *New York*, B Wallace Hamilton, *New York*, Clarence G Bandler, *New York*, Denver M Vickers, *Washington*, John L Edwards, *Columbia*, John T Donovan, *Erie*, Walter T Heldmann, *Richmond*, Eugene H Coon, *Nassau*

Section 122

Election to Honorary Membership

SECRETARY ANDERTON Mr Speaker, the following letter has been received from the Officers of the Medical Society of the County of Kings under date of April 20, 1948

Dear Doctor Anderton

In accordance with your letter of April 16 we as members of the Medical Society of the County of Kings and Academy of Medicine of Brooklyn wish to recommend Dr Robert F Barber of Farmingdale New Jersey to Honorary Membership in the Medical Society of the State of New York

Dr Barber was an active member of the Medical Society of the County of Kings from June 20 1911 to December 31 1947 and was elected to Honorary Membership in the Society on February 17 1948 He resigned from active membership December 31 1947 when he moved to Farmingdale New Jersey where he now resides

Very truly yours
A W Martin Marino
Charles H Loughran
Charles F McCarty

This is nominating Dr Robert F Barber to perhaps one of the highest honors that we can pay any member in our profession

DR MAURICE J DATTLEBAUM, *Kings* I move it

DR EDWIN A GRIFFIN, *Kings* I second it

SPEAKER ANDRESEN It is open for discussion It requires a two-thirds vote I believe, Mr Secretary?

SECRETARY ANDERTON I would have to look that up

SPEAKER ANDRESEN I am sure it does

There being no further discussion the motion was put to a hand vote and was unanimously carried

SPEAKER ANDRESEN Dr Robert F Barber is declared elected an Honorary Member

Section 123

Transfer from Retired to Active Membership

SECRETARY ANDERTON A letter was received from Dr G B Gilmore, secretary of the Bronx County Medical Society, under date of April 28, 1948, reading

Dear Dr Anderton

Dr William Hinz 1882 Grand Concourse who was made a retired member of the State Society in 1941 returned to the practice of medicine this year

Will you kindly request the House of Delegates to rescind the action on this retirement and replace Dr Hinz s name on the active membership roster

Sincerely yours,
G B Gilmore, M D
Secretary

I move, sir, that the retired membership accorded to Dr William Hinz be rescinded and that he be returned to active membership in the Society

DR. G B GILMORE *Bronx.* I second it

There being no discussion, the motion was put to a vote and was unanimously carried

SPEAKER ANDRESEN He is declared elected back to regular membership

Section 124

Election of Retired Members

SPEAKER ANDRESEN We now have the election of a number of Retired Members

SECRETARY ANDERTON First there is a letter from the Officers of the Medical Society of the County of Kings, under date of April 21, 1948 reading

Gentlemen

This certifies that Dr Walter D Ludlum, Sr of 169-30 116th Avenue St. Albans Long Island New York, is an honorary member in good standing of the Medical Society of the County of Kings He was an active member for over forty years 1901 to 1942 and in 1931 was President of the Society

He is hereby applying for Retired Membership in the State Society

Yours very truly
A. W Martin Marino M D
President
Charles H Loughran, M D
Secretary

Mr Speaker, it gives me pleasure to nominate Dr Walter D Ludlum Sr for retired membership in our Society Dr Ludlum was for years a member of this House and has not only been an active member in the doings of the State Society but has been very active in his county society for a lifetime I feel he deserves retired membership if anybody does

DR. FREDERICK W WILLIAMS, *Bronx.* I second it.

There being no discussion the motion was put to a vote and was unanimously carried

SPEAKER ANDRESEN Dr Walter D Ludlum Sr is declared elected a Retired Member

SECRETARY ANDERTON Mr Speaker I move that the dues of the following gentlemen for 1947 be remitted

Ernest M Fuld *Bronx*
Alfred W Jackson *Albany*
Frederick M Miller *Utica*
Augustus B Santry *Little Falls*
Albert Van Vranken, *Skaneateles*
Charles L. Wakeman, *Hancock*

I make that motion because they would then be eligible for election to retired membership I think their dues for 1947 have not been paid Unless they are paid or rescinded by the State Society they would not be eligible for retired membership

DR. STEPHEN H CURTIS, *Section Delegate* Is it proper to add another name to this list at this time?

SECRETARY ANDERTON I believe nominations for retired membership and requests for rescinding of dues come properly from a county society Doctor, and I don t believe that an individual has the right to do that I am not quite positive, but that would be my feeling that such a suggestion would have to be voted on by the local comitia minora.

DR. JAMES R REULING *Treasurer* I second the motion

There being no discussion, the motion was put to a vote and unanimously carried.

SPEAKER ANDRESEN These men are now eligible for retired membership

SECRETARY ANDERTON Yes.

SPEAKER ANDRESEN We now have to vote on a list of members who are proposed for retired membership which is published in the *Bulletin*, so we won't waste time reading the whole list as much as we would like to hear their names It is on page 6 in your blue book, but there are more to be added, in addition to the six names that Dr Anderton just gave as follows

Gerard H Cox *Saranac Lake*
Angelo D Alfonso *Pasadena California*
Gilbert D Dare, *Plattsburg*
John Dugan *Albion*
John R. Evers, *Wentworth New Hampshire*
Frank O Garrison, *Campbell*
John D George, Sr., *Verona*
B Cordelia Hathaway *East Greenbush*
Charles E. Haynes, *New York City*
George H. Humphreys *Jamaica*
Frank H Hurst *Schenectady*
Arthur M Johnston *Utica*
Israel O Kassow *Bronx*
Melchiore Lombardo *Brooklyn*
Herman F McCheeney *Forest Hills*
Abraham Pezzler *Bronx*
William B Roemer, *Utica*
John F Timpee *Richmond Hill*
Casilus H. Watson *Brookfield Center Connecticut*
Floyd E. Woodhouse *Elmira*

If there is no objection on the part of the House the members whose names are listed in the book, with the additions I have just read and those read by Dr Anderton whose dues have just been rescinded for 1947, will be declared elected Retired Members Hearing no objection, it is so ordered

The complete list referred to is as follows

Ralph N Abels *Jersey City New Jersey*
Jules Leon Blumenthal, *New York City*
George T Boychoff *Solvay*
Paul B Brooks *Altamount*
Charles M Burdick, *Plattsburg*
Charles F Collins, *New York City*
Gerard H. Cox *Saranac Lake*
Hugh M Cox, *New York City*
Nelson A Craw *Fo kald C nnecticut*
Angelo D Alfonso, *Pasadena Cal fornia*
Gilbert D Dare *Plattsburg*
James C. Davis *Rochester*
Willard J Denno *New Yo k City*
Francis E. Du Bois, *Winter Park Florida*
John Dugan, *Albion*
Thomas F Dublieg, *New York City*
Henry Bage Dunning, *New Canaan, Connecticut*
Simon D Ehrlich, *New York City*
John R. Evers, *Wentworth, New Hampsh re*
Charles A. Falton *Syracuse*

Henry C Williamson *New York City*
Floyd E Woodhouse *Elmira*

Section 125

Remarks by President-Elect

SPEAKER ANDRESEN It is now my great pleasure to present to you a couple of your new officers I will ask Dr McGoldrick if he will escort Dr Masterson to the rostrum

The delegates arose and applauded as Dr Thomas A McGoldrick escorted Dr John J Masterson to the rostrum

DR JOHN J MASTERSON, *Kings* It is very difficult on an occasion of this kind to refrain from making other than trite remarks, but I do want you to know that the Medical Society of the County of Kings and I feel highly honored, deeply appreciative, and sincerely thankful for your confidence and trust in electing one of its members to the highest office at your command in the second largest medical society in the world

The world is in a state of flux, and so is medicine We have many problems confronting us, and we will have those problems in the future To the solution of those problems we should bring the best statesmanship and wisdom at our command My long association with this House has made me very cognizant of the responsibilities and duties of this office They are beyond the capabilities of any one man I approach them with deep humility, and I hope with the helpful assistance and cooperation of this House, the Council, the Board of Trustees, the other officers, and our very efficient office staff to be able to carry on in a manner comparable to the high standards set by my distinguished predecessors in this office

I thank you very much

Section 126

Remarks of Vice-President

SPEAKER ANDRESEN I will now ask Dr Bauer to present Dr Curphey, our new vice-president

The delegates arose and applauded as Dr Louis H Bauer escorted Dr Theodore J Curphey to the rostrum

DR. THEODORE J CURPHEY, *Nassau* As I understand it, in any democracy the vice-president is usually expected to sit by and say little I propose to adopt the same policy I shall try to be a good Throttlebottom

Section 127

Report of Prize Essay Committee

SPEAKER ANDRESEN We will now have the Report of the Prize Essay Committee, of which Dr Chas Gordon Heyd is the chairman Dr Anderton will read Dr Heyd's report

SECRETARY ANDERTON Dr Heyd had to go, so he asked me to read the report of the Prize Essay Committee Of the two essays submitted this year, neither was felt to be worthy of the prize However, one was felt to be deserving of honorable mention, the one by Ex Obscuris Lux, Dr Sylvan Bloomfield The other paper submitted, "Parotid Body Tumors," there was no comment upon

SPEAKER ANDRESEN This is for our information Is the chairman of the Scientific Awards Committee here?

There was no response

SPEAKER ANDRESEN Dr Post was supposed to have a report this morning of the prizes awarded for scientific exhibits We will probably hear from him later on

Section 128

Vote of Thanks to Scientific Program Committee Also Scientific Exhibits, Convention, Program and Arrangements Committees

DR JOHN B D'ALBORA, *District Delegate* I am sure this House of Delegates appreciates the very fine program that the Scientific Program Committee has given us under the chairmanship of Dr Duncan Clark Mr Speaker, I move that we give Dr Clark and his Committee a vote of thanks for the splendid work they have done

The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

PRESIDENT BAUER It seems to me that in that vote of thanks we should also include the chairman of the Scientific Exhibits Committee, Dr Hiss, the chairmen of the Convention, Program, and the Arrangements Committees, as well as the others that have made this program a success I would move that they also be given a vote of thanks from the House

SPEAKER ANDRESEN I had that all provided for

The motion was seconded, and as there was no discussion it was put to a vote and was unanimously carried

SPEAKER ANDRESEN We will now have an opportunity to get back to our Reference Committee Reports We still have many reports to listen to

I wish now to call the attention of the House to the arduous tasks performed by these committees At my suggestion, practically every one of their chairmen studied the reports upon which they were to re-

port, when they were published in the April 1 issue of the JOURNAL, wrote out tentative reports and sent them to the members of their committees for comments, so that they could give more time here to hearings and to new reports and resolutions referred to them Several of these committees met a week or two in advance of the meeting to get their reports in order Some asked for outside help at their deliberations Their excellent reports yesterday showed the good results of this preparation, and we hope for even better results next year

The few reports which held us up yesterday were due to the fact that the Council Committee reports had not been presented on time and we hope that this will not occur again next year

In spite of all of this preparation the many important matters which were discussed so lengthily yesterday have given us a tremendous backlog of reports still to be considered. We may be busy well into the afternoon It has become evident that there is too much work in the House to permit us as doctors to take part in the scientific work of the meeting It has been suggested that, like the American Medical Association we have an interim session in the winter so that we will not have so much work at the annual session This would require an amendment to our bylaws and in order to have an amendment to the bylaws it is necessary for an intention to amend the bylaws to be presented at *this* time.

I believe Dr Rooney wishes to have the privilege of the floor which requires a two-thirds vote on this day I will call for a show of hands to permit Dr Rooney to present this motion to facilitate our meetings in the future.

There were no negative votes cast.

SPEAKER ANDRESEN Dr Rooney you have the floor

Section 129

Notice of Intention to Amend Bylaws to Provide for one Extra Meeting of House Each Year

DR JAMES F ROONEY *Trustee.* I hereby give notice that I propose to amend the bylaws to provide for one additional meeting of the House of Delegates in each year I will present the written notice and the proposal before the closing of this session

SPEAKER ANDRESEN This constitutes a notice of the proposed *amendment which will have to be* published one month before the next annual meeting in order to be adopted at that meeting

Section 130

Advisability of Holding Special Meeting of House in 1948.

SPEAKER ANDRESEN I would like to ask Dr Rooney now whether he would make a motion requesting the Council to consider the advisability of calling a special meeting of the House next winter It will have value to us now to know the feeling of the House in regard to such a meeting.

DR. ROONEY I will be very glad to make the motion, Mr Speaker, but I am not a member of the Council, and I think it might be well perhaps to have that notice given or at least have my motion seconded by a member of the Council I am just on the Board of Trustees.

DR. FLOYD S WINSLOW *Councilor* I will second it.

SPEAKER ANDRESEN *Is there any discussion?* That does not require any amendment to the by laws.

DR. ROONEY That is right.

It was put to a hand vote and was unanimously carried.

SPEAKER ANDRESEN This is merely a suggestion to the Board of Trustees and Council to consider the matter and it is the sense of the House apparently that we are in favor of such a meeting

Are there any other matters to come up before we go on with the Reference Committee Reports?

There was no response.

SPEAKER ANDRESEN If not, we will continue with the Reference Committee Reports.

Section 131 (*See 44 79*)

Report of Reference Committee on Report of Council Part XI Publication of Articles on Subject of Medicine

DR. THEODORE J CURPHEY *Nassau* Your Reference Committee has considered the resolution submitted by Seneca County in connection with the resolution adopted by this House at its 1947 Convention directing all members to seek official approval of the Society for the publication of any article on the subject of medicine written by a member of the Society for the lay press whereby it considers such a motion a forthright violation of the basic principles of free speech and freedom of press Your Reference Committee consulted with the *Chairman of the Reference Committee on Report of* the Council Part XII who will report on the joint action of this motion

That part of the resolution of Seneca County petitioning the House to expend its energy in the matter of censoring publications in the direction of those individuals who write pseudoscientific papers which are misleading or contrary to established scientific truths, or whose articles are dedicated to the purpose of tearing down the traditions and the high standards of our profession, was also considered by your Committee. It expresses its sympathy with the views expressed therein, but feels that it is beyond the jurisdiction of this Society to take action on *this part of the motion*

I move the adoption of this part of the report.

DR. FREDERICK S WETHERELL, *Onondaga* I second the motion

There being no discussion, the motion was put to a vote and was unanimously carried

Section 132 (*See 16 17 133 134*)

Report of Reference Committee on Report of Council Part XI Directory

DR. THEODORE J CURPHEY *Nassau* On discussion with members of the Publication Committee and review of their report in the NEW YORK STATE JOURNAL OF MEDICINE of April 1 1948 and their supplementary report of May 12 distributed at this meeting, certain facts emerged

1 That the new edition of the *Directory* will not be ready until about January 1949

2 That the deficit sustained in the 1947 *Directory* was $59 395

3 That the estimate for the coming volume is in the neighborhood of $63 000

In view of the foregoing facts and others that need not be discussed at this time It is the recommendation of your Reference Committee that in the interests of economy of operation, following the next edition of the *Directory* a subsequent edition be published at no more frequent an interval than two years

I move the adoption of this part of the report.

DR JAMES F ROONEY, *Trustee* I second it

There being no discussion, the motion was put to a vote and was unanimously carried

Section 133 (*See 16, 17, 132, 134*)

Reports of Reference Committee on Report of Council, Part XI Publication of the "Journal"

DR THEODORE J CURPHEY, *Nassau* Your Reference Committee in conference with the Publication Committee of the JOURNAL, in the short time at our disposal, was impressed with the complexities of the problem of publishing a scientific periodical in these times of rising costs and economic uncertainty In view of these facts your Reference Committee would move a vote of thanks to the Publication Committee, and would further assure them of our confidence in their efforts on behalf of the Society In passing, too, your Committee would like to comment them for their independence and clarity of thought that now characterizes the editorial policy of the JOURNAL At this point your Committee would further recommend the continuation of this body in the ensuing year, as established by previous motions of this House

I move the adoption of this part of the report

DR PETER J DI NATALE, *Genesee* I second it

There being no discussion, the motion was put to a vote, and was unanimously carried

Section 134 (*See 16, 17, 132, 133*)

Report of Reference Committee on Report of Council, Part XI Scientific Medical Advertising

DR. THEODORE J CURPHEY, *Nassau* The question of scientific medical advertising in the JOURNAL was next considered by your Committee The supplementary report recently issued by the Publication Committee was carefully studied, along with Dr Bauer's comments from the floor of the House thereon The Committee was further favored by the appearance of both Dr Bauer and of members of the Publication Committee, at which time a very frank and friendly discussion of this matter ensued

As a result of this, and from a consideration of these reports, certain facts are obvious

1 In the mechanism of publication certain errors are bound to appear at rare intervals

2 The rules and regulations of the Council on Pharmacy and Chemistry of the American Medical Association may at times be considered as arbitrary, and thereby might tend to exclude desirable advertising of products of proved clinical merit

3 The Reference Committee approves the principle of the Publication Committee in preserving an independence of approach in keeping with true democratic policy

As a part of the deliberations of your Committee on this matter it took the opportunity of canvassing the opinion of the professor of pharmacology of one of the New York medical schools, seeking information as to the approach of the Council on Pharmacy and Chemistry in the past and advice as to a policy for the guidance of the Publication Committee in this very troubled question of scientific medical advertising

Based on the foregoing your Committee would like to recommend that, for the purpose of making the tasks of the Publication Committee less onerous, an advisory committee be formed, comprising members of the clinical group coupled with pharmacologists trained in the clinical and research approach, with the avowed purpose of assisting in the evaluation of products prior to their acceptance for advertising in the JOURNAL

We further respectfully suggest that the following policy be established

1 That Council-approved preparations be accepted without question for advertising in the JOURNAL

2 That all other products submitted be passed upon by the recommended advisory committee

3 That the final responsibility of acceptance or rejection should rest entirely with the Publication Committee

4 That advertising other than that falling in the scientific field be not included in the purview of this report, but be left to the discretion of the Publication Committee

Finally, in connection with this entire matter of scientific medical advertising, your Reference Committee would like to go on record as disapproving the editorial of the A M A of February 7, 1948, as being unwarranted, unjustified, and in decidedly poor taste

The Reference Committee further moves acceptance of the Public Relations report, and would recommend a vote of thanks to that Committee for their excellent work in our behalf

I move the adoption of this part of the report

DR JAMES F ROONEY, *Trustee* I second it

There being no discussion, the motion was put to a vote and was unanimously carried

Section 135 (*See 89*)

Report of Reference Committee on Report of Council, Part XI Premature Publicity of Medical Matters by State Officers

DR THEODORE J CURPHEY, *Nassau* On the resolution introduced by Dr Alfred Angrist of Queens, "Premature Publicity of Medical Matters by State Officers"

> "WHEREAS, it has been the policy for governmental agencies in the past to promote press releases on the expansion of services and the introduction of new programs which involve the physicians of the community when the cooperation of the local physicians is both desirable and necessary,
>
> "WHEREAS, subsequent discussions of modification of the projected program to render it effective and efficient improperly places the physicians in the light of obstructing such expansion of services to the public, therefore be it
>
> "*Resolved*, that the Medical Society of the State of New York go on record as advising the interested governmental agencies that the Medical Society of the State of New York is always ready to conduct preliminary discussions about such projects which involve medical service and the allied branches of activity of the government, before press releases are promoted on such matters"

Your Reference Committee approves the principle of this resolution

I move the adoption of this part of the report

DR EDWIN A GRIFFIN, *Kings* I second the motion

There being no discussion, the motion was put to a vote and was unanimously carried

Section 136 (*See 90*)

Report of Reference Committee on Report of Council, Part XI State Expansion of Laboratory and Diagnostic Services

DR THEODORE J CURPHEY, *Nassau* On the

second resolution introduced by Dr Alfred Angrist of Queens entitled 'State Expansion of Laboratory and Diagnostic Services

WHEREAS the question of expansion of diagnostic facilities including laboratory work BCG and x-ray studies is contemplated throughout the city and State of New York and

WHEREAS it is the considered opinion that existing facilities are in need of more adequate staff and funds therefore be it

'*Resolved* that the Council state its willingness to appoint representatives familiar with these services who, together with the Health Department of the City and State of New York study the entire problem with a view of adequately staffing existing facilities before considering the expansion of such facilities.

Your Reference Committee approves this resolution and further suggests that members of the Section on Pathology and Clinical Pathology of the Medical Society of the State of New York and members of the New York State Society of Pathologists be selected to sit in with any committee concerned in a discussion of this matter

I move the adoption of this portion of the report

DR. EDWIN A GRIFFIN *Kings* I second the motion.

DR. ALFRED ANGRIST *Queens* For the record may I just say at this juncture that I think it was the purpose that this not be interpreted as representing opposition on our part to such extension of services by State authorities or city authorities, including diagnostic services of all sorts but that we be understood by this resolution to imply that we are in favor of such extension however that (1) the existing services be rendered at peak efficiency and (2) that in extending such services we make haste slowly At least the fear exists among some of our colleagues that the rapid extension of such services has potential dangers in it and abuses are easily manifest as evolving in the rapid appearance of such a program some of them approaching the equivalent of State medicine.

We therefore feel that study of such policies is in order and that their extension should be a gradual one and not imply the immediate application of a program over a large area.

DR. SAMUEL Z FREEMAN *New York* I would like to ask a question of Dr Angrist Does that also refer to the extension of these services in the City of New York?

DR. ANGRIST Yes, the resolution was presented in the broad form to include all such services by State and city officials.

DR. FREEDMAN Then I would like to discuss and lead up to an amendment because within the last three weeks or so there has appeared in the newspapers of this city that the Departments of Hospital and Health have taken it upon themselves to extend these services of a similar nature without making it clear to me at least, whether or not these services are to be available to all the people of the City of New York or whether they will be limited to the medically indigent I think at this point it is very important, therefore, to clarify the issue whether or not we tacitly approve that these services be extended without being recorded that we favor these services to be extended only to the medically indigent. Therefore I would amend the resolution to read that we approve of the extension of these services to the medically indigent

DR. STEPHEN H CURTIS, *Section Delegate* I second the amendment.

SPEAKER ANDRESEN Is there any discussion of the amendment?

DR. THOMAS M D ANGELO *Queens* So far as the Department of Hospitals in the City of New York is concerned, those services would be open only to indigents. As far as the Department of Health is concerned anyone can step into a Department of Health agency whether he is a pauper or a millionaire, and ask for that service

SPEAKER ANDRESEN Is there any further discussion of the amendment?

DR. JAMES F ROONEY *Trustee* I think that we should announce a policy that covers not alone a section of the State or a part thereof but the whole State What we recommend should apply to New York City and upstate just as well. I am very glad to hear this discussion this morning pointing out the fact, as Dr D Angelo has just said that any person can step into, let us say, any of these survey groups for radiographs and the like irrespective of means or anything of the sort There has been a great deal of advertising in the common press of group examinations extended to the whole population in a certain area upstate within the last three weeks. It seems to me that that is just the way State medicine begins. We have had this gradual encroachment over a period of thirty five years It had been gradual, and it is accelerating therefore I feel that the recommendation made by the committee is an excellent one I don't intend to propose an amendment but I do hope it will be made coextensive for the whole State and not simply be limited in reference to one portion of the State.

SPEAKER ANDRESEN It does apply to the whole State doesn't it, Dr Curphey?

DR. CURPHEY That is my understanding of it, but the problem is more peculiarly that of New York City I take it.

CHORUS No

SPEAKER ANDRESEN Is there any further discussion of the amendment?

DR. WILLIAM B RAWLS *New York* In all fairness to what has been said about the Department of Health I would like just to state a few things for your information We have had a meeting with the Commissioner of the Department of Health, and it is not true that he proposes to take in everyone. He has no policy set, and before any policy is set he has promised that he will take it up with the five county medical societies in New York. I happen to have had a meeting with him at which Dr D Angelo was present, and we know he does not propose to go ahead yet, and he has no policy set. Neither does the Commissioner of Hospitals. The Commissioner of Hospitals has said he would limit it only to the medically indigent the Commissioner of Health said he would like to do the same thing As to what he is going to do that is what we had the meeting about one week ago That is only for your information

DR. ANGRIST On the amendment I do not feel the amendment is necessary because of the recommendation of the Reference Committee to refer the resolutions for study That would cover any singular proposition that is included in the amendment. Of course in the study the question of the indigent and the means test would be easily encompassed I think the purpose of the resolution is precisely what Dr Rawls has mentioned in this discussion. At the meeting that I had the privilege of attending, the Commissioner of Health said specifically that he did not favor a means test for these cases

DR ROONEY That's the point

DR. ANGRIST Therein lies the rub It may be very proper that the means test is below the dignity of the citizens of our State However, some precaution is necessary The only precaution suggested thus far has been that no such patients would be given treatment, which includes treatment or diagnosis, unless recommended by a physician Gentlemen, in my own experience that has always proved inadequate, because our own physicians are too loath to forget the welfare of their confreres in the specialized services I feel that we should just leave the resolution as it is It has no action It merely calls for an opportunity of study All we are doing, in effect, is to enter upon the books the fact that we are willing to cooperate in this matter, but that the cooperation should consist in observing a pilot group, a test group, to see how it works out, how far the abuses will go, how far politics will enter into it Those are the features to determine before we give our endorsement This does not imply an endorsement It implies a willingness to cooperate and to see how this thing will work out I would be in favor of opposing the amendment and favoring the original resolution

DR. SAMUEL B BURK, *New York* May I take this opportunity to discuss the amendment? While we are about to study this situation I believe that there is no harm, just as Dr Rooney has indicated that it is important that we guide the committee or guide those who are going to undertake this study by a policy of this body indicating that we are in favor of looking after our indigent Whether or not anything will come out of that, just as Dr Angrist stated, from the standpoint of study, that is another matter, but I believe that we should go on record indicating our own policy

SPEAKER ANDRESEN Is there any further discussion of the amendment?

DR ANGRIST May I—

SPEAKER ANDRESEN Please do not discuss again, Dr Angrist I think we will have to stick to the rule that only one discussion by a person is allowed on any matter, otherwise we will never get anywhere

Is there any other discussion by anybody else in regard to including that clause pertaining to the indigent?

The question was put to a vote, and the amendment was carried

SPEAKER ANDRESEN Is there any discussion on the report of the Reference Committee as amended?

The question was called, and the motion was put to a vote and was carried

DR CURPHEY I move you the adoption of the entire report, as amended

DR. SAMUEL B BURK, *New York* I second the motion

There being no discussion, the motion was put vote and was unanimously carried

SPEAKER ANDRESEN Thank you, Dr Curphey! I think in the interests of fairness I should refer to the Reference Committee reports in the order in which we have them If there is any person interested in having a particular one brought up earlier, I would like to hear it, otherwise I think in the interests of fairness we will take them in the order in which they are listed

DR JAMES F ROONEY, *Trustee* There is one very important report, and that is the one concerning the War Memorial I am afraid it is going to require considerable discussion, though perhaps not, because it involves what this Society desires to do by way of the expenditure of a considerable amount of money There is a serious question as to how that money shall be raised, and I feel that that report being so important should at least not be relegated to the last hours of the session when men are tired and many things may be done that they may be very sorry for within a year

SPEAKER ANDRESSEN If there is no objection, we will take up Dr Henry's report first

There was no dissent expressed

Section 137

Report of Reference Committee on Report of Council, Part VIII War Memorial

DR J P HENRY, *Monroe* Your Reference Committee has carefully considered the report of the special committee on a War Memorial This report suggests the establishment of an educational fund for the children of members of the State Society who died while in the armed services during World War II and outlines several plans for such a fund if established The report contains exhaustive statistical data on the subject, and the members of the Committee are to be complimented on the thoroughness of their work

Your Reference Committee approves the idea and the recommendation of the establishment of such a memorial fund, by means of a special assessment to be levied on the membership of the Society We approve the recommendation that the monies accruing from this assessment be placed in a special investment fund by the Board of Trustees, to be kept separate from all other funds of the Society and to be disbursed solely on order of the Council or a special committee thereof, within the provisions of the plan suggested

We recommend the adoption of the suggested Plan III, reworded as follows

"Plan III

"To each beneficiary covered by this Memorial Fund there shall be made a contribution of $600 per annum, beginning on completion of secondary (high school) education and continuing while the beneficiary pursues a collegiate and/or a professional postgraduate course, up to the age of 25 years, if he or she remains unmarried The amount of this annual contribution shall be changed only by vote of the House of Delegates The Council shall be authorized to care for cases of special educational need arising in the secondary (high school) level within the limitations of the available funds"

The cost of this plan, as estimated by the Committee on War Memorial, would be approximately $224,000

We approve the recommendation of a special assessment of not to exceed $12 per member to cover this cost

We recommend that, on completion of the purpose of this Memorial Fund, the unexpended balance, if any, be disposed of, in accordance with the vote of the House of Delegates at that time

I move the adoption of this portion of our report

DR MARGARET JANEWAY, *New York* I second it

SPEAKER ANDRESEN The adoption of this report is open for discussion

DR. LOUIS H BAUER, *President* I would like to ask for a point of information, Mr Speaker How is this assessment to be levied? Is it to be one assessment? I assume that is the case because I don't think the House can commit further houses

DR. JAMES F ROONEY, *Trustee* May I answer, Mr Speaker?

SPEAKER ANDRESEN You may

DR. ROONEY Yes, the committee recommended that the monies be raised by a special assessment The estimated special assessment for Plan III would be $12 for each member of the Society Much discussion was had concerning whether or not this assessment could not be made payable over a period of some years Under the Constitution and Bylaws no House of Delegates can commit the Society to a special assessment except for the duration of the life of that House

Then gentlemen in addition to that the figures arrived at in this were that an investment trust be created because we are not going to reach the summit of the demand for the expenditure of money until about 1954 to 1958 and that summit of demand will then continue for a period of approximately nine years. We will not amortize the whole affair provided that all of these children live until approximately 1968 That is the reason why your Committee recommended that the money be raised by one assessment invested by the Board of Trustees, with the proceeds of the return on that investment accruing to the fund That essentially is the point, but the assessment if it be levied must be levied at once and in one year

SPEAKER ANDRESEN Is there any further discussion?

DR. BENJAMIN M BERNSTEIN *Kings* I am a member of the Reference Committee which discussed this thing yesterday or the day before at quite some length, and I should like to say that Dr Rooney and his Committee did a remarkably fine job at gathering material and data, which we per used for several hours before we came to our conclusions

There are 58 children involved I think you should know some of these facts. These 58 children come from all over the State. A breakdown by this committee was very detailed as far as number of school years and the like. There were three plans proposed—I hope Dr Henry forgives me for entering upon the discussion instead of his doing it.

SPEAKER ANDRESEN May I interrupt and say that those plans have all been published We have all had an opportunity to read them If you have any particular comment to make concerning any of them, please do so

DR. BERNSTEIN No I have none at all except to say that I don t think we need to discuss the necessity for the War Memorial You have acted upon that in the past. The assessment has been placed at a level of $12 in order to supply the needed funds Although there may be some available when we are finished with spending the fund as the resolution stated that remainder may be used at your discretion

DR. FREDERICK W WILLIAMS *Bronx* I would like to raise the question for the consideration of the Reference Committee as to just the technic of collecting this special assessment. Who will send out the due notice of the special assessment? I think that should come directly from the State Office to the member to let him know that this a special assessment to the War Memorial of the State Society and not be collected through the counties

DR. ROONEY Will the chairman of the Reference Committee yield for a moment?

DR. HENRY Surely

DR. ROONEY If you approve this resolution, gentlemen, that we institute such a fund, after that is approved then a separate question must be raised and that is how the necessary assessment to carry out the purposes of the House shall be put into effect. According to the Constitution and Bylaws that assessment must be made upon each member and notice must issue with the notice for the dues payment for that year that a special assessment is assessed against each member by the State Society for that specific purpose and that specific purpose alone So that notice will have to go out in that way Dr Williams if you vote favorably upon the adoption of this Plan III

DR. JAMES R. REULING *Treasurer* I would just for the sake of the record like to pose the question if a man does not pay his dues he is dropped for nonpayment what if a member does not pay the special assessment?

DR. ROONEY He is also dropped

DR. REULING I take it that the action of the House would mean that he was dropped for non payment of dues?

CHORUS Correct

DR. REULING I think that should be clearly understood in the discussion of this motion

DR. ROONEY May I again encroach upon the time of the House but briefly to get this thing settled? The Constitution and Bylaws are specific. They stated that every member to retain his membership in the State Society and in any county society must have paid all of his dues and assessments or he will be dropped for nonpayment of dues or assessments That is all

SPEAKER ANDRESEN Thank you!

DR. BENJAMIN F GLASSER, *Queens* Mr Speaker and members of the House of Delegates I would be the last one or should be the last one to be accused of not wanting to put up a War Memorial of some sort for the veterans I say that because I have been in the armed forces in both world wars so I have a right to say it. I am not opposed to the resolution nor to the question of putting up a memorial but I think sometimes we go the whole way and more than the whole way when a problem arises and in this case I think we have gone too far

Offhand as I understand it we will take a child who has entered the second or third year of high school and begin to support him until the age of twenty-five That means a total period of about ten or eleven years I know we mean well but I don t think that is showing good sense. If the party needs support we should be here and ready and able and willing to give it, but to take these children and push them through college and medical school and all other sorts of things from the time when they don t even know what it is all about I think is not the best policy

For that reason I think the whole subject should be studied, including the assessment, so that we as members know more about it than the report given to us this morning

DR. ROONEY May I ask again that Dr Henry yield because I think I can answer my friend? I believe he has misconstrued to a large degree the whole situation.

SPEAKER ANDRESEN Will you yield?

DR. HENRY Yes.

DR. ROONEY This question has been lying fallow in the House for nearly three years In fact, since 1945 when it was first proposed. There is no question of supporting these children as a matter of fact the proposal is not even going to pay the cost of their medical education, nor is it going to pay the full cost of their collegiate education If my friend had read the report of the Committee, the supplementary report as distributed he would find that we

only allow $600 a year Well, the Committee felt that they would make that contribution rather than providing they would pay the full cost of the children's collegiate or medical education, in order that these children should have an incentive to do something for themselves It is not going to support them

You will also notice that in every one of these plans it was stated if they remain unmarried We felt there might be some opportunity of, well, persons of both sexes who would sort of have a feeling that here they had this thing guaranteed to them and they could marry and carry on for a year or two and then drop out This support will terminate the moment they leave college or the moment that they leave school, if they go to medical school

It seems to me, gentlemen—and I can say the same thing that the preceding speaker said, except I happen to have been a veteran of three wars instead of two—and I have a very keen feeling that sometimes being a veteran is used as a means of getting a handout If you had read some of the letters that I have had in response to the Committee's questionnaire—pathetic—a widow with four children working to support that family and trying to keep the children in school Another from a mother whose daughter is in her first year in college, and she wonders if she could have some assurance because if she cannot have some assurance of some additional support, the girl is going to have to leave college this year I stated in my report that if the House wishes to hear any of these facts, I have them all verified, and I will be glad to read them, but I don't want to take up the time of the House unless they want to have this done Gentlemen, it is a worthy object

DR HOMER J KNICKERBOCKER, *Ontario* I would like to ask if it is cumulative, and is it mandatory to be paid to the individual or may he leave it and let it accumulate for later use?

DR ROONEY May I again reply? I am sorry, gentlemen, but if this report of the committee had been read these questions would not arise It is specified in the report, the original report of the committee, every question that has been asked here is provided for in that report which you all received four or five days ago, including the supplementary report giving the plans When you speak about allowing it to accumulate, no The collection of the money if you so provide will be mandatory because it will be a State assessment The report states that we recommend, and Dr Henry has stated that in the recommendation of the Reference Committee, it be placed in an investment fund, the proceeds of which will accumulate in the fund, but that that money cannot be expended except by the direction of the Council or a committee thereof as the need arises upon each child attaining the age of seventeen or upon finishing high school, as provided in Plan III That is all provided for Is there anything further, Dr Knickerbocker?

DR. KNICKERBOCKER Specifically, if the individual, the student, will not need that this year, is it mandatory for him to draw it, or if he wishes can he lay it aside for another year, or is that administered by the committee that is in charge of the fund?

DR ROONEY May I answer?

DR HENRY Yes

DR ROONEY The point of fact is that we felt that it was not alone derogatory to the memory of these men who died in the service to require a means test, but that this was to be provided for all of these children, not upon request, but when they attain the age of seventeen or had finished high school—and the original report says whichever is later—that they shall then be eligible It must be by application This list will remain in our files We have the questionnaire with all of the ages and everything of the sort that will go into the custody of the Secretary of the Society No money can be dispensed unless the Council requests the Board of Trustees to authorize the expenditure, let us say of $1,800, to provide for the beginning collegiate education of three of these children at $600 a year each, so I hope that answered your question

DR. KNICKERBOCKER It has

The question was called, and the motion was put to a vote and was carried

Section 138 (See 26)

Report of Reference Committee on Report of Council, Part VIII Hospital and Medical Care for Veterans

DR JOSEPH P HENRY, *Monroe* Your Reference Committee considered the resolutions referred to it and reports as follows

Concerning the resolution introduced by Dr Aranow for the Council regarding Veterans Administration with requests for action by the American Medical Association

"WHEREAS, the Medical Society of the State of New York believes that veterans who have been injured or disabled in the service of their country are entitled to the highest type of medical and hospital care, and

"WHEREAS, Point Seven of the Ten Point National Health Program of the American Medical Association on 'Veterans' Need for Hospital and Medical Care' reads

'A program for national health should include the administration of medical care, including hospitalization, to *all* veterans, such medical care to be provided preferably by a physician of the veteran's choice, with payment by the Veterans Administration through a plan mutually agreed upon between the state medical association and the Veterans Administration',

and

"WHEREAS, no differentiation is made in the above-mentioned program between veterans suffering from illness or disabilities incurred in or aggravated by military services and those veterans suffering from illness or disabilities not incurred in or aggravated by military service, and

"WHEREAS, the present policy of the Veterans Administration is to furnish medical care and hospitalization to veterans whose illness and disabilities were not incurred in or aggravated by military services only when such veterans are not able to 'pay the necessary expense of hospital care' and when ' a bed is available in an existing facility', and

"WHEREAS, the Veterans Administration has neither the legal right nor the administrative machinery to investigate affidavits on financial ability of such nonservice-connected cases ' to pay the necessary expense of hospital care', and

"WHEREAS, nearly two thirds of the beds in Veterans Administration Hospitals are now filled with patients with nonservice-connected disabilities, and

"WHEREAS, the Veterans Administration now has 126 hospitals at a cost of over one billion dollars, and

"WHEREAS, the Veterans Administration currently has over 5,000 beds closed because of in-

ability to obtain personnel without lowering the standards of medical care and

'WHEREAS, the unlimited expansion of Veterans Administration hospitals will lead to an inferior grade of medical and hospital care for veterans, and at the same time injure the quality of hospital service that is available for the entire population by draining professional and technical personnel away from hospitals which serve the public as a whole be it

Resolved that the Medical Society of the State of New York, in view of the foregoing, instruct members of the House of Delegates of the American Medical Association to request at the next regular session of the House of Delegates of the American Medical Association that action be taken to amend Point Seven of the Ten Point National Health Program of the American Medical Association on Veterans Need for Hospital and Medical Care to read

'A program for national health should include the administration of medical care including hospitalization, to all veterans *currently entitled to such medical care and hospitalization under existing Federal statutes* such medical care to be provided preferably by a physician of the veteran's choice with payment by the Veterans Administration through a plan mutually agreed upon between the state medical association and the Veterans Administration

and

'*Resolved*, that the House of Delegates of the American Medical Association be requested to go on record as favoring Congressional action to interpret the following requirements of admission of nonservice-connected cases to Veterans Administration Hospitals

'1. The ability to pay the necessary expense of hospital care and

'2. ' if a bed is available in an existing facility and

'*Resolved*, that the House of Delegates of the American Medical Association at their next meeting be requested to go on record as favoring a definite ceiling on the number of beds to be provided in Veterans Administration hospitals and that such a ceiling be placed at 140 000 beds the number already authorized by Congress.

We approved this resolution and recommend its adoption and I so move

DR. BENJAMIN M BERNSTEIN *Kings* I second the motion.

SPEAKER ANDRESEN It has been regularly moved and seconded that this portion of the report approving the resolution be adopted Is there any discussion?

DR. FREDERICK S WETHERELL, *Onondaga* The word 'facility may be misconstrued Does that mean a veterans facility as they used to call them or does that mean an existing hospital in the locality? The word facility ' may be misinterpreted

SPEAKER ANDRESEN I think that usually applies to a Veterans Administration hospital or clinic doesn t it?

DR. JAMES F ROONEY Is Dr Bauckus here?

There was no response.

DR. ROONEY He is the chairman of the Committee, but I am the *vice-president of our* Plan. The word 'Veterans Administration facility is a general term they use for everything in connection with the Veterans Administration especially as regards local agencies.

DR. LOUIS H BAUER, *President.* I am in thorough sympathy with this. I feel, however that we should be very careful as to the wording of it because if there is an opportunity somebody will hop on the medical profession saying they don t want to take care of the veterans or we will antagonize the American Legion, etc. If we adopt this resolution, I would move that we amend it by adding that the final wording of this resolution be gone over very carefully in the Council so we may be sure that its final wording will be one that cannot be misinterpreted as to our intent.

DR. ROONEY Are you going to move that this go to the Council that this be referred to the Council with such amendment?

DR. BAUER I am moving that the final wording of it be left to the Council.

DR. ROONEY That it be referred to the Council for relieving any ambiguity in language?

DR BAUER Yes.

SPEAKER ANDRESEN Will you restate your motion?

DR. BAUER The motion is we accept in principle but the final wording be left to the Council to determine.

SPEAKER ANDRESEN That is an amendment to the original motion of the Reference Committee

DR. BAUER That is right

DR. ROONEY I will second it

There being no further discussion the amendment was put to a vote and was unanimously carried

SPEAKER ANDRESEN Now we have the original motion as amended Is there any discussion?

The question was called, and the motion was put to a vote and was unanimously carried

Section 139 (See 68)

Report of the Reference Committee on Report of Council, Part VIII Veterans Administration

DR JOSEPH P HENRY *Monroe* We now have a *group of resolutions introduced by Dr Bauckus for* the Liaison Committee with the Veterans Administration

Resolved that the Medical Society of the State of New York reaffirm its endorsement of a program that will give the veteran the best medical and hospital care attainable

Your Reference Committee approves of this, and I move its adoption.

DR. BENJAMIN M BERNSTEIN *Kings.* I second the motion

There being no discussion the motion was put to a vote and was unanimously carried.

DR. HENRY The second reads

Resolved that any new contract entered into by the Veterans Medical Service Plan, Inc. shall provide for the free choice of physician for the veteran Exceptions to this rule to be made only by mutual agreement by an appropriate committee of the two parties

We approve this, and I move its adoption.

DR. EDWIN A GRIFFIN *Kings* I second the motion

DR. ROONEY 'I would like to amend that language too because that is rather ambiguous. I would like to amend it in this way and I move this as an amendment for the last sentence that any exceptions to this provision —is that your language Dr Henry?

DR. HENRY "Exceptions to this rule to be made only by mutual agreement by an appropriate committee of the two parties.

DR. ROONEY Exception to this rule shall be made only by conference and appropriate agreement between the Veterans Medical Plan of New York, Inc , and the Veterans Administration

SPEAKER ANDRESEN Will you accept that amendment?

DR. HENRY Yes, I believe the Reference Committee would have no objection at all to accepting such an amendment, and I will accept it

The question was called, and the motion was put to a vote and unanimously carried

DR HENRY Number 3 reads

"That the fee schedule be a State-wide schedule approved by both parties and subject to change in specific instance by mutual agreement"

We approve that recommendation, and I move the adoption of that portion of the report

DR. ROONEY Mutual agreement of the same parties noted in the preceding paragraph?

SPEAKER ANDRESEN Would you accept that, Dr Henry?

DR. HENRY Yes, we approve that and recommend its adoption

DR. THOMAS A McGOLDRICK, *Past-President* I second it

There being no discussion, the motion was put to a vote and was unanimously carried

DR HENRY Number 4 reads

"That the State Medical Society disapproves of part-time employment of its members in any capacity which shall forbid the private physician from practicing medicine outside of assigned hours, including the care of veterans on a fee basis"

Your Reference Committee approves of that, and I move its adoption

DR. THOMAS A. McGOLDRICK, *Past-President* I second that

There being no discussion, the motion was put to a vote and was unanimously carried

DR. HENRY Number 5 reads

"That there are or have been regulations which deny, to former part-time or full-time physicians resigning from the Veterans Administration, the privilege of caring for veterans on a fee basis system for a period of two years following the physician's resignation, excepting only the physicians removing to a distant locality We condemn such interference as un-American in its abrogation of individual rights, a negation of the free choice principle, and a dictatorial bureaucratic device which limits and obstructs medical service to veterans, at the same time serving as a penalty to physicians, in many cases veterans themselves"

We approve of that, and I move its adoption

DR. HARRY ARANOW I second that

DR. ROONEY Once, again, Mr Speaker, that rule was put into effect very largely because abuses were happening Many young medical officers in a number of localities in the State took on temporary positions with the Veterans Administration, and due to the fact that they were assigned as authorizing agents for the Veterans Administration they acquired a very large group of men, veterans, applying for domiciliary care who got to know them very well, and after they had four or five months in these jobs they would arrange it so and suggest to these men—and this has come under my own observation—they were leaving the Veterans Administration but they could take care of them, because they were going to go into the private practice of medicine

We had one instance in the middle of the State where one man who went into the Veterans Administration as an employe, and I think he remained in the employment of the Veterans Administration for approximately five months and then left it, and within the first six months after he had left the Veterans Administration he had been paid something in the neighborhood of $16,000 for caring for veterans who were authorized to him That was when the rule went into effect that no man in part-time employment of the Veterans Administration and no man who was doing domiciliary care for veterans would be allowed to be paid any more than $6,000 a year In my opinion it is a just ruling Those were some of the things that got us in bad with the Veterans Administration, because at the time we had no means of stopping this sort of thing The $6,000 limit was the primary thing that did it, and, just as soon as the cream was out of the coconut, in this one particular instance, the gentleman has departed to take postgraduate courses as he stated openly on the basis of the around $20,000 he got out of the Veterans Administration on this sort of thing within the period of less than a year and a half

I feel that the language of some of this should not go into effect because you notice it means a two-year lapse I think that is too long It should be something like six months rather than two years We can object to the two-year rule I do not feel, however, that we should use the word "arbitrary" We are going to have to renegotiate a contract with the Veterans Administration or abandon our Plan, and that contract renegotiation is going to have to be made before August of this year I see no reason why we should unnecessarily antagonize the Veterans Administration, although I do feel that since General Bradley and General Hawley have left the Veterans Administration and the new regime has taken over there is a studied effort on the part of the Veterans Administration to revert to the rotten sort of stuff that we had from 1920 on until Bradley and Hawley came in I feel that that is the story, and that that language should be changed However, Dr Bauckus is now in the House, as I see, and I think perhaps he may want to say something about it But I feel we should change this and not use the word "arbitrary" because I don't believe they are arbitrary in this, though they are arbitrary in other things that they are doing that are not embodied in this However, I would like to hear what Dr Bauckus has to say about the matter

DR HERBERT H BAUCKUS, *Past-President* In the first place anyone who is licensed to practice medicine in the State of New York has that right I don't want to be a party to anything that interferes with the rights of a practitioner of medicine That is the fundamental point in this resolution

Secondly, if we made any changes in this resolution we would do something to remove free choice of physician, which you have approved in Resolution Number 2

If it so happens that a veteran has been a patient of the physician while he was employed by the Veterans Administration and he makes the choice to have him continue to take care of him, I want him to be able to do that I don't see how we can do anything else unless we change our principle of free choice

The third thing about this is that when they in various areas of the State put this into effect, by the way, without our knowing about it until we found out instances, they made exceptions, and pretty soon the exceptions were very general, so the regulation did not mean so very much after all

The next thing about this question of how much the doctor may earn in a year this $6 000 limitation if there is anything wrong about any physician s method in receiving money it should be brought to the attention of the Coordinator in that area, when it will be brought to the Board of Directors attention I told you that everything has been done to insure a smooth working relationship As I said yesterday, every time there has been a complaint an investigation was made. I did not tell you yesterday that of late months there has been a great effort to put much of this former fee basis practice on a contract basis That is true I am sorry to say and I could read you a list of 20 institutions and groups in New York State who are now accepting cases from the Veterans Administration on a contract basis Many of them are neuropsychiatric, but there are other kinds of cases involved too so that is a way as I see it of getting around our free choice principle While they have designation and they also have the $6 000 limit, still a man in the contract business can get *all that is sent to him* and *there is no limitation* in the amount of money he shall get

When they talk about the excessive costs of the fee basis system, I want to point out that in these contract cases relating particularly to neuropsychiatry the doctor under our Plan is paid $10 an hour In most of these contracts it costs $11.50 to $12 an hour The only difference I can see is that it is taking it away from the free choice principle and the fee basis system and putting it under a contract system which is certainly against our principles. That is one of the most discouraging things that I have found Therefore I say let us not have any interference at all with our free choice principle, and let us not have any interference with the private practice of medicine as we are wont to carry it on in New York State.

Dr. Louis H Bauer, *President* I would like to move an amendment to this Number 5 The first sentence I think is all right There are or have been regulations which deny to former part time or full time physicians, resigning from the Veterans Administration the privilege of caring for veterans on a fee basis for a period of two years following the physician s resignation excepting only the physician s removing to a distant locality and stop there and delete the rest of it and substitute the following "That the House of Delegates requests the Veterans Medical Service Plan Inc. to enter into negotiations with the Veterans Administration to obtain modification of this rule in such manner as to protect the rights of the Veterans Administration and at the same time to prevent discrimination against ethical physicians.

Dr. Rooney I second that

There being no discussion the amendment was put to a vote and was unanimously carried

Speaker Andresen The resolution as now amended is before you for discussion

The question was called and the motion was put to a vote and was unanimously carried

Dr. Henry Number 6

That we support the American Hospital Association in its stand against the building of veterans' hospitals beyond the present-day requirement that we favor free choice of hospital by the veteran in the service-connected case whether the selection be a veteran community or a private hospital that the expansion under the Hill Burton plans would provide additional hospital facilities enabling the veterans to choose and have care in their own localities that as far as can be ascertained at present, if the proposed plan for construction of 92 additional veterans hospitals is carried through the bed capacity of those hospitals together with those already existing under the Veterans Administration will be over twice the calculated bed needs for the next fifteen years.

We approve that recommendation and I move its adoption.

Dr. James F Rooney, *Trustee* I second it.

Dr. Joseph A Geis *Essex.* Will free choice to the veteran of the hospital he wants not interfere with the free choice of physician in fact most of the hospitals and advisedly so have closed staffs? Suppose we now grant free choice of the hospital and free choice of physician and the physician he picks cannot work in that particular hospital that he picks? I believe that that should be worded a little better so that the free choice of physician is not sacrificed to free choice of hospital

Speaker Andresen Can you make an amendment to that, Dr Geis to take care of your objection?

Dr. Geis I would suggest that be referred to the Council for clarification. I could not make the necessary amendment off the floor

Speaker Andresen Add to it the clause that it is to be referred to the Council for clarification?

Dr. Geis And giving free choice of hospitals only as far as it is consistent with free choice of physician

Dr Homer J Knickerbocker, *Ontario* I second that amendment.

Dr. Bauckus On the question of the amendment if it is referred to the Council that may take some time for action, and we are soon to meet with the American Hospital Association and with Dr Magnuson on this question In our second resolution we emphasize free choice of physician As I understand it it is the physician who first advocates hospitalization and under our methods of practice he must find a place in the hospital where he can take care of his patient I brought this out yesterday—that at the present time when the doctor wants a patient to go to the hospital the patient does not receive authorization for hospitalization They have stopped that except in an emergency We want the surgeon for example, to have his patient, and take care of him in a hospital, and I think that certainly is indicated in that resolution We don t have free choice of hospital unless we have free choice of physician.

Dr. Geis I will modify that instead of it going to the Council, we refer it to Dr Bauckus organization—I am not sure of its exact name—for such change before they submit it to the Veterans Bureau

Chorus No

Speaker Andresen Is there a second to that?

There was no response

Dr Ezra A. Wolff *Queens* I was going to suggest free choice of type of hospital which I think would not limit them to a single hospital but might allow them to choose a voluntary hospital or proprietary hospital with which their chosen physicians are connected.

Speaker Andresen Do you think that is necessary?

Chorus No

Speaker Andresen The amendment is to refer this to the Council.

Dr. Rooney It seems to me in discussing the amendment that we are going to try to do right here

and now by voice from the floor the amending of something that is very important I cannot quite agree with my good friend, Dr Bauckus, that it is going to take the Council a long time to do it because the Council is going to have to meet after this session, and if it is a clarification of language this thing can be clarified and made conformable to the express wishes of the House in the matter of five minutes I am still in favor of the reference to the Council for clarification of the language and preservation of the intent of the resolution, and referring it to the Council for immediate consideration this afternoon

SPEAKER ANDRESEN The second amendment was not seconded, and the amendment we are considering is the reference to the Council, which has been further amended that it be referred to the Council for clarification of the intent of the resolution and decision this afternoon

DR HENRY We accept that as part of the original motion

The question was called, and the motion was put to a vote and was unanimously carried

DR HENRY Number 7

"That we recommend the formation of a special committee composed of representatives of the veteran organizations, Veterans Administration, and a special committee of the Medical Society of the State of New York for discussion and consideration of veteran hospital and medical care"

We approve that recommendation, and I move its adoption

DR. B M BERNSTEIN, *Kings* I second the motion

There being no discussion, the motion was put to a vote and was unanimously carried

DR HENRY Now I move the adoption of the whole report as amended

DR ROONEY I second it

There being no discussion, the motion was put to a vote and was unanimously carried

Section 140 (*See 14, 137, 174*)

Asking for Reconsideration of War Memorial

DR LEO F SCHIFF, *Clinton* As one who voted for the motion in question, I will now move for the reconsideration of the vote on the War Memorial, and if I may speak for a minute on the reason

SPEAKER ANDRESEN Yes

DR SCHIFF This is a very small group The vote was to my estimation very indecisive We have a great responsibility My purpose in moving for this reconsideration will be to bring before you the question as to the desirability of having a referendum of the Society on the matter, and it is for that reason I make the motion to reconsider

SPEAKER ANDRESEN A motion to reconsider has been made Is there any second?

DR EZRA A WOLFF, *Queens* I will second it

There being no discussion, the motion was put to a vote and was defeated

Section 141

Report of Tellers

SPEAKER ANDRESEN I declare the following elected as Delegates W P Anderton, M D, Albert F R Andresen, M D, James R Reuling, M D, Floyd S Winslow, M D, Herbert H Bauckus, M D, O W H Mitchell, M D, Thomas M Brennan, M D, Ralph T B Todd, M D, Albert A, Gartner, M D, and William B Rawls, M D

And the following elected as alternates in the order of the votes they received Edward D Flood, M D, Leo F Schiff, M D, W Guernsey Frey, Jr, M D, B Wallace Hamilton, M D, Clarence G Bandler, M D, Denver M Vickers, M D, John L Edwards, M D, John T Donovan, M D, Walter T Heldmann, M D, and Eugene H Coon, M D

Section 141 (*See 19, 66*)

Reference Committee on Report of the President

DR PHILIP D ALLEN, *New York* Your Committee notes with approval your President's comments regarding malpractice insurance, but deems no action necessary on our part as it will be completely handled by another committee We note with concern the President's feelings regarding advertising in the NEW YORK STATE JOURNAL OF MEDICINE We feel that publication of the formula should be at least a minimum requirement for advertising accepted by our JOURNAL Members at large are known to disapprove of the advertising policy as presently conducted by the STATE JOURNAL.

The various cultists are at present, as always, clamoring for recognition, and continued vigilance on the part of the State Society is imperative to safeguard the health of the people

Your committee concurs in the need for organizing speakers' bureaus in the various county societies We agree with the President in believing that this is an excellent step in improving our public relations

We realize that attendance at some of the District Branch meetings has been extremely small as compared to the membership Your committee feels that it would be presumptuous to dictate the type of program for each particular district branch as conditions vary so considerably throughout the State However, consideration might be given to a change in the type of program in order to interest a great number of members in some of the district branches

We heartily agree with our President's suggestion regarding division of labor between President and President-Elect in the matter of attending district branch meetings

We agree with the President that the number of trustees should be increased, and we also agree that the tenure of office should be limited to two terms Your committee heartily approves of our President's recommendation that we all support and cooperate with the World Medical Association

In the President's supplementary report he recommends that the Council be empowered to take necessary steps to prepare for emergency defense The motion made by Dr Anderton that the President be empowered to appoint a Committee for National Defense is in line with this thought Your Committee feels that the New York State Medical Society should immediately embark on a plan for emergency medical defense We, therefore, recommend that the House of Delegates empower the Council to participate in this important activity and that the President appoint a committee for disaster preparedness We further recommend that this committee act in conjunction with adjacent state committees to formulate details for mutual emergency medical care

In conclusion, the President's report is most thorough and complete, and we heartily urge that our members familiarize themselves with it

Mr Speaker, I move the report be accepted

DR WILLIAM KLEIN, *Bronx* I second the motion

SPEAKER ANDRESEN There is one point there that I don't think we can consistently vote upon, and

that is the recommendation that the Board of Trustees be increased to nine That was disposed of yesterday

DR. JAMES F ROONEY, *Trustee* I don t think the Committee has many any recommendation in regard to that They approved the President's recommendation.

DR. ALLEN That is right.

DR. ROONEY But the only recommendations they made were two and they were the last two in relation to this question of national defense, so I think the House can perfectly well adopt the report because it does not embody any recommendation

SPEAKER ANDRESEN It embodies approval of something we did not approve yesterday

DR. ROONEY I don't think that is effective because the action has already been taken by the House, and it is not a reconsideration Furthermore it is not a recommendation They merely approve of the proposal. They had an opportunity of discussing it, and they approved it, but I don t think under any circumstances we should eliminate that in courtesy to our President. I am in favor of having it remain as is, and I can see no reason why if the only recommendations they submit for adoption are the two recommendations concerning national defense, those should not be passed upon separately, and then approve the report as a whole.

PRESIDENT BAUER May I comment on my own report? I assure you I have no idea of taking advantage of the recommendations of the Committee

I think the whole thing could be settled very easily if the Committee would just insert, 'but in view of the fact that this matter is being handled by another committee, no action is recommended

DR. PETER J DI NATALE, *Genesee* Was handled by another committee

PRESIDENT BAUER Yes just interpolate those words and that covers it.

DR. ALLEN On behalf of the Committee I insert it.

DR. THOMAS H. MCGAVACK *Section Delegate* You accept it, and I second it.

SPEAKER ANDRESEN There were two recommendations or only one?

DR. ALLEN There were two embodied in the report regarding emergency national defense.

DR. ROONEY One was the matter of the plan and the other was referring it to the Council. There were two separate recommendations.

DR. ALLEN Yes.

SPEAKER ANDRESEN Shall we vote on those separately or shall we vote on them together?

CHORUS Together

SPEAKER ANDRESEN I think we can vote on them together

The question was called, and the motion was put to a vote and was unanimously carried as amended.

Section 148 (*See 8*)

Report of Reference Committee on Report of Planning Committee for Medical Policies

DR. THOMAS M D ANGELO *Queens* The entire report of the Planning Committee for Medical Policies should be required reading for all members of the New York State Medical Society It shows the tremendous amount of work, time, and energy that the officers and committee members give to the Medical Society to protect the interests of the entire membership

This report is divided into six main subdivisions. The first two, namely preamble and organization are essentially the same as when the Committee was created in 1947 Since the committee has carried on its work so smoothly under the present organization, it was not necessary to change that organization.

Section 3 deals with the reorganization of the district branches. This section outlines the history of the formation of the branches and the work that these branches have carried on in the past Their study has shown that in many instances the present organization and activities of the district branches as now constituted do not meet the requirements of organized medicine at the present time. This has brought about the formation of separate organizations in various portions of this State to supplement the work of the district branches. Such organizations are especially active in the Eighth District Branch and the New York City area The Committee has reached no definite conclusion and asked that further and continuous study be made before the organizational setup and geographic redistribution of the district branches is changed Your Reference Committee approves the recommendation of the Planning Committee that 'in those district branches where the interest and sentiment now exist for further functioning of the district branches in serving the interests of its membership a council, or similar body be set up patterned on the successful experiment of the Eighth District Branch It should be so organized as to come within the framework of the Constitution and Bylaws of the State Society It should be carefully administered and supervised so that whatever actions are taken and whatever activities are promoted are cleared at the top through the Council of the State Society Your Reference Committee also approves the recommendation that from time to time appropriate publicity be given this movement in our STATE JOURNAL.

In other words, your Reference Committee recommends that the study be continued.

DR. JAMES F ROONEY *Trustee* I second it.

There being no discussion the motion was put to a vote and was unanimously carried.

DR. D ANGELO Section 4 deals with group practice At the meeting in Buffalo of the House of Delegates in May 1944 there was referred to the Planning Committee by the Council a resolution which asked that a study be made of group practice regulations. The Planning Committee gave this resolution extensive study Your Reference Committee does not intend to outline this study to the House of Delegates. Every member should especially read this portion of the report. The Committee has taken no definite action and made no definite recommendation because the American Medical Association is now studying this matter and some report will be made to the House of Delegates of the American Medical Association in June. The Planning Committee has outlined and codified in a large measure the rules and regulations which now exist concerning group practice One can sense the opinions of the members of the Planning Committee with respect to these rules and regulations but they have wisely refrained from coming to a definite conclusion until the American Medical Association has rendered a report on this subject

With respect to hospitals, medical schools, and private practice the Committee has taken a definite and vigorous stand It views with alarm the formation of group clinics controlled by hospitals and medical schools and the Reference Committee heartily endorses the action of the Planning Committee in vigorously protesting and opposing such activities.

Section 5—Progress of State and County Hospital Construction and Expansion Program This portion of the report is a continuation of the study that the Planning Committee undertook several years ago Very little progress has been made during the past year in New York State to implement the construction and expansion of the State and county hospital program The Committee unanimously approves the decentralization of this program We approve the recommendation that the hospitals constructed under this plan must have a regularly constituted medical board just as in any general hospital, and that all medical policies, staff appointments, ratings, and such other prerogatives and functions as properly belong to a medical board be assigned to the medical board and be their responsibility

I move the adoption of this portion of the report

DR JAMES F ROONEY I second the motion

There being no discussion, the motion was put to a vote and was unanimously carried

DR. D'ANGELO Section 6—Legislation—State and National We approve the recommendation of the Planning Committee that this House of Delegates again reaffirm their policy in opposition to the Wagner-Murray-Dingell Bill and similar legislation which would impose any system of national compulsory sickness insurance and socialized medicine on this country Also that hospital and medical functions within the Federal government be under medical control We also agree with the Planning Committee with regard to the Taft-Smith-Ball-Donnell Bill Number 8545 for their reaffirmation of a recommendation adopted in 1947 that we withhold full approval of the bill and emphasize our agreement with its general philosophy and purposes

I move the adoption of this portion of the report

DR. DWIGHT V NEEDHAM, *Onondaga* I second it

There being no discussion, the motion was put to a vote and was unanimously carried

DR D'ANGELO In conclusion, your Reference Committee wishes again to call the attention of the entire membership of this Society to this important report. It urges the members of this House of Delegates to report to their county societies the contents of this report so that all the members of our Society can be fully acquainted with the policies and recommendations that are embodied in this report

I move the adoption of the report as a whole

DR. GEORGE C ADIF, *Westchester* I second it.

There being no discussion, the motion was put to a vote and was unanimously carried

Section 143 (*See 91*)

Report of Reference Committee on Report of Planning Committee for Medical Policies Redistricting District Branches

DR THOMAS M D'ANGELO *Queens* Resolution presented by Dr S R Monteith, of Rockland, Redistricting District Branches

"WHEREAS, Article 11, Section 3, of the Constitution of the Medical Society of the State of New York states,

'Changes in the number of membership of these district branches may be made by a two-thirds vote of the House of Delegates at any annual meeting',

and

"WHEREAS, the district branches as at present constituted do not include in all instances counties with similar problems in economics and public relations, and

"WHEREAS, the activity of the Eighth District Branch has demonstrated during the past year the organizational value of the district branch, therefore be it

"*Resolved*, that the House of Delegates of the Medical Society of the State of New York refer with power to act to the Council the matter of redistricting the county medical societies into district branches with the creation, if necessary, of a Ninth District Branch"

Your Reference Committee approves this resolution, and I so move

DR. HARRY C GUESS, *Erie* I second the motion

There being no discussion, the motion was put to a vote and was unanimously carried

Section 144 (*See 34*)

Report of Reference Committee on Report of Planning Committee for Medical Policies State Legislation Qualifying Title "Dr"

DR THOMAS M D'ANGELO, *Queens* On the resolution introduced by Dr Frederick A Wurzbach, Jr, reading

"WHEREAS, in the healing arts it has been traditional in America to associate the title 'Dr' with Doctors of Medicine, and

"WHEREAS, in the past decade others than licensed Doctors of Medicine have been misleading the public by the unqualified use of the title 'Dr on signs and stationery, and

"WHEREAS, such common practice is deleterious to the health of the public, therefore be it

"*Resolved*, that it be made mandatory by State law for all licensed practitioners of medicine and the allied healing arts to append to their names the degree which is recognized by license together with the state license number, and be it further

"*Resolved*, that the House of Delegates of the New York State Medical Society direct the Legislative Committee to draft a bill fulfilling the intent of these resolutions and introduce it for enactment into law at the next session of the New York State Legislature"

The Reference Committee has studied this resolution and recommends, first, certain changes in the wording of the resolution In the first "WHEREAS" it adds the word "largely" so that it now reads

"WHEREAS, in the healing arts it has been traditional in America to associate the title 'Dr' largely with doctors of medicine"

It eliminates the second "WHEREAS" entirely because its intent is embodied in the third "WHEREAS" and in the third "WHEREAS" the Committee has changed the word "deleterious" and substituted the word "confusing" so that it now reads

"WHEREAS, such common practice is confusing to the public"

In the first "*Resolved*" portion, the Committee has deleted the word "Medicine" and the word "allied" and it has eliminated that portion which would require a State license number, so that it now reads

"*Resolved*, that it be made mandatory by State law for all licensed practitioners of the healing arts to append to their names the degree which is recognized by license"

Your Committee approves the resolution in principle and refers the matter to the Council for study and implementation I so move

DR HARRY C GUESS, *Erie* I second the motion

DR ROONEY I just briefly want to say that I am

very glad to learn from the chairman of the Reference Committee that the medical profession is the one who in the common mind and in the common language are the only ones entitled to the title Doctor I have found out in the last fifteen years that our actual title is Doc.' One of these recommendations is very valid, the other thing is taken care of in the law of the State of New York, in providing that anybody who uses the title Doctor being unauthorized by an approved degree is guilty of a misdemeanor It is not enforced but there it is

The second thing is this I think one of the recommendations they make is most important that if the title of Doctor is used—and you know gentlemen we have an enormous number of doctors of philosophy who like to appear not alone to the public but to congressional hearings and the like as doctors of medicine—you should use 'Medical Doctor or Doctor of Medicine I think that the American Medical Association should take some cognizance of this thing and something should be done about it I heartily approve of the proposal of the Committee

There being no further discussion the motion was put to a vote and was unanimously carried

Section 145 (*See 39*)

Report of Reference Committee on Report of Planning Committee for Medical Policies U S Participation in the World Health Organization

DR. THOMAS M. D ANGELO *Queens* On the resolution introduced by Dr Reginald A Higgons, of Westchester County Medical Society on United States Participation in the World Health Organization

'WHEREAS the World Health Organization was created under the auspices of the United Nations to meet medical and health problems on an international scale and

'WHEREAS with present day means of transportation diseases or epidemics in one part of the world are a menace to all other parts and

"WHEREAS the bill to provide United States participation in the World Health Organization was passed by the Senate (S.J Res 93) last July and reported favorably by the House Foreign Affairs Committee (H.J Res. 161) and

"WHEREAS on March 12 by a vote of 5 to 2 the House Rules Committee decided not to bring this bill before the House for action and

WHEREAS, this bill is still withheld by the House Rules Committee and

'WHEREAS, prompt action must be taken if the United States is to participate in the first assembly of the World Health Organization to be held in Geneva during June now therefore be it

'RESOLVED, that the House Rules Committee be petitioned by the Medical Society of the State of New York to present this bill for a vote by the House of Representatives in order that the leadership of American Medicine and Public Health may have its rightful voice in dealing with international health problems.

Your Reference Committee approves this resolution, and I so move

DR. DWIGHT V NEEDHAM *Onondaga* I second the motion

There being no discussion the motion was put to a vote and was unanimously carried

Section 146 (*See 35*)

Report of Reference Committee on Report of Planning Committee for Medical Policies Creation of a Junior Membership Classification in County Societies and State Medical Societies on Reduced Assessment Basis
